(a) The first problem confronting an analyst who is treating more than one patient in the day will seem to him the hardest. It is the task of keeping in mind all the innumerable names, dates, detailed memories and pathological products which each patient communicates in the course of months and years of treatment, and of not confusing them with similar material produced by other patients under treatment simultaneously or previously. If one is required to analyse six, eight, or even more patients daily, the feat of memory involved in achieving this will provoke incredulity, astonishment or even commiseration in uninformed observers. Curiosity will in any case be felt about the technique which makes it possible to master such an abundance of material, and the expectation will be that some special expedients are required for the purpose.

The technique, however, is a very simple one. As we shall see, it rejects the use of any special expedient (even that of taking notes). It consists simply in not directing one's notice to anything in particular and in maintaining the same 'evenly-suspended attention' (as I have called it) in the face of all that one hears. In this way we spare ourselves a strain on our attention which could not in any case be kept up for several hours daily, and we avoid a danger which is inseparable from the exercise of deliberate attention. For as soon as anyone deliberately concentrates his attention to a certain degree, he begins to select from the material before him; one point will be fixed in his mind with particular clearness and some other will be correspondingly disregarded, and in making this selection he will be following his expectations or inclinations. This, however, is precisely what must not be done. In making the selection, if he follows his expectations he is in danger of never finding anything but what he already knows; and if he follows his inclinations he will certainly falsify what he may perceive. It must not be forgotten that the things one hears are for the most part things whose meaning is only recognized later on.

It will be seen that the rule of giving equal notice to everything is the necessary counterpart to the demand made on the patient that he should communicate everything that occurs to him without criticism or selection. If the doctor behaves otherwise, he is throwing away most of the advantage which results from the patient's obeying the 'fundamental rule of psycho- analysis'. The rule for the doctor may be expressed: 'He should withhold all conscious influences from his capacity to attend, and give himself over completely to his "unconscious memory".' Or, to put it purely in terms of technique: 'He should simply listen, and not bother about whether he is keeping anything in mind.'

What is achieved in this manner will be sufficient for all requirements during the treatment. Those elements of the material which already form a connected context will be at the doctor's conscious disposal; the rest, as yet unconnected and in chaotic disorder, seems at first to be submerged, but rises readily into recollection as soon as the patient brings up something new to which it can be related and by which it can be continued. The undeserved compliment of having 'a remarkably good memory' which the patient pays one when one reproduces some detail after a year and a day can then be accepted with a smile, whereas a conscious determination to recollect the point would probably have resulted in failure. Mistakes in this process of remembering occur only at times and places at which one is disturbed by some personal consideration (see below) - that is, when one has fallen seriously below the standard of an ideal analyst. Confusion with material brought up by other patients occurs very rarely. Where there is a dispute with the patient as to whether or how he has said some particular thing, the doctor is usually in the right.¹

¹ A patient will often assert that he has already told the doctor something on a previous occasion, while the doctor can assure him with a quiet feeling of superiority that it has come up now for the first time. It then turns out that the patient had previously had the intention of saying it, but had been prevented from performing his intention by a resistance which was still present. His recollection of his intention is indistinguishable to him from a recollection of its performance.

(b) I cannot advise the taking of full notes, the keeping of a shorthand record, etc., during analytic sessions. Apart from the unfavourable impression which this makes on some patients, the same considerations as have been advanced with regard to attention apply here too. A detrimental selection from the material will necessarily be made as one writes the notes or shorthand, and part of one's own mental activity is tied up in this way, which would be better employed in interpreting what one has heard. No objection can be raised to making exceptions to this rule in the case of dates, the text of dreams, or particular noteworthy events which can easily be detached from their context and are suitable for independent use as instances. But I am not in the habit of doing this either. As regards instances, I write them down from memory in the evening after work is over; as regards texts of dreams to which I attach importance, I get the patient to repeat them to me after he has related them so that I can fix them in my mind.

(c) Taking notes during the session with the patient might be justified by an intention of publishing a scientific study of the case. On general grounds this can scarcely be denied. Nevertheless it must be borne in mind that exact reports of analytic case histories are of less value than might be expected. Strictly speaking, they only possess the *ostensible* exactness of which 'modern' psychiatry affords us some striking examples. They are, as a rule, fatiguing to the reader and yet do not succeed in being a substitute for his actual presence at an analysis. Experience invariably shows that if readers are willing to believe an analyst they will have confidence in any slight revision to which he has submitted his material; if, on the other hand, they are unwilling to take analysis and the analyst seriously, they will pay no attention to accurate verbatim records of the treatment either. This is not the way, it seems, to remedy the lack of convincing evidence to be found in psycho-analytic reports.

(d) One of the claims of psycho-analysis to distinction is, no doubt, that in its execution research and treatment coincide; nevertheless, after a certain point, the technique required for the one opposes that required for the other. It is not a good thing to work on a case scientifically while treatment is still proceeding - to piece together its structure, to try to foretell its further progress, and to get a picture from time to time of the current state of affairs, as scientific interest would demand. Cases which are devoted from the first to scientific purposes and are treated accordingly suffer in their outcome; while the most successful cases are those in which one proceeds, as it were, without any purpose in view, allows oneself to be taken by surprise by any new turn in them, and always meets them with an open mind, free from any presuppositions. The correct behaviour for an analyst lies in swinging over according to need from the one mental attitude to the other, in avoiding speculation or brooding over cases while they are in analysis, and in submitting the material obtained to a synthetic process of thought only after the analysis is concluded. The distinction between the two attitudes would be meaningless if we already possessed all the knowledge (or at least the essential knowledge) about the psychology of the unconscious and about the structure of the neuroses that we can obtain from psycho-analytic work. At present we are still far from that goal and we ought not to cut ourselves off from the possibility of testing what we have already learnt and of extending our knowledge further.

(e) I cannot advise my colleagues too urgently to model themselves during psycho-analytic treatment on the surgeon, who puts aside all his feelings, even his human sympathy, and concentrates his mental forces on the simple aim of performing the operation as skilfully as possible. Under present-day conditions the feeling that is most dangerous to a psycho-analyst is the therapeutic ambition to achieve by this novel and much disputed method something that will produce a convincing effect upon other people. This will not only put him into a state of mind which is unfavourable for his work, but will make him helpless against certain resistances of the patient, whose recovery, as we know, primarily depends on the interplay of forces in him. The justification for requiring this emotional coldness in the analyst is that it creates the most advantageous conditions for both parties: for the doctor a desirable protection for his own emotional life and for the patient the largest amount of help that we can give him to-day. A surgeon of earlier times took as his motto the words: 'Je le pansai, Dieu le guérit.'¹ The analyst should be content with something similar.

(f) It is easy to see upon what aim the different rules I have brought forward converge. They are all intended to create for the doctor a counterpart to the 'fundamental rule of psycho-analysis' which is laid down for the patient. Just as the patient must relate everything that his self-observation can detect, and keep back all the logical and affective objections that seek to induce him to make a selection from among them, so the doctor must put himself in a position to make use of everything he is told for the purposes of interpretation and of recognizing the concealed unconscious material without substituting a censorship of his own for the selection that the patient has forgone. To put it in a formula: he must turn his own unconscious like a receptive organ towards the transmitting unconscious of the patient. He must adjust himself to the patient as a telephone receiver is adjusted to the transmitting microphone. Just as the receiver converts back into sound waves the electric oscillations in the telephone line which were set up by sound waves, so the doctor's unconscious is able, from the derivatives of the unconscious which are communicated to him, to reconstruct that unconscious, which has determined the patient's free associations.

¹ ['I dressed his wounds, God cured him.']

But if the doctor is to be in a position to use his unconscious in this way as an instrument in the analysis, he must himself fulfil one psychological condition to a high degree. He may not tolerate any resistances in himself which hold back from his consciousness what has been perceived by his unconscious; otherwise he would introduce into the analysis a new species of selection and distortion which would be far more detrimental than that resulting from concentration of conscious attention. It is not enough for this that he himself should be an approximately normal person. It may be insisted, rather, that he should have undergone a psycho-analytic purification and have become aware of those complexes of his own which would be apt to interfere with his grasp of what the patient tells him. There can be no reasonable doubt about the disqualifying effect of such defects in the doctor; every unresolved repression in him constitutes what has been aptly described by Stekel as a 'blind spot' in his analytic perception.

Some years ago I gave as an answer to the question of how one can become an analyst: 'By analysing one's own dreams.' This preparation is no doubt enough for many people, but not for everyone who wishes to learn analysis. Nor can everyone succeed in interpreting his own dreams without outside help. I count it as one of the many merits of the Zurich school of analysis that they have laid increased emphasis on this requirement, and have embodied it in the demand that everyone who wishes to carry out analyses on other people shall first himself undergo an analysis by someone with expert knowledge. Anyone who takes up the work seriously should choose this course, which offers more than one advantage; the sacrifice involved in laying oneself open to another person without being driven to it by illness is amply rewarded. Not only is one's aim of learning to know what is hidden in one's own mind far more rapidly attained and with less expense of affect, but impressions and convictions will be gained in relation to oneself which will be sought in vain from studying books and attending lectures. And lastly, we must not under-estimate the advantage to be derived from the lasting mental contact that is as a rule established between the student and his guide.

An analysis such as this of someone who is practically healthy will, as may be imagined, remain incomplete. Anyone who can appreciate the high value of the self-knowledge and increase in self-control thus acquired will, when it is over, continue the analytic examination of his personality in the form of a self-analysis, and be content to realize that, within himself as well as in the external world, he must always expect to find something new. But anyone who has scorned to take the precaution of being analysed himself will not merely be punished by being incapable of learning more than a certain amount from his patients, he will risk a more serious danger and one which may become a danger to others. He will easily fall into the temptation of projecting outwards some of the peculiarities of his own personality, which he has dimly perceived, into the field of science, as a theory having universal validity; he will bring the psycho-analytic method into discredit, and lead the inexperienced astray.

(g) I shall now add a few other rules, that will serve as a transition from the attitude of the doctor to the treatment of the patient.

Young and eager psycho-analysts will no doubt be tempted to bring their own individuality freely into the discussion, in order to carry the patient along with them and lift him over the barriers of his own narrow personality. It might be expected that it would be quite allowable and indeed useful, with a view to overcoming the patient's existing resistances, for the doctor to afford him a glimpse of his own mental defects and conflicts and, by giving him intimate information about his own life, enable him to put himself on an equal footing. One confidence deserves another, and anyone who demands intimacy from someone else must be prepared to give it in return.

But in psycho-analytic relations things often happen differently from what the psychology of consciousness might lead us to expect. Experience does not speak in favour of an affective technique of this kind. Nor is it hard to see that it involves a departure from psycho-analytic principles and verges upon treatment by suggestion. It may induce the patient to bring forward sooner and with less difficulty things he already knows but would otherwise have kept back for a time through conventional resistances. But this technique achieves nothing towards the uncovering of what is unconscious to the patient. It makes him even more incapable of overcoming his deeper resistances, and in severer cases it invariably fails by encouraging the patient to be insatiable: he would like to reverse the situation, and finds the analysis of the doctor more interesting than his own. The resolution of the transference, too - one of the main tasks of the treatment - is made more difficult by an intimate attitude on the doctor's part, so that any gain there may be at the beginning is more than outweighed at the end. I have no hesitation, therefore, in condemning this kind of technique as incorrect. The doctor should be opaque to his patients and, like a mirror, should show them nothing but what is shown to him. In practice, it is true, there is nothing to be said against a psychotherapist combining a certain amount of analysis with some suggestive influence in order to achieve a perceptible result in a shorter time - as is necessary, for instance, in institutions. But one has a right to insist that he himself should be in no doubt about what he is doing and should know that his method is not that of true psycho-analysis.

(h) Another temptation arises out of the educative activity which, in psycho-analytic treatment, devolves on the doctor without any deliberate intention on his part. When the developmental inhibitions are resolved, it happens of itself that the doctor finds himself in a position to indicate new aims for the trends that have been liberated. It is then no more than a natural ambition if he endeavours to make something specially excellent of a person whom he has been at such pains to free from his neurosis and if he prescribes high aims for his wishes. But here again the doctor should hold himself in check, and take the patient's capacities rather than his own desires as guide. Not every neurotic has a high talent for sublimation; one can assume of many of them that they would not have fallen ill at all if they had possessed the art of sublimating their instincts. If we press them unduly towards sublimation and cut them off from the most accessible and convenient instinctual satisfactions, we shall usually make life even harder for them than they feel it in any case. As a doctor, one must above all be tolerant to the weakness of a patient, and must be content if one has won back some degree of capacity for work and enjoyment for a person even of only moderate worth. Educative ambition is of as little use as therapeutic ambition. It must further be borne in mind that many people fall ill precisely from an attempt to sublimate their instincts beyond the degree permitted by their organization and that in those who have a capacity for sublimation the process usually takes place of itself as soon as their inhibitions have been overcome by analysis. In my opinion, therefore, efforts invariably to make use of the analytic treatment to bring about sublimation of instinct are, though no doubt always laudable, far from being in every case advisable.

(i) To what extent should the patient's intellectual co-operation be sought for in the treatment? It is difficult to say anything of general applicability on this point: the patient's personality is the determining factor. But in any case caution and self-restraint must be observed in this connection. It is wrong to set a patient tasks, such as collecting his memories or thinking over some particular period of his life. On the contrary, he has to learn above all - what never comes easily to anyone - that mental activities such as thinking something over or concentrating the attention solve none of the riddles of a neurosis; that can only be done by patiently obeying the psycho-analytic rule, which enjoins the exclusion of all criticism of the unconscious or of its derivatives. One must be especially unyielding about obedience to that rule with patients who practise the art of sheering off into intellectual discussion during their treatment, who speculate a great deal and often very wisely about their condition and in that way avoid doing anything to overcome it. For this reason I dislike making use of analytic writings as an assistance to my patients; I require them to learn by personal experience, and I assure them that they will acquire wider and more valuable knowledge than the whole literature of psycho-analysis could teach them. I recognize, however, that under institutional conditions it may be of great advantage to employ reading as a preparation for patients in analysis and as a means of creating an atmosphere of influence.

I must give a most earnest warning against any attempt to gain the confidence or support of parents or relatives by giving them psycho-analytic books to read, whether of an introductory or an advanced kind. This well-meant step usually has the effect of bringing on prematurely the natural opposition of the relatives to the treatment - an opposition which is bound to appear sooner or later - so that the treatment is never even begun.

Let me express a hope that the increasing experience of psycho-analysts will soon lead to agreement on questions of technique and on the most effective method of treating neurotic patients. As regards the treatment of their relatives I must confess myself utterly at a loss, and I have in general little faith in any individual treatment of them.

ON BEGINNING THE TREATMENT
(FURTHER RECOMMENDATIONS ON THE TECHNIQUE OF PSYCHO-ANALYSIS I)
(1913)

Intentionally left blank

ON BEGINNING THE TREATMENT (FURTHER RECOMMENDATIONS ON THE TECHNIQUE OF PSYCHO-ANALYSIS I)

Anyone who hopes to learn the noble game of chess from book will soon discover that only the openings and end-games admit of an exhaustive systematic presentation and that the infinite variety of moves which develop after the opening defy any such description. This gap in instruction can only be filled by a diligent study of games fought out by masters. The rules which can be laid down for the practice of psycho-analytic treatment are subject to similar limitations.

In what follows I shall endeavour to collect together for the use of practising analysts some of the rules for the beginning of the treatment. Among them there are some which may seem to be petty details, as, indeed, they are. Their justification is that they are simply rules of the game which acquire their importance from their relation to the general plan of the game. I think I am well-advised, however, to call these rules 'recommendations' and not to claim any unconditional acceptance for them. The extraordinary diversity of the psychical constellations concerned, the plasticity of all mental processes and the wealth of determining factors oppose any mechanization of the technique; and they bring it about that a course of action that is as a rule justified may at times prove ineffective, whilst one that is usually mistaken may once in a while lead to the desired end. These circumstances, however, do not prevent us from laying down a procedure for the physician which is effective on the average.

Some years ago I set out the most important indications for selecting patients¹ and I shall therefore not repeat them here. They have in the meantime been approved by other psycho-analysts. But I may add that since then I have made it my habit, when I know little about a patient, only to take him on at first provisionally, for a period of one to two weeks. If one breaks off within this period one spares the patient the distressing impression of an attempted cure having failed. One has only been undertaking a 'sounding' in order to get to know the case and to decide whether it is a suitable one for psycho-analysis. No other kind of preliminary examination but this procedure is at our disposal; the most lengthy discussions and questionings in ordinary consultations would offer no substitute. This preliminary experiment, however, is itself the beginning of a psycho-analysis and must conform to its rules. There may perhaps be this distinction made, that in it one lets the patient do nearly all the talking and explains nothing more than what is absolutely necessary to get him to go on with what he is saying.

¹ 'On Psychotherapy' (1905a).

There are also diagnostic reasons for beginning the treatment with a trial period of this sort lasting for one or two weeks. Often enough, when one sees a neurosis with hysterical or obsessional symptoms, which is not excessively marked and has not been in existence for long - just the type of case, that is, that one would regard as suitable for treatment - one has to, reckon with the possibility that it may be a preliminary stage of what is known as dementia praecox ('schizophrenia', in Bleuler's terminology; 'paraphrenia', as I have proposed to call it), and that sooner or later it will show a well-marked picture of that affection. I do not agree that it is always possible to make the distinction so easily. I am aware that there are psychiatrists who hesitate less often in their differential diagnosis, but I have become convinced that just as often they make mistakes. To make a mistake, moreover, is of far greater moment for the psycho-analyst than it is for the clinical psychiatrist, as he is called. For the latter is not attempting to do anything that will be of use, whichever kind of case it may be. He merely runs the risk of making a theoretical mistake, and his diagnosis is of no more than academic interest. Where the psycho-analyst is concerned, however, if the case is unfavourable he has committed a practical error; he has been responsible for wasted expenditure and has discredited his method of treatment. He cannot fulfil his promise of cure if the patient is suffering, not from hysteria or obsessional neurosis, but from paraphrenia, and he therefore has particularly strong motives for avoiding mistakes in diagnosis. In an experimental treatment of a few weeks he will often observe suspicious signs which may determine him not to pursue the attempt any further. Unfortunately I cannot assert that an attempt of this kind always enables us to arrive at a certain decision; it is only one wise precaution the more.¹

¹ There is a great deal to be said about this uncertainty in diagnosis, about the prospects of success in analysing mild forms of paraphrenia and about the reasons for the similarity between the two disorders; but I cannot enlarge on these subjects in the present context. I should be glad to follow Jung in contrasting hysteria and obsessional neurosis as 'transference neuroses' with the paraphrenic affections as 'introversion neuroses', if it were not that such a usage would deprive the concept of 'introversion' (of the libido) of its sole legitimate meaning.

Lengthy preliminary discussions before the beginning of the analytic treatment, previous treatment by another method and also previous acquaintance between the doctor and the patient who is to be analysed, have special disadvantageous consequences for which one must be prepared. They result in the patient's meeting the doctor with a transference attitude which is already established and which the doctor must first slowly uncover instead of having the opportunity to observe the growth and development of the transference from the outset. In this way the patient gains a temporary start upon us which we do not willingly grant him in the treatment.

One must mistrust all prospective patients who want to make a delay before beginning their treatment. Experience shows that when the time agreed upon has arrived they fail to put in an appearance, even though the motive for the delay - i.e. their rationalization of their intention - seems to the uninitiated to be above suspicion.

Special difficulties arise when the analyst and his new patient or their families are on terms of friendship or have social ties with one another. The psycho-analyst who is asked to undertake the treatment of the wife or child of a friend must be prepared for it to cost him that friendship, no matter what the outcome of the treatment may be: nevertheless he must make the sacrifice if he cannot find a trustworthy substitute.

Both lay public and doctors - still ready to confuse psycho-analysis with treatment by suggestion - are inclined to attribute great importance to the expectations which the patient brings to the new treatment. They often believe in the case of one patient that he will not give much trouble, because he has great confidence in psycho-analysis and is fully convinced of its truth and efficacy; whereas in the case of another, they think that he will undoubtedly prove more difficult, because he has a sceptical outlook and will not believe anything until he has experienced its successful results on his own person. Actually, however, this attitude on the part of the patient has very little importance. His initial trust or distrust is almost negligible compared with the internal resistances which hold the neurosis firmly in place. It is true that the patient's happy trustfulness makes our earliest relationship with him a very pleasant one; we are grateful to him for that, but we warn him that his favourable prepossession will be shattered by the first difficulty that arises in the analysis. To the sceptic we say that the analysis requires no faith, that he may be as critical and suspicious as he pleases and that we do not regard his attitude as the effect of his judgement at all, for he is not in a position to form a reliable judgement on these matters; his distrust is only a symptom like his other symptoms and it will not be an interference, provided he conscientiously carries out what the rule of the treatment requires of him.

No one who is familiar with the nature of neurosis will be astonished to hear that even a man who is very well able to carry out an analysis on other people can behave like any other mortal and be capable of producing the most intense resistances as soon as he himself becomes the object of analytic investigation. When this happens we are once again reminded of the dimension of depth in the mind, and it does not surprise us to find that the neurosis has its roots in psychical strata to which an intellectual knowledge of analysis has not penetrated.

Points of importance at the beginning of the analysis are arrangements about *time* and *money*.

In regard to time, I adhere strictly to the principle of leasing a definite hour. Each patient is allotted a particular hour of my available working day; it belongs to him and he is liable for it, even if he does not make use of it. This arrangement, which is taken as a matter of course for teachers of music or languages in good society, may perhaps seem too rigorous in a doctor, or even unworthy of his profession. There will be an inclination to point to the many accidents which may prevent the patient from attending every day at the same hour and it will be expected that some allowance shall be made for the numerous intercurrent ailments which may occur in the course of a longish analytic treatment. But my answer is: no other way is practicable. Under a less stringent régime the 'occasional' non-attendances increase so greatly that the doctor finds his material existence threatened; whereas when the arrangement is adhered to, it turns out that accidental hindrances do not occur at all and intercurrent illnesses only very seldom. The analyst is hardly ever put in the position of enjoying a leisure hour which he is paid for and would be ashamed of; and he can continue his work without interruptions, and is spared the distressing and bewildering experience of finding that a break for which he cannot blame himself is always bound to happen just when the work promises to be especially important and rich in content. Nothing brings home to one so strongly the significance of the psychogenic factor in the daily life of men, the frequency of malingering and the non-existent of chance, as a few years' practice of psycho-analysis on the strict principle of leasing by the hour. In cases of undoubted organic illnesses, which, after all, cannot be excluded by the patient's having a psychical interest in attending, I break off the treatment, consider myself entitled to dispose elsewhere of the hour which becomes free, and take the patient back again as soon as he has recovered and I have another hour vacant.

I work with my patients every day except on Sundays and public holidays - that is, as a rule, six days a week. For slight cases or the continuation of a treatment which is already well advanced, three days a week will be enough. Any restrictions of time beyond this bring no advantage either to the doctor or the patient; and at the beginning of an analysis they are quite out of the question. Even short interruptions have a slightly, obscuring effect on the work. We used to speak jokingly of the 'Monday crust' when we began work again after the rest on Sunday. When the hours of work are less frequent, there is a risk of not being able to keep pace with the patient's real life and of the treatment losing contact with the present and being forced into by-paths. Occasionally, too, one comes across patients to whom one must give more than the average time of one hour a day, because the best part of an hour is gone before they begin to open up and to become communicative at all.

An unwelcome question which the patient asks the doctor at the outset is: 'How long will the treatment take? How much time will you need to relieve me of my trouble?' If one has proposed a trial treatment of a few weeks one can avoid giving a direct answer to this question by promising to make a more reliable pronouncement at the end of the trial period. Our answer is like the answer given by the Philosopher to the Wayfarer in Aesop's fable. When the Wayfarer asked how long a journey lay ahead, the Philosopher merely answered 'Walk!' and afterwards explained his apparently unhelpful reply on the ground that he must know the length of the Wayfarer's stride before he could tell how long his journey would take. This expedient helps one over the first difficulties; but the comparison is not a good one, for the neurotic can easily alter his pace and may at times make only very slow progress. In point of fact, the question as to the probable duration of a treatment is almost unanswerable.

As the combined result of lack of insight on the part of patients and disingenuousness on the part of doctors, analysis finds itself expected to fulfil the most boundless demands, and that in the shortest time. Let me, as an example, give some details from a letter which I received a few days ago from a lady in Russia. She is 53 years old, her illness began twenty-three years ago and for the last ten years she has no longer been able to do any continuous work. 'Treatment in a number of institutions for nervous cases' have not succeeded in making an 'active life' possible for her. She hopes to be completely cured by psycho-analysis, which she has read about, but her illness has already cost her family so much money that she cannot manage to come to Vienna for longer than six weeks or two months. Another added difficulty is that she wishes from the very start to 'explain' herself in writing only, since any discussion of her complexes would cause an explosion of feeling in her or 'render her temporarily unable to speak'. - No one would expect a man to lift a heavy table with two fingers as if it were a light stool, or to build a large house in the time it would take to put up a wooden hut; but as soon as it becomes a question of the neuroses - which do not seem so far to have found a proper place in human thought - even intelligent people forget that a necessary proportion must be observed between time, work and success. This, incidentally, is an understandable result of the deep ignorance which prevails about the aetiology of the neuroses. Thanks to this ignorance, neurosis is looked on as a kind of 'maiden from afar'. 'None knew whence she came'; so they expected that one day she would vanish.

Doctors lend support to these fond hopes. Even the informed among them often fail to estimate properly the severity of nervous disorders. A friend and colleague of mine, to whose great credit I account it that after several decades of scientific work on other principles he became converted to the merits of psycho-analysis, once wrote to me: 'What we need is a short, convenient, out-patient treatment for obsessional neurosis.' I could not supply him with it and felt ashamed; so I tried to excuse myself with the remark that specialists in internal diseases, too, would probably be very glad of a treatment for tuberculosis or carcinoma which combined these advantages.

To speak more plainly, psycho-analysis is always a matter of long periods of time, of half a year or whole years - of longer periods than the patient expects. It is therefore our duty to tell the patient this before he finally decides upon the treatment. I consider it altogether more honourable, and also more expedient, to draw his attention - without trying to frighten him off, but at the very beginning - to the difficulties and sacrifices which analytic treatment involves, and in this way to deprive him of any right to say later on that he has been inveigled into a treatment whose extent and implications he did not realize. A patient who lets himself be dissuaded by this information would in any case have shown himself unsuitable later on. It is a good thing to institute a selection of this kind before the beginning of the treatment. With the progress of understanding among patients the number of those who successfully meet this first test increases.

I do not bind patients to continue the treatment for a certain length of time; I allow each one to break off whenever he likes. But I do not hide it from him that if the treatment is stopped after only a small amount of work has been done it will not be successful and may easily, like an unfinished operation, leave him in an unsatisfactory state. In the early years of my psycho-analytic practice I used to have the greatest difficulty in prevailing on my patients to continue their analysis. This difficulty has long since been shifted, and I now have to take the greatest pains to induce them to give it up.

To shorten analytic treatment is a justifiable wish, and its fulfilment, as we shall learn, is being attempted along various lines. Unfortunately, it is opposed by a very important factor, namely, the slowness with which deep-going changes in the mind are accomplished - in the last resort, no doubt, the 'timelessness' of our unconscious processes. When patients are faced with the difficulty of the great expenditure of time required for analysis they not infrequently manage to propose a way out of it. They divide up their ailments and describe some as unbearable, and others as secondary, and then say: 'If only you will relieve me from this one (for instance, a headache or a particular fear) I can deal with the other one on my own in my ordinary life.' In doing this, however, they over-estimate the selective power of analysis. The analyst is certainly able to do a great deal, but he cannot determine beforehand exactly what results he will effect. He sets in motion a process, that of the resolving of existing repressions. He can supervise this process, further it, remove obstacles in its way, and he can undoubtedly vitiate much of it. But on the whole, once begun, it goes its own way and does not allow either the direction it takes or the order in which it picks up its points to be prescribed for it. The analyst's power over the symptoms of the disease may thus be compared to male sexual potency. A man can, it is true, beget a whole child, but even the strongest man cannot create in the female organism a head alone or an arm or a leg; he cannot even prescribe the child's sex. He, too, only sets in motion a highly complicated process, determined by events in the remote past, which ends with the severance of the child from its mother. A neurosis as well has the character of an organism. Its component manifestations are not independent of one another; they condition one another and give one another mutual support. A person suffers from one neurosis only, never from several which have accidentally met together in a single individual. The patient freed, according to his wish, from his one unendurable symptom might easily find that a symptom which had previously been negligible had now increased and grown unendurable. The analyst who wishes the treatment to owe its success as little as possible to its elements of suggestion (i.e. to the transference) will do well to refrain from making use of even the trace of selective influence upon the results of the therapy which may perhaps be open to him. The patients who are bound to be most welcome to him are those who ask him to give them complete health, in so far as that is attainable, and who place as much time at his disposal as is necessary for the process of recovery. Such favourable conditions as these are, of course, to be looked for in only a few cases.

The next point that must be decided at the beginning of the treatment is the one of money, of the doctor's fee. An analyst does not dispute that money is to be regarded in the first instance as a medium for self-preservation and for obtaining power; but he maintains that, besides this, powerful sexual factors are involved in the value set upon it. He can point out the money matters are treated by civilized people in the same way as sexual matters - with the same inconsistency, prudishness and hypocrisy. The analyst is therefore determined from the first not to fall in with this attitude, but, in his dealings with his patients, to treat of money matters with the same matter-of-course frankness to which he wishes to educate them in things relating to sexual life. He shows them that he himself has cast off false shame on these topics, by voluntarily telling them the price at which he values his time. Ordinary good sense cautions him, furthermore, not to allow large sums of money to accumulate, but to ask for payment at fairly short regular intervals - monthly, perhaps. (It is a familiar fact that the value of the treatment is not enhanced in the patient's eyes if a very low fee is asked.) This is, of course, not the usual practice of nerve specialists or other physicians in our European society. But the psycho-analyst may put himself in the position of a surgeon, who is frank and expensive because he has at his disposal methods of treatment which can be of use. It seems to me more respectable and ethically less objectionable to acknowledge one's actual claims and needs rather than, as is still the practice among physicians, to act the part of the disinterested philanthropist - a position which one is not, in fact, able to fill, with the result that one is secretly aggrieved, or complains aloud, at the lack of consideration and the desire for exploitation evinced by one's patients. In fixing his fee the analyst must also allow for the fact that, hard as he may work, he can never earn as much as other medical specialists.

For the same reason he should also refrain from giving treatment free, and make no exceptions to this in favour of his colleagues or their families. This last recommendation will seem to offend against professional amenities. It must be remembered, however, that a gratuitous treatment means much more to a psychoanalyst than to any other medical man; it means the sacrifice of a considerable portion - an eighth or a seventh part, perhaps - of the working time available to him for earning his living, over a period of many months. A second free treatment carried on at the same time would already deprive him of a quarter or a third of his earning capacity, and this would be comparable to the damage inflicted by a severe accident.

The question then arises whether the advantage gained by the patient would not to some extent counterbalance the sacrifice made by the physician. I may venture to form a judgement about this, since for ten years or so I set aside one hour a day, and sometimes two, for gratuitous treatments, because I wanted, in order to find my way about in the neuroses, to work in the face of as little resistance as possible. The advantages I sought by this means were not forthcoming. Free treatment enormously increases some of a neurotic's resistances - in young women, for instance, the temptation which is inherent in their transference-relation, and in young men, their opposition to an obligation to feel grateful, an opposition which arises from their father-complex and which presents one of the most troublesome hindrances to the acceptance of medical help. The absence of the regulating effect offered by the payment of a fee to the doctor makes itself very painfully felt; the whole relationship is removed from the real world, and the patient is deprived of a strong motive for endeavouring to bring the treatment to an end.

One may be very far from the ascetic view of money as a curse and yet regret that analytic therapy is almost inaccessible to poor people, both for external and internal reasons. Little can be done to remedy this. Perhaps there is truth in the widespread belief that those who are forced by necessity to a life of hard toil are less easily overtaken by neurosis. But on the other hand experience shows without a doubt that when once a poor man has produced a neurosis it is only with difficulty that he lets it be taken from him. It renders him too good a service in the struggle for existence; the secondary gain from illness which it brings him is much too important. He now claims by right of his neurosis the pity which the world has refused to his material distress, and he can now absolve himself from the obligation of combating his poverty by working. Anyone therefore who tries to deal with the neurosis of a poor person by psychotherapy usually discovers that what is here required of him is a practical therapy of a very different kind - the kind which, according to our local tradition, used to be dispensed by the Emperor Joseph II. Naturally, one does occasionally come across deserving people who are helpless from no fault of their own, in whom unpaid treatment does not meet with any of the obstacles that I have mentioned and in whom it leads to excellent results.

As far as the middle classes are concerned, the expense involved in psycho-analysis is excessive only in appearance. Quite apart from the fact that no comparison is possible between restored health and efficiency on the one hand and a moderate financial outlay on the other, when we add up the unceasing costs of nursing-homes and medical treatment and contrast them with the increase of efficiency and earning capacity which results from a successfully completed analysis, we are entitled to say that the patients have made a good bargain. Nothing in life is so expensive as illness - and stupidity.

Before I wind up these remarks on beginning analytic treatment, I must say a word about a certain ceremonial which concerns the position in which the treatment is carried out. I hold to the plan of getting the patient to lie on a sofa while I sit behind him out of his sight. This arrangement has a historical basis; it is the remnant of the hypnotic method out of which psycho-analysis was evolved. But it deserves to be maintained for many reasons. The first is a personal motive, but one which others may share with me. I cannot put up with being stared at by other people for eight hours a day (or more). Since, while I am listening to the patient, I, too, give myself over to the current of my unconscious thoughts, I do not wish my expressions of face to give the patient material for interpretations or to influence him in what he tells me. The patient usually regards being made to adopt this position as a hardship and rebels against it, especially if the instinct for looking (scopophilia) plays an important part in his neurosis. I insist on this procedure, however, for its purpose and result are to prevent the transference from mingling with the patient's associations imperceptibly, to isolate the transference and to allow it to come forward in due course sharply defined as a resistance. I know that many analysts work in a different way, but I do not know whether this deviation is due more to a craving for doing things differently or to some advantage which they find they gain by it.

The conditions of treatment having been regulated in this manner, the question arises at what point and with what material is the treatment to begin?

What the material is with which one starts the treatment is on the whole a matter of indifference - whether it is the patient's life-history or the history of his illness or his recollections of childhood. But in any case the patient must be left to do the talking and must be free to choose at what point he shall begin. We therefore say to him: 'Before I can say anything to you I must know a great deal about you; please tell me what you know about yourself.'

The only exception to this is in regard to the fundamental rule of psycho-analytic technique which the patient has to observe. This must be imparted to him at the very beginning: 'One more thing before you start. What you tell me must differ in one respect from an ordinary conversation. Ordinarily you rightly try to keep a connecting thread running through your remarks and you exclude any intrusive ideas that may occur to you and any side-issues, so as not to wander too far from the point. But in this case you must proceed differently. You will notice that as you relate things various thoughts will occur to you which you would like to put aside on the ground of certain criticisms and objections. You will be tempted to say to yourself that this or that is irrelevant here, or is quite unimportant, or nonsensical, so that there is no need to say it. You must never give in to these criticisms, but must say it in spite of them - indeed, you must say it precisely *because* you feel an aversion to doing so. Later on you will find out and learn to understand the reason for this injunction, which is really the only one you have to follow. So say whatever goes through your mind. Act as though, for instance, you were a traveller sitting next to the window of a railway carriage and describing to someone inside the carriage the changing views which you see outside. Finally, never forget that you have promised to be absolutely honest, and never leave anything out because, for some reason or other, it is unpleasant to tell it.'¹

¹ Much might be said about our experiences with the fundamental rule of psycho-analysis. One occasionally comes across people who behave as if they had made this rule for themselves. Others offend against it from the very beginning. It is indispensable, and also advantageous, to lay down the rule in the first stages of the treatment. Later, under the dominance of the resistances, obedience to it weakens, and there comes a time in every analysis when the patient disregards it. We must remember from our own self-analysis how irresistible the temptation is to yield to these pretexts put forward by critical judgement for rejecting certain ideas. How small is the effect of such agreements as one makes with the patient in laying down the fundamental rule is regularly demonstrated when something intimate about a third person comes up in his mind for the first time. He knows that he is supposed to say everything, but he turns discretion about other people into a new obstacle! 'Must I really say everything? I thought that only applied to things that concern myself.' It is naturally impossible to carry out analysis if the patient's relations with other people and his thoughts about them are excluded. *Pour faire une omelette il faut casser des oeufs*. An honourable man readily forgets such of the private affairs of strangers as do not seem to him important to know. Nor can an exception be made in the case of names. Otherwise the patient's narratives became a little shadowy, like the scenes in Goethe's play *Die natürliche Tochter* [*The Natural Daughter*], and do not lodge in the doctor's memory. Moreover, the names that are withheld screen the approach to all sorts of important connections. But one may perhaps allow names to be left on one side until the patient has become more familiar with the doctor and the procedure of analysis. It is very remarkable how the whole task becomes impossible if a reservation is allowed at any single place. But we have only to reflect what would happen if the right of asylum existed at any one point in a town; how long would it be before all the riff-raff of the town had collected there? I once treated a high official who was bound by his oath of office not to communicate certain things because they were state secrets, and the analysis came to grief as a consequence of this restriction. Psycho-analytic treatment must have no regard for any consideration, because the neurosis and its resistances are themselves without any such regard.

Patients who date their illness from a particular moment usually concentrate upon its precipitating cause. Others, who themselves recognize the connection between their neurosis and their childhood, often begin with an account of their whole life-history. A systematic narrative should never be expected and nothing should be done to encourage it. Every detail of the story will have to be told afresh later on, and it is only with these repetitions that additional material will appear which will supply the important connections that are unknown to the patient.

There are patients who from the very first hours carefully prepare what they are going to communicate, ostensibly so as to be sure of making better use of the time devoted to the treatment. What is thus disguising itself as eagerness is resistance. Any preparation of this sort should be disrecommended, for it is only employed to guard against unwelcome thoughts cropping up.¹ However genuinely the patient may believe in his excellent intentions, the resistance will play its part in this deliberate method of preparation and will see to it that the most valuable material escapes communication. One will soon find that the patient devises yet other means by which what is required may be withheld from the treatment. He may talk over the treatment every day with some intimate friend, and bring into this discussion all the thoughts which should come forward in the presence of the doctor. The treatment thus has a leak which lets through precisely what is most valuable. When this happens, the patient must, without much delay, be advised to treat his analysis as a matter between himself and his doctor and to exclude everyone else from sharing in the knowledge of it, no matter how close to him they may be, or how inquisitive. In later stages of the treatment the patient is usually not subjected to temptations of this sort.

Certain patients want their treatment to be kept secret, often because they have kept their neurosis secret; and I put no obstacle in their way. That in consequence the world hears nothing of some of the most successful cures is, of course, a consideration that cannot be taken into account. It is obvious that a patient's decision in favour of secrecy already reveals a feature of his secret history.

¹ Exceptions may be made only for such data as family relationships, times and places of residence, operations, and so on.

In advising the patient at the beginning of the treatment to tell as few people as possible about it, we also protect him to some extent from the many hostile influences that will seem to entice him away from analysis. Such influences may be very mischievous at the outset of the treatment; later, they are usually immaterial, or even useful in bringing to the fore resistances which are trying to conceal themselves.

If during the course of the analysis the patient should temporarily need some other medical or specialist treatment, it is far wiser to call in a non-analytic colleague than to give this other treatment oneself. Combined treatments for neurotic disorders which have a powerful organic basis are nearly always impracticable. The patients withdraw their interest from analysis as soon as they are shown more than one path that promises to lead them to health. The best plan is to postpone the organic treatment until the psychical treatment is finished; if the former were tried first it would in most cases meet with no success.

To return to the beginning of the treatment. Patients are occasionally met with who start the treatment by assuring us that they cannot think of anything to say, although the whole field of their life-history and the story of their illness is open to them to choose from. Their request that we should tell them what to talk about must not be granted on this first occasion any more than on any later one. We must bear in mind what is involved here. A strong resistance has come to the front in order to defend the neurosis; we must take up the challenge then and there and come to grips with it. Energetic and repeated assurances to the patient that it is impossible for no ideas at all to occur to him at the beginning, and that what is in question is a resistance against the analysis, soon oblige him to make the expected admissions or to uncover a first piece of his complexes. It is a bad sign if he has to confess that while he was listening to the fundamental rule of analysis he made a mental reservation that he would nevertheless keep this or that to himself; it is not so serious if all he has to tell us is how mistrustful he is of analysis or the horrifying things he has heard about it. If he denies these and similar possibilities when they are put before him, he can be driven by our insistence to acknowledge that he has nevertheless overlooked certain thoughts which were occupying his mind. He had thought of the treatment itself, though nothing definite about it, or he had been occupied with the picture of the room in which he was, or he could not help thinking of the objects in the consulting room and of the fact that he was lying here on a sofa - all of which he has replaced by the word 'nothing'. These indications are intelligible enough: everything connected with the present situation represents a transference to the doctor, which proves suitable to serve as a first resistance. We are thus obliged to begin by uncovering this transference; and a path from it will give rapid access to the patient's pathogenic material. Women who are prepared by events in their past history to be subjected to sexual aggression and men with over-strong repressed homosexuality are the most apt thus to withhold the ideas that occur to them at the outset of their analysis.

The patient's first symptoms or chance actions, like his first resistance, may possess a special interest and may betray a complex which governs his neurosis. A clever young philosopher with exquisite aesthetic sensibilities will hasten to put the creases of his trousers straight before lying down for his first hour; he is revealing himself as a former coprophilic of the highest refinement - which was to be expected from the later aesthete. A young girl will at the same juncture hurriedly pull the hem of her skirt over her exposed ankles; in doing this she is giving away the gist of what her analysis will uncover later: her narcissistic pride in her physical beauty and her inclinations to exhibitionism.

A particularly large number of patients object to being asked to lie down, while the doctor sits out of sight behind them. They ask to be allowed to go through the treatment in some other position, for the most part because they are anxious not to be deprived of a view of the doctor. Permission is regularly refused, but one cannot prevent them from contriving to say a few sentences before the beginning of the actual 'session' or after one has signified that it is finished and they have got up from the sofa. In this way they divide the treatment in their own view into an official portion, in which they mostly behave in a very inhibited manner, and an informal 'friendly' portion, in which they speak really freely and say all sorts of things which they themselves do not regard as being part of the treatment. The doctor does not accept this division for long. He takes note of what is said before or after the session and he brings it forward at the first opportunity, thus pulling down the partition which the patient has tried to erect. This partition, once again, will have been put together from the material of a transference-resistance.

So long as the patient's communications and ideas run on without any obstruction, the theme of transference should be left untouched. One must wait until the transference, which is the most delicate of all procedures, has become a resistance.

The next question with which we are faced raises a matter of principle. It is this: When are we to begin making our communications to the patient? When is the moment for disclosing to him the hidden meaning of the ideas that occur to him, and for initiating him into the postulates and technical procedures of analysis?

The answer to this can only be: Not until an effective transference has been established in the patient, a proper *rapport* with him. It remains the first aim of the treatment to attach him to it and to the person of the doctor. To ensure this, nothing need be done but to give him time. If one exhibits a serious interest in him, carefully clears away the resistances that crop up at the beginning and avoids making certain mistakes, he will of himself form such an attachment and link the doctor up with one of the imagos of the people by whom he was accustomed to be treated with affection. It is certainly possible to forfeit this first success if from the start one takes up any standpoint other than one of sympathetic understanding, such as a moralizing one, or if one behaves like a representative or contending party - of the other member of a married couple, for instance.

This answer of course involves a condemnation of any line of behaviour which would lead us to give the patient a translation of his symptoms as soon as we have guessed it ourselves, or would even lead us to regard it as a special triumph to fling these 'solutions' in his face at the first interview. It is not difficult for a skilled analyst to read the patient's secret wishes plainly between the lines of his complaints and the story of his illness; but what a measure of self-complacency and thoughtlessness must be possessed by anyone who can, on the shortest acquaintance, inform a stranger who is entirely ignorant of all the tenets of analysis that he is attached to his mother by incestuous ties, that he harbours wishes for the death of his wife whom he appears to love, that he conceals an intention of betraying his superior, and so on! I have heard that there are analysts who plume themselves upon these kinds of lightning diagnoses and 'express' treatments, but I must warn everyone against following such examples. Behaviour of this sort will completely discredit oneself and the treatment in the patient's eyes and will arouse the most violent opposition in him, whether one's guess has been true or not; indeed, the truer the guess the more violent will be the resistance. As a rule the therapeutic effect will be nil; but the deterring of the patient from analysis will be final. Even in the later stages of analysis one must be careful not to give a patient the solution of a symptom or the translation of a wish until he is already so close to it that he has only one short step more to make in order to get hold of the explanation for himself. In former years I often had occasion to find that the premature communication of a solution brought the treatment to an untimely end, on account not only of the resistances which it thus suddenly awakened but also of the relief which the solution brought with it.

But at this point an objection will be raised. Is it, then, our task to lengthen the treatment and not, rather, to bring it to an end as rapidly as possible? Are not the patient's ailments due to his lack of knowledge and understanding and is it not a duty to enlighten him as soon as possible - that is, as soon as the doctor himself knows the explanations? The answer to this question calls for a short digression on the meaning of knowledge and the mechanism of cure in analysis.

It is true that in the earliest days of analytic technique we took an intellectualist view of the situation. We set a high value on the patient's knowledge of what he had forgotten, and in this we made hardly any distinction between our knowledge of it and his. We thought it a special piece of good luck if we were able to obtain information about the forgotten childhood trauma from other sources - for instance, from parents or nurses or the seducer himself - as in some cases it was possible to do; and we hastened to convey the information and the proofs of its correctness to the patient, in the certain expectation of thus bringing the neurosis and the treatment to a rapid end. It was a severe disappointment when the expected success was not forthcoming. How could it be that the patient, who now knew about his traumatic experience, nevertheless still behaved as if he knew no more about it than before? Indeed, telling and describing his repressed trauma to him did not even result in any recollection of it coming into his mind.

In one particular case the mother of a hysterical girl had confided to me the homosexual experience which had greatly contributed to the fixation of the girl's attacks. The mother had herself surprised the scene; but the patient had completely forgotten it, though it had occurred when she was already approaching puberty. I was now able to make a most instructive observation. Every time I repeated her mother's story to the girl she reacted with a hysterical attack, and after this she forgot the story once more. There is no doubt that the patient was expressing a violent resistance against the knowledge that was being forced upon her. Finally she simulated feeble-mindedness and a complete loss of memory in order to protect herself against what I had told her. After this, there was no choice but to cease attributing to the fact of knowing, in itself, the importance that had previously been given to it and to place the emphasis on the resistances which had in the past brought about the state of not knowing and which were still ready to defend that state. Conscious knowledge, even if it was not subsequently driven out again, was powerless against those resistances.

The strange behaviour of patients, in being able to combine a conscious knowing with not knowing, remains inexplicable by what is called normal psychology. But to psycho-analysis, which recognizes the existence of the unconscious, it presents no difficulty. The phenomenon we have described, moreover, provides some of the best support for a view which approaches mental processes from the angle of topographical differentiation. The patients now know of the repressed experience in their conscious thought, but this thought lacks any connection with the place where the repressed recollection is in some way or other contained. No change is possible until the conscious thought-process has penetrated to that place and has overcome the resistances of repression there. It is just as though a decree were promulgated by the Ministry of Justice to the effect that juvenile delinquencies should be dealt with in a certain lenient manner. As long as this decree has not come to the knowledge of the local magistrates, or in the event of their not intending to obey it but preferring to administer justice by their own lights, no change can occur in the treatment of particular youthful delinquents. For the sake of complete accuracy, however, it should be added that the communication of repressed material to the patient's consciousness is nevertheless not without effect. It does not produce the hoped-for result of putting an end to the symptoms; but it has other consequences. At first it arouses resistances, but then, when these have been overcome, it sets up a process of thought in the course of which the expected influencing of the unconscious recollection eventually takes place.

It is now time for us to take a survey of the play of forces which is set in motion by the treatment. The primary motive force in the therapy is the patient's suffering and the wish to be cured that arises from it. The strength of this motive force is subtracted from by various factors - which are not discovered till the analysis is in progress - above all, by what we have called the 'secondary gain from illness'; but it must be maintained till the end of the treatment. Every improvement effects a diminution of it. By itself, however, this motive force is not sufficient to get rid of the illness. Two things are lacking in it for this: it does not know what paths to follow to reach this end; and it does not possess the necessary quota of energy with which to oppose the resistances. The analytic treatment helps to remedy both these deficiencies. It supplies the amounts of energy that are needed for overcoming the resistances by making mobile the energies which lie ready for the transference; and, by giving the patient information at the right time, it shows him the paths along which he should direct those energies. Often enough the transference is able to remove the symptoms of the disease by itself, but only for a while - only for as long as it itself lasts. In this case the treatment is a treatment by suggestion, and not a psycho-analysis at all. It only deserves the latter name if the intensity of the transference has been utilized for the overcoming of resistances. Only then has being ill become impossible, even when the transference has once more been dissolved, which is its destined end.

In the course of the treatment yet another helpful factor is aroused. This is the patient's intellectual interest and understanding. But this alone hardly comes into consideration in comparison with the other forces that are engaged in the struggle; for it is always in danger of losing its value, as a result of the clouding of judgement that arises from the resistances. Thus the new sources of strength for which the patient is indebted to his analyst are reducible to transference and instruction (through the communications made to him). The patient, however, only makes use of the instruction in so far as he is induced to do so by the transference; and it is for this reason that our first communication should be withheld until a strong transference has been established. And this, we may add, holds good of every subsequent communication. In each case we must wait until the disturbance of the transference by the successive emergence of transference-resistances has been removed.

REMEMBERING, REPEATING AND WORKING-THROUGH
(FURTHER RECOMMENDATIONS ON THE TECHNIQUE OF PSYCHO-ANALYSIS II)
(1914)

Intentionally left blank

REMEMBERING, REPEATING AND WORKING-THROUGH (FURTHER RECOMMENDATIONS ON THE TECHNIQUE OF PSYCHO-ANALYSIS II)

It seems to me not unnecessary to keep on reminding students of the far-reaching changes which psycho-analytic technique has undergone since its first beginnings. In its first phase - that of Breuer's catharsis - it consisted in bringing directly into focus the moment at which the symptom was formed, and in persistently endeavouring to reproduce the mental processes involved in that situation, in order to direct their discharge along the path of conscious activity. Remembering and abreacting, with the help of the hypnotic state, were what was at that time aimed at. Next, where hypnosis had been given up, the task became one of discovering from the patient's free associations what he failed to remember. The resistance was to be circumvented by the work of interpretation and by making its results known to the patient. The situations which had given rise to the formation of the symptom and the other situations which lay behind the moment at which the illness broke out retained their place as the focus of interest; but the element of abreaction receded into the background and seemed to be replaced by the expenditure of work which the patient had to make in being obliged to overcome his criticism of his free associations, in accordance with the fundamental rule of psycho-analysis. Finally, there was evolved the consistent technique used to-day, in which the analyst gives up the attempt to bring a particular moment or problem into focus. He contents himself with studying whatever is present for the time being on the surface of the patient's mind, and he employs the art of interpretation mainly for the purpose of recognizing the resistances which appear there, and making them conscious to the patient. From this there results a new sort of division of labour: the doctor uncovers the resistances which are unknown to the patient; when these have been got the better of, the patient often relates the forgotten situations and connections without any difficulty. The aim of these different techniques has, of course, remained the same. Descriptively speaking, it is to fill in gaps in memory; dynamically speaking, it is to overcome resistances due to repression.

We must still be grateful to the old hypnotic technique for having brought before us single psychical processes of analysis in an isolated or schematic form. Only this could have given us the courage ourselves to create more complicated situations in the analytic treatment and to keep them clear before us.

In these hypnotic treatments the process of remembering took a very simple form. The patient put himself back into an earlier situation, which he seemed never to confuse with the present one, and gave an account of the mental processes belonging to it, in so far as they had remained normal; he then added to this whatever was able to emerge as a result of transforming the processes that had at the time been unconscious into conscious ones.

At this point I will interpolate a few remarks which every analyst has found confirmed in his observations. Forgetting impressions, scenes or experiences nearly always reduces itself to shutting them off. When the patient talks about these 'forgotten' things he seldom fails to add: 'As a matter of fact I've always known it; only I've never thought of it.' He often expresses disappointment at the fact that not enough things come into his head that he can call 'forgotten' - that he has never thought of since they happened. Nevertheless, even this desire is fulfilled, especially in the case of conversion hysterics. 'Forgetting' becomes still further restricted when we assess at their true value the screen memories which are so generally present. In some cases I have had an impression that the familiar childhood amnesia, which is theoretically so important to us, is completely counterbalanced by screen memories. Not only *some* but *all* of what is essential from childhood has been retained in these memories. It is simply a question of knowing how to extract it out of them by analysis. They represent the forgotten years of childhood as adequately as the manifest content of a dream represents the dream-thoughts.

The other group of psychical processes - phantasies, processes of reference, emotional impulses, thought-connections - which, as purely internal acts, can be contrasted with impressions and experiences, must, in their relation to forgetting and remembering, be considered separately. In these processes it particularly often happens that something is 'remembered' which could never have been 'forgotten' because it was never at any time noticed - was never conscious. As regards the course taken by psychical events it seems to make no difference whatever whether such a 'thought-connection' was conscious and then forgotten or whether it never managed to become conscious at all. The conviction which the patient obtains in the course of his analysis is quite independent of this kind of memory.

In the many different forms of obsessional neurosis in particular, forgetting is mostly restricted to dissolving thought-connections, failing to draw the right conclusions and isolating memories.

There is one special class of experiences of the utmost importance for which no memory can as a rule be recovered. These are experiences which occurred in very early childhood and were not understood at the time but which were *subsequently* understood and interpreted. One gains a knowledge of them through dreams and one is obliged to believe in them on the most compelling evidence provided by the fabric of the neurosis. Moreover, we can ascertain for ourselves that the patient, after his resistances have been overcome, no longer invokes the absence of any memory of them (any sense of familiarity with them) as a ground for refusing to accept them. This matter, however, calls for so much critical caution and introduces so much that is novel and startling that I shall reserve it for a separate discussion in connection with suitable material.

Under the new technique very little, and often nothing, is left of this delightfully smooth course of events. There are some cases which behave like those under the hypnotic technique up to a point and only later cease to do so; but others behave differently from the beginning. If we confine ourselves to this second type in order to bring out the difference, we may say that the patient does not *remember* anything of what he has forgotten and repressed, but *acts* it out. He reproduces it not as a memory but as an action; he *repeats* it, without, of course, knowing that he is repeating it.

For instance, the patient does not say that he remembers that he used to be defiant and critical towards his parents' authority; instead, he behaves in that way to the doctor. He does not remember how he came to a helpless and hopeless deadlock in his infantile sexual researches; but he produces a mass of confused dreams and associations, complains that he cannot succeed in anything and asserts that he is fated never to carry through what he undertakes. He does not remember having been intensely ashamed of certain sexual activities and afraid of their being found out; but he makes it clear that he is ashamed of the treatment on which he is now embarked and tries to keep it secret from everybody. And so on.

Above all, the patient will *begin* his treatment with a repetition of this kind. When one has announced the fundamental rule of psycho-analysis to a patient with an eventful life-history and a long story of illness and has then asked him to say what occurs to his mind, one expects him to pour out a flood of information; but often the first thing that happens is that he has nothing to say. He is silent and declares that nothing occurs to him. This, of course, is merely a repetition of a homosexual attitude which comes to the fore as a resistance against remembering anything. As long as the patient is in the treatment he cannot escape from this compulsion to repeat; and in the end we understand that this is his way of remembering.

What interests us most of all is naturally the relation of this compulsion to repeat to the transference and to resistance. We soon perceive that the transference is itself only a piece of repetition, and that the repetition is a transference of the forgotten past not only on to the doctor but also on to all the other aspects of the current situation. We must be prepared to find, therefore, that the patient yields to the compulsion to repeat, which now replaces the impulsion to remember, not only in his personal attitude to his doctor but also in every other activity and relationship which may occupy his life at the time - if, for instance, he falls in love or undertakes a task or starts an enterprise during the treatment. The part played by resistance, too, is easily recognized. The greater the resistance, the more extensively will acting out (repetition) replace remembering. For the ideal remembering of what has been forgotten which occurs in hypnosis corresponds to a state in which resistance has been put completely on one side. If the patient starts his treatment under the auspices of a mild and unpronounced positive transference it makes it possible at first for him to unearth his memories just as he would under hypnosis, and during this time his pathological symptoms themselves are quiescent. But if, as the analysis proceeds, the transference becomes hostile or unduly intense and therefore in need of repression, remembering at once gives way to acting out. From then onwards the resistances determine the sequence of the material which is to be repeated. The patient brings out of the armoury of the past the weapons with which he defends himself against the progress of the treatment - weapons which we must wrest from him one by one.

We have learnt that the patient repeats instead of remembering, and repeats under the conditions of resistance. We may now ask what it is that he in fact repeats or acts out. The answer is that he repeats everything that has already made its way from the sources of the repressed into his manifest personality - his inhibitions and unserviceable attitudes and his pathological character-traits. He also repeats all his symptoms in the course of the treatment. And now we can see that in drawing attention to the compulsion to repeat we have acquired no new fact but only a more comprehensive view. We have only made it clear to ourselves that the patient's state of being ill cannot cease with the beginning of his analysis, and that we must treat his illness, not as an event of the past, but as a present-day force. This state of illness is brought, piece by piece, within the field and range of operation of the treatment, and while the patient experiences it as something real and contemporary, we have to do our therapeutic work on it, which consists in a large measure in tracing it back to the past.

Remembering, as it was induced in hypnosis, could not but give the impression of an experiment carried out in the laboratory. Repeating, as it is induced in analytic treatment according to the newer technique, on the other hand, implies conjuring up a piece of real life; and for that reason it cannot always be harmless and unobjectionable. This consideration opens up the whole problem of what is so often unavoidable - 'deterioration during treatment'.

First and foremost, the initiation of the treatment in itself brings about a change in the patient's conscious attitude to his illness. He has usually been content with lamenting it, despising it as nonsensical and underestimating its importance; for the rest, he has extended to its manifestations the ostrich-like policy of repression which he adopted towards its origins. Thus it can happen that he does not properly know under what conditions his phobia breaks out or does not listen to the precise wording of his obsessional ideas or does not grasp the actual purpose of his obsessional impulse. The treatment, of course, is not helped by this. He must find the courage to direct his attention to the phenomena of his illness. His illness itself must no longer seem to him contemptible, but must become an enemy worthy of his mettle, a piece of his personality, which has solid ground for its existence and out of which things of value for his future life have to be derived. The way is thus paved from the beginning for a reconciliation with the repressed material which is coming to expression in his symptoms, while at the same time place is found for a certain tolerance for the state of being ill. If this new attitude towards the illness intensifies the conflicts and brings to the fore symptoms which till then had been indistinct, one can easily console the patient by pointing out that these are only necessary and temporary aggravations and that one cannot overcome an enemy who is absent or not within range. The resistance, however, may exploit the situation for its own ends and abuse the licence to be ill. It seems to say: 'See what happens if I really give way to such things. Was I not right to consign them to repression?' Young and childish people in particular are inclined to make the necessity imposed by the treatment for paying attention to their illness a welcome excuse for luxuriating in their symptoms.

Further dangers arise from the fact that in the course of the treatment new and deeper-lying instinctual impulses, which have not hitherto made themselves felt, may come to be 'repeated'. Finally, it is possible that the patient's actions outside the transference may do him temporary harm in his ordinary life, or even have been so chosen as permanently to invalidate his prospects of recovery.

The tactics to be adopted by the physician in this situation are easily justified. For him, remembering in the old manner - reproduction in the psychical field - is the aim to which he adheres, even though he knows that such an aim cannot be achieved in the new technique. He is prepared for a perpetual struggle with his patient to keep in the psychical sphere all the impulses which the patient would like to direct into the motor sphere; and he celebrates it as a triumph for the treatment if he can bring it about that something that the patient wishes to discharge in action is disposed of through the work of remembering. If the attachment through transference has grown into something at all serviceable, the treatment is able to prevent the patient from executing any of the more important repetitive actions and to utilize his intention to do so *in statu nascendi* as material for the therapeutic work. One best protects the patient from injuries brought about through carrying out one of his impulses by making him promise not to take any important decisions affecting his life during the time of his treatment - for instance, not to choose any profession or definitive love-object - but to postpone all such plans until after his recovery.

At the same time one willingly leaves untouched as much of the patient's personal freedom as is compatible with these restrictions, nor does one hinder him from carrying out unimportant intentions, even if they are foolish; one does not forget that it is in fact only through his own experience and mishaps that a person learns sense. There are also people whom one cannot restrain from plunging into some quite undesirable project during the treatment and who only afterwards become ready for, and accessible to, analysis. Occasionally, too, it is bound to happen that the untamed instincts assert themselves before there is time to put the reins of the transference on them, or that the bonds which attach the patient to the treatment are broken by him in a repetitive action. As an extreme example of this, I may cite the case of an elderly lady who had repeatedly fled from her house and her husband in a twilight state and gone no one knew where, without ever having become conscious of her motive for decamping in this way. She came to treatment with a marked affectionate transference which grew in intensity with uncanny rapidity in the first few days; by the end of the week she had decamped from me, too, before I had had time to say anything to her which might have prevented this repetition.

The main instrument, however, for curbing the patient's compulsion to repeat and for turning it into a motive for remembering lies in the handling of the transference. We render the compulsion harmless, and indeed useful, by giving it the right to assert itself in a definite field. We admit it into the transference as a playground in which it is allowed to expand in almost complete freedom and in which it is expected to display to us everything in the way of pathogenic instincts that is hidden in the patient's mind. Provided only that the patient shows compliance enough to respect the necessary conditions of the analysis, we regularly succeed in giving all the symptoms of the illness a new transference meaning and in replacing his ordinary neurosis by a 'transference-neurosis' of which he can be cured by the therapeutic work. The transference thus creates an intermediate region between illness and real life through which the transition from the one to the other is made. The new condition has taken over all the features of the illness; but it represents an artificial illness which is at every point accessible to our intervention. It is a piece of real experience, but one which has been made possible by especially favourable conditions, and it is of a provisional nature. From the repetitive reactions which are exhibited in the transference we are led along the familiar paths to the awakening of the memories, which appear without difficulty, as it were, after the resistance has been overcome.

I might break off at this point but for the title of this paper, which obliges me to discuss a further point in analytic technique. The first step in overcoming the resistances is made, as we know, by the analyst's uncovering the resistance, which is never recognized by the patient, and acquainting him with it. Now it seems that beginners in analytic practice are inclined to look on this introductory step as constituting the whole of their work. I have often been asked to advise upon cases in which the doctor complained that he had pointed out his resistance to the patient and that nevertheless no change had set in; indeed, the resistance had become all the stronger, and the whole situation was more obscure than ever. The treatment seemed to make no headway. This gloomy foreboding always proved mistaken. The treatment was as a rule progressing most satisfactorily. The analyst had merely forgotten that giving the resistance a name could not result in its immediate cessation. One must allow the patient time to become more conversant with this resistance with which he has now become acquainted, to *work through* it, to overcome it, by continuing, in defiance of it, the analytic work according to the fundamental rule of analysis. Only where the resistance is at its height can the analyst, working in common with his patient, discover the repressed instinctual impulses which are feeding the resistance; and it is this kind of experience which convinces the patient of the existence and power of such impulses. The doctor has nothing else to do than to wait and let things take their course, a course which cannot be avoided nor always hastened. If he holds fast to this conviction he will often be spared the illusion of having failed when in fact he is conducting the treatment on the right lines.

This working-through of the resistances may in practice turn out to be an arduous task for the subject of the analysis and a trial of patience for the analyst. Nevertheless it is a part of the work which effects the greatest changes in the patient and which distinguishes analytic treatment from any kind of treatment by suggestion. From a theoretical point of view one may correlate it with the 'abreacting' of the quotas of affect strangled by repression - an abreaction without which hypnotic treatment remained ineffective.

OBSERVATIONS ON TRANSFERENCE-LOVE
(FURTHER RECOMMENDATIONS ON THE TECHNIQUE OF PSYCHO-ANALYSIS III)
(1915)

OBSERVATIONS ON TRANSFERENCE-LOVE (FURTHER RECOMMENDATIONS ON THE TECHNIQUE OF PSYCHO-ANALYSIS III)

Every beginner in psycho-analysis probably feels alarmed at first at the difficulties in store for him when he comes to interpret the patient's associations and to deal with the reproduction of the repressed. When the time comes, however, he soon learns to look upon these difficulties as insignificant, and instead becomes convinced that the only really serious difficulties he has to meet lie in the management of the transference.

Among the situations which arise in this connection I shall select one which is very sharply circumscribed; and I shall select it, partly because it occurs so often and is so important in its real aspects and partly because of its theoretical interest. What I have in mind is the case in which a woman patient shows by unmistakable indications, or openly declares, that she has fallen in love, as any other mortal woman might, with the doctor who is analysing her. This situation has its distressing and comical aspects, as well as its serious ones. It is also determined by so many and such complicated factors, it is so unavoidable and so difficult to clear up, that a discussion of it to meet a vital need of analytic technique has long been overdue. But since we who laugh at other people's failings are not always free from them ourselves, we have not so far been precisely in a hurry to fulfil this task. We are constantly coming up against the obligation to professional discretion - a discretion which cannot be dispensed with in real life, but which is of no service in our science. In so far as psycho-analytic publications are a part of real life, too, we have here an insoluble contradiction. I have recently disregarded this matter of discretion at one point,¹ and shown how this same transference situation held back the development of psycho-analytic therapy during its first decade.

¹ In the first section of my contribution to the history of the psycho-analytic movement (1914d)

To a well-educated layman (for that is what the ideal civilized person is in regard to psycho-analysis) things that have to do with love are incommensurable with everything else; they are, as it were, written on a special page on which no other writing is tolerated. If a woman patient has fallen in love with her doctor it seems to such a layman that only two outcomes are possible. One, which happens comparatively rarely, is that all the circumstances allow of a permanent legal union between them; the other, which is more frequent, is that the doctor and the patient part and give up the work they have begun which was to have led to her recovery, as though it had been interrupted by some elemental phenomenon. There is, to be sure, a third conceivable outcome, which even seems compatible with a continuation of the treatment. This is that they should enter into a love-relationship which is illicit and which is not intended to last for ever. But such a course is made impossible by conventional morality and professional standards. Nevertheless, our layman will beg the analyst to reassure him as unambiguously as possible that this third alternative is excluded.

It is clear that a psycho-analyst must look at things from a different point of view.

Let us take the case of the second outcome of the situation we are considering. After the patient has fallen in love with her doctor, they part; the treatment is given up. But soon the patient's condition necessitates her making a second attempt at analysis, with another doctor. The next thing that happens is that she feels she has fallen in love with this second doctor too; and if she breaks off with him and begins yet again, the same thing will happen with the third doctor, and so on. This phenomenon, which occurs without fail and which is, as we know, one of the foundations of the psycho-analytic theory, may be evaluated from two points of view, that of the doctor who is carrying out the analysis and that of the patient who is in need of it.

For the doctor the phenomenon signifies a valuable piece of enlightenment and a useful warning against any tendency to a counter-transference which may be present in his own mind. He must recognize that the patient's falling in love is induced by the analytic situation and is not to be attributed to the charms of his own person; so that he has no grounds whatever for being proud of such a 'conquest', as it would be called outside analysis. And it is always well to be reminded of this. For the patient, however, there are two alternatives: either she must relinquish psycho-analytic treatment or she must accept falling in love with her doctor as an inescapable fate.¹

¹ We know that the transference can manifest itself in other, less tender feelings, but I do not propose to go into that side of the matter here.

I have no doubt that the patient's relatives and friends will decide as emphatically for the first of these two alternatives as the analyst will for the second. But I think that here is a case in which the decision cannot be left to the tender - or rather, the egoistic and jealous - concern of her relatives. The welfare of the patient alone should be the touchstone; her relatives' love cannot cure her neurosis. The analyst need not push himself forward, but he may insist that he is indispensable for the achievement of certain ends. Any relative who adopts Tolstoy's attitude to this problem can remain in undisturbed possession of his wife or daughter; but he will have to try to put up with the fact that she, for her part, retains her neurosis and the interference with her capacity for love which it involves. The situation, after all, is similar to that in a gynaecological treatment. Moreover, the jealous father or husband is greatly mistaken if he thinks that the patient will escape falling in love with her doctor if he hands her over to some kind of treatment other than analysis for combating her neurosis. The difference, on the contrary, will only be that a love of this kind, which is bound to remain unexpressed and unanalysed, can never make the contribution to the patient's recovery which analysis would have extracted from it.

It has come to my knowledge that some doctors who practise analysis frequently prepare their patients for the emergence of the erotic transference or even urge them to 'go ahead and fall in love with the doctor so that the treatment may make progress'. I can hardly imagine a more senseless proceeding. In doing so, an analyst robs the phenomenon of the element of spontaneity which is so convincing and lays up obstacles for himself in the future which are hard to overcome.

At a first glance it certainly does not look as if the patient's falling in love in the transference could result in any advantage to the treatment. No matter how amenable she has been up till then, she suddenly loses all understanding of the treatment and all interest in it, and will not speak or hear about anything but her love, which she demands to have returned. She gives up her symptoms or pays no attention to them; indeed, she declares that she is well. There is a complete change of scene; it is as though some piece of make-believe had been stopped by the sudden irruption of reality - as when, for instance, a cry of fire is raised during a theatrical performance. No doctor who experiences this for the first time will find it easy to retain his grasp on the analytic situation and to keep clear of the illusion that the treatment is really at an end.

A little reflection enables one to find one's bearings. First and foremost, one keeps in mind the suspicion that anything that interferes with the continuation of the treatment may be an expression of resistance. There can be no doubt that the outbreak of a passionate demand for love is largely the work of resistance. One will have long since noticed in the patient the signs of an affectionate transference, and one will have been able to feel certain that her docility, her acceptance of the analytic explanations, her remarkable comprehension and the high degree of intelligence she showed were to be attributed to this attitude towards her doctor. Now all this is swept away. She has become quite without insight and seems to be swallowed up in her love. Moreover, this change quite regularly occurs precisely at a point of time when one is having to try to bring her to admit or remember some particularly distressing and heavily repressed piece of her life-history. She has been in love, therefore, for a long time; but now the resistance is beginning to make use of her love in order to hinder the continuation of the treatment, to deflect all her interest from the work and to put the analyst in an awkward position.

If one looks into the situation more closely one recognizes the influence of motives which further complicate things - of which some are connected with being in love and others are particular expressions of resistance. Of the first kind are the patient's endeavour to assure herself of her irresistibility, to destroy the doctor's authority by bringing him down to the level of a lover and to gain all the other promised advantages incidental to the satisfaction of love. As regards the resistance, we may suspect that on occasion it makes use of a declaration of love on the patient's part as a means of putting her analyst's severity to the test, so that, if he should show signs of compliance, he may expect to be taken to task for it. But above all one gets an impression that the resistance is acting as an *agent provocateur*, it heightens the patient's state of being in love and exaggerates her readiness for sexual surrender in order to justify the workings of repression all the more emphatically, by pointing to the dangers of such licentiousness. All these accessory motives, which in simpler cases may not be present, have, as we know, been regarded by Adler as the essential part of the whole process.

But how is the analyst to behave in order not to come to grief over this situation, supposing he is convinced that the treatment should be carried on in spite of this erotic transference and should take it in its stride?

It would be easy for me to lay stress on the universally accepted standards of morality and to insist that the analyst must never under any circumstances accept or return the tender feelings that are offered him: that, instead, he must consider that the time has come for him to put before the woman who is in love with him the demands of social morality and the necessity for renunciation, and to succeed in making her give up her desires, and, having surmounted the animal side of herself, go on with the work of analysis.

I shall not, however, fulfil these expectations - neither the first nor the second of them. Not the first, because I am writing not for patients but for doctors who have serious difficulties to contend with, and also because in this instance I am able to trace the moral prescription back to its source, namely to expediency. I am on this occasion in the happy position of being able to replace the moral embargo by considerations of analytic technique, without any alteration in the outcome.

Even more decidedly, however, do I decline to fulfil the second of the expectations I have mentioned. To urge the patient to suppress, renounce or sublimate her instincts the moment she has admitted her erotic transference would be, not an analytic way of dealing with them, but a senseless one. It would be just as though, after summoning up a spirit from the underworld by cunning spells, one were to send him down again without having asked him a single question. One would have brought the repressed into consciousness, only to repress it once more in a fright. Nor should we deceive ourselves about the success of any such proceeding. As we know, the passions are little affected by sublime speeches. The patient will feel only the humiliation, and she will not fail to take her revenge for it.

Just as little can I advocate a middle course, which would recommend itself to some people as being specially ingenious. This would consist in declaring that one returns the patient's fond feelings but at the same time in avoiding any physical implementation of this fondness until one is able to guide the relationship into calmer channels and raise it to a highest level. My objection to this expedient is that psycho-analytic treatment is founded on truthfulness. In this fact lies a great part of its educative effect and its ethical value. It is dangerous to depart from this foundation. Anyone who has become saturated in the analytic technique will no longer be able to make use of the lies and pretences which a doctor normally finds unavoidable; and if, with the best intentions, he does attempt to do so, he is very likely to betray himself. Since we demand strict truthfulness from our patients, we jeopardize our whole authority if we let ourselves be caught out by them in a departure from the truth. Besides, the experiment of letting oneself go a little way in tender feelings for the patient is not altogether without danger. Our control over ourselves is not so complete that we may not suddenly one day go further than we had intended. In my opinion, therefore, we ought not to give up the neutrality towards the patient, which we have acquired through keeping the counter-transference in check.

I have already let it be understood that analytic technique requires of the physician that he should deny to the patient who is craving for love the satisfaction she demands. The treatment must be carried out in abstinence. By this I do not mean physical abstinence alone, nor yet the deprivation of everything that the patient desires, for perhaps no sick person could tolerate this. Instead, I shall state it as a fundamental principle that the patient's need and longing should be allowed to persist in her, in order that they may serve as forces impelling her to do work and to make changes, and that we must beware of appeasing those forces by means of surrogates. And what we could offer would never be anything else than a surrogate, for the patient's condition is such that, until her repressions are removed, she is incapable of getting real satisfaction.

Let us admit that this fundamental principle of the treatment being carried out in abstinence extends far beyond the single case we are considering here, and that it needs to be thoroughly discussed in order that we may define the limits of its possible application. We will not enter into this now, however, but will keep as close as possible to the situation from which we started out. What would happen if the doctor were to behave differently and, supposing both parties were free, if he were to avail himself of that freedom in order to return the patient's love and to still her need for affection?

If he has been guided by the calculation that this compliance on his part will ensure his domination over his patient and thus enable him to influence her to perform the tasks required by the treatment, and in this way to liberate herself permanently from her neurosis - then experience would inevitably show him that his calculation was wrong. The patient would achieve *her* aim, but he would never achieve *his*. What would happen to the doctor and the patient would only be what happened, according to the amusing anecdote, to the pastor and the insurance agent. The insurance agent, a free-thinker, lay at the point of death and his relatives insisted on bringing in a man of God to convert him before he died. The interview lasted so long that those who were waiting outside began to have hopes. At last the door of the sick-chamber opened. The free-thinker had not been converted; but the pastor went away insured.

If the patient's advances were returned it would be a great triumph for her, but a complete defeat for the treatment. She would have succeeded in what all patients strive for in analysis - she would have succeeded in acting out, in repeating in real life, what she ought only to have remembered, to have reproduced as psychical material and to have kept within the sphere of psychical events.¹ In the further course of the love-relationship she would bring out all the inhibitions and pathological reactions of her erotic life, without there being any possibility of correcting them; and the distressing episode would end in remorse and a great strengthening of her propensity to repression. The love-relationship in fact destroys the patient's susceptibility to influence from analytic treatment. A combination of the two would be an impossibility.

It is, therefore, just as disastrous for the analysis if the patient's craving for love is gratified as if it is suppressed. The course the analyst must pursue is neither of these; it is one for which there is no model in real life. He must take care not to steer away from the transference-love, or to repulse it or to make it distasteful to the patient; but he must just as resolutely withhold any response to it. He must keep firm hold of the transference-love, but treat it as something unreal, as a situation which has to be gone through in the treatment and traced back to its unconscious origins and which must assist in bringing all that is most deeply hidden in the patient's erotic life into her consciousness and therefore under her control. The more plainly the analyst lets it be seen that he is proof against every temptation, the more readily will he be able to extract from the situation its analytic content. The patient, whose sexual repression is of course not yet removed but merely pushed into the background, will then feel safe enough to allow all her preconditions for loving, all the phantasies springing from her sexual desires, all the detailed characteristics of her state of being in love, to come to light; and from these she will herself open the way to the infantile roots of her love.

There is, it is true, one class of women with whom this attempt to preserve the erotic transference for the purposes of analytic work without satisfying it will not succeed. These are women of elemental passionateness who tolerate no surrogates. They are children of nature who refuse to accept the psychical in place of the material, who, in the poet's words, are accessible only to 'the logic of soup, with dumplings for arguments'. With such people one has the choice between returning their love or else bringing down upon oneself the full enmity of a woman scorned. In neither case can one safeguard the interests of the treatment. One has to withdraw, unsuccessful; and all one can do is to turn the problem over in one's mind of how it is that a capacity for neurosis is joined with such an intractable need for love.

¹ See the preceding paper.

Many analysts will no doubt be agreed on the method by which other women, who are less violent in their love, can be gradually made to adopt the analytic attitude. What we do, above all, is to stress to the patient the unmistakable element of resistance in this 'love'. Genuine love, we say, would make her docile and intensify her readiness to solve the problems of her case, simply because the man she was in love with expected it of her. In such a case she would gladly choose the road to completion of the treatment, in order to acquire value in the doctor's eyes and to prepare herself for real life, where this feeling of love could find a proper place. Instead of this, we point out, she is showing a stubborn and rebellious spirit, she has thrown up all interest in her treatment, and clearly feels no respect for the doctor's well-founded convictions. She is thus bringing out a resistance under the guise of being in love with him; and in addition to this she has no compunction in placing him in a cleft stick. For if he refuses her love, as his duty and his understanding compel him to do, she can play the part of a woman scorned, and then withdraw from his therapeutic efforts out of revenge and resentment, exactly as she is now doing out of her ostensible love.

As a second argument against the genuineness of this love we advance the fact that it exhibits not a single new feature arising from the present situation, but is entirely composed of repetitions and copies of earlier reactions, including infantile ones. We undertake to prove this by a detailed analysis of the patient's behaviour in love.

If the necessary amount of patience is added to these arguments, it is usually possible to overcome the difficult situation and to continue the work with a love which has been moderated or transformed; the work then aims at uncovering the patient's infantile object-choice and the phantasies woven round it.

I should now like, however, to examine these arguments with a critical eye and to raise the question whether, in putting them forward to the patient, we are really telling the truth, of whether we are not resorting in our desperation to concealments and misrepresentations. In other words: can we truly say that the state of being in love which becomes manifest in analytic treatment is not a real one?

I think we have told the patient the truth, but not the whole truth regardless of the consequences. Of our two arguments the first is the stronger. The part played by resistance in transference-love is unquestionable and very considerable. Nevertheless the resistance did not, after all, *create* this love; it finds it ready to hand, makes use of it and aggravates its manifestations. Nor is the genuineness of the phenomenon disproved by the resistance. The second argument is far weaker. It is true that the love consists of new editions of old traits and that it repeats infantile reactions. But this is the essential character of every state of being in love. There is no such state which does not reproduce infantile prototypes. It is precisely from this infantile determination that it receives its compulsive character, verging as it does on the pathological. Transference-love has perhaps a degree less of freedom than the love which appears in ordinary life and is called normal; it displays its dependence on the infantile pattern more clearly and is less adaptable and capable of modification; but that is all, and not what is essential.

By what other signs can the genuineness of a love be recognized? By its efficacy, its serviceability in achieving the aim of love? In this respect transference-love seems to be second to none; one has the impression that one could obtain anything from it.

Let us sum up, therefore. We have no right to dispute that the state of being in love which makes its appearance in the course of analytic treatment has the character of a 'genuine' love. If it seems so lacking in normality, this is sufficiently explained by the fact that being in love in ordinary life, outside analysis, is also more similar to abnormal than to normal mental phenomena. Nevertheless, transference-love is characterized by certain features which ensure it a special position. In the first place, it is provoked by the analytic situation; secondly, it is greatly intensified by the resistance, which dominates the situation; and thirdly, it is lacking to a high degree in a regard for reality, is less sensible, less concerned about consequences and more blind in its valuation of the loved person than we are prepared to admit in the case of normal love. We should not forget, however, that these departures from the norm constitute precisely what is essential about being in love.

As regards the analyst's line of action, it is the first of these three features of transference-love which is the decisive factor. He has evoked this love by instituting analytic treatment in order to cure the neurosis. For him, it is an unavoidable consequence of a medical situation, like the exposure of a patient's body or the imparting of a vital secret. It is therefore plain to him that he must not derive any personal advantage from it. The patient's willingness makes no difference; it merely throws the whole responsibility on the analyst himself. Indeed, as he must know, the patient had been prepared for no other mechanism of cure. After all the difficulties have been successfully overcome, she will often confess to having had an anticipatory phantasy at the time when she entered the treatment, to the effect that if she behaved well she would be rewarded at the end by the doctor's affection.

For the doctor, ethical motives unite with the technical ones to restrain him from giving the patient his love. The aim he has to keep in view is that this woman, whose capacity for love is impaired by infantile fixations, should gain free command over a function which is of such inestimable importance to her; that she should not, however, dissipate it in the treatment, but keep it ready for the time when, after her treatment, the demands of real life make themselves felt. He must not stage the scene of a dog-race in which the prize was to be a garland of sausages but which some humorist spoilt by throwing a single sausage on to the track. The result was, of course, that the dogs threw themselves upon it and forgot all about the race and about the garland that was luring them to victory in the far distance. I do not mean to say that it is always easy for the doctor to keep within the limits prescribed by ethics and technique. Those who are still youngish and not yet bound by strong ties may in particular find it a hard task. Sexual love is undoubtedly one of the chief things in life, and the union of mental and bodily satisfaction in the enjoyment of love is one of its culminating peaks. Apart from a few queer fanatics, all the world knows this and conducts its life accordingly; science alone is too delicate to admit it. Again, when a woman sues for love, to reject and refuse is a distressing part for a man to play; and, in spite of neurosis and resistance, there is an incomparable fascination in a woman of high principles who confesses her passion. It is not a patient's crudely sensual desires which constitute the temptation. These are more likely to repel, and it will call for all the doctor's tolerance if he is to regard them as natural phenomenon. It is rather, perhaps, a woman's subtler and aim-inhibited wishes which bring with them the danger of making a man forget his technique and his medical task for the sake of a fine experience.

And yet it is quite out of the question for the analyst to give way. However highly he may prize love he must prize even more highly the opportunity for helping his patient over a decisive stage in her life. She has to learn from him to overcome the pleasure principle, to give up a satisfaction which lies to hand but is socially not acceptable, in favour of a more distant one, which is perhaps altogether uncertain, but which is both psychologically and socially unimpeachable. To achieve this overcoming, she has to be led through the primal period of her mental development and on that path she has to acquire the extra piece of mental freedom which distinguishes conscious mental activity - in the systematic sense - from unconscious.

The analytic psychotherapist thus has a threefold battle to wage - in his own mind against the forces which seek to drag him down from the analytic level; outside the analysis, against opponents who dispute the importance he attaches to the sexual instinctual forces and hinder him from making use of them in his scientific technique; and inside the analysis, against his patients, who at first behave like opponents but later on reveal the overvaluation of sexual life which dominates them, and who try to make him captive to their socially untamed passion.

The lay public, about whose attitude to psycho-analysis I spoke at the outset, will doubtless seize upon this discussion of transference-love as another opportunity for directing the attention of the world to the serious danger of this therapeutic method. The psycho-analyst knows that he is working with highly explosive forces and that he needs to proceed with as much caution and conscientiousness as a chemist. But when have chemists ever been forbidden, because of the danger, from handling explosive substances, which are indispensable, on account of their effects? It is remarkable that psycho-analysis has to win for itself afresh all the liberties which have long since been accorded to other medical activities. I am certainly not in favour of giving up the harmless methods of treatment. For many cases they are sufficient, and, when all is said, human society has no more use for the *furor sanandi*¹ than for any other fanaticism. But to believe that the psychoneuroses are to be conquered by operating with harmless little remedies is grossly to under-estimate those disorders both as to their origin and their practical importance. No; in medical practice there will always be room for the '*ferrum*' and the '*ignis*' side by side with the '*medicina*'; and in the same way we shall never be able to do without a strictly regular, undiluted psycho-analysis which is not afraid to handle the most dangerous mental impulses and to obtain mastery over them for the benefit of the patient.

DREAMS IN FOLKLORE
(FREUD AND OPPENHEIM)
(1957 [1911])

Intentionally left blank

DREAMS IN FOLKLORE

By Sigm. Freud and Prof. Ernst Oppenheim (Vienna)

'Celsi praetereunt austera poemata Ramnes.'¹
Persius, *Satirae*.

One of us (O.) in his studies of folklore has made two observations with regard to the dreams narrated there which seem to him worth communicating. Firstly, that the symbolism employed in these dreams coincides completely with that accepted by psycho-analysis, and secondly, that a number of these dreams are understood by the common people in the same way as they would be interpreted by psycho-analysis - that is, not as premonitions about a still unrevealed future, but as the fulfilment of wishes, the satisfaction of needs which arise during the state of sleep. Certain peculiarities of these, usually indecent, dreams, which are told as comic anecdotes, have encouraged the second of us (Fr.) to attempt an interpretation of them which has made them seem more serious and more deserving of attention.

I

PENIS-SYMBOLISM IN DREAMS OCCURRING IN FOLKLORE

The dream which we introduce first, although it contains no symbolic representations, sounds almost like ridicule of the prophetic and a plea in favour of the psychological interpretation of dreams.

A DREAM-INTERPRETATION²

A girl got up from her bed and told her mother that she had had a most strange dream.

'Well, what did you dream, then?' asked her mother.

'How shall I tell you? I don't know myself what it was - some sort of long and red and blunted thing.'

'Long means a road,' said her mother reflectively, 'a long road; red means joy, but I don't know what blunted can mean.'

The girl's father, who was getting dressed meanwhile, and was listening to everything that the mother and daughter were saying, muttered at this, more or less to himself: 'It sounds rather like my cock.'³

¹ ['Haughty persons in authority disdain poems that are lacking in charm.']

² 'Sudslavische Volksüberlieferungen, die sich auf den Geschlechtsverkehr beziehen [Southern Slav Folk Traditions concerning Sexual Intercourse]', collected and elucidated by F. S. Krauss, *Anthropophyteia*, 7, 450, No. 820.

³ [Addition by F. S. Krauss:] See *Anthropophyteia*, 1, 4, No. 5. Cf. further the German Jewish proverb: 'The goose dreams of maize and the betrothed girl of a prick.'

It is very much more convenient to study dream-symbolism in folklore than in actual dreams. Dreams are obliged to conceal things and only surrender their secrets to interpretation; these comic anecdotes, however, which are disguised as dreams, are intended as communications, meant to give pleasure to the person who tells them as well as to the listener, and therefore the interpretation is added quite unashamedly to the symbol. These stories delight in stripping off the veiling symbols.

In the following quatrain the penis appears as a sceptre:

Last night I dreamt
I was King of the land,
And how jolly I was
With a prick in my hand.¹

Now compare with this the following examples in which the same symbolism is employed outside a dream.

I love a little lass
The prettiest I've seen,
I'll put a sceptre in your hand
And you shall be a queen.²

'Remember, my boy', said Napoleon,
The Emperor of renown,
'So long as the prick is the sceptre
The cunt will be the crown.'³

A different variant of this symbolic exaltation of the genitals is favoured in the imagination of artists. A fine etching by Félicien Rops,⁴ bearing the title '*Tout est grand chez les rois*' ['Everything about kings is great'], shows the naked figure of a king with the features of the *Roi Soleil*, whose gigantic penis, which rises to arm level, itself wears a crown. The right hand balances a sceptre, while the left clasps a large orb, which by reason of a central cleft achieves an unmistakable resemblance to another part of the body which is the object of erotic desires.⁵ The index finger of the left hand is inserted into this groove.

¹ 'Niederösterreichische Schnadahüpfeln', collected by Dr. H. Rollett. *Anthropophyteia*, 5, 151, No. 2.

² From the Austrian Alps, *Kryptadia*, 4, 111, No. 160.

³ From Gaming in Lower Austria, *Anthropophyteia*, 3, 190, No. 85, 4.

⁴ Rops, 1905, Plate 20.

⁵ [Marginal Note by Oppenheim:] Like the orb in Rops's picture, a Roman relief in the Amphitheatre at Nîmes shows an egg transformed into a symbol of the female sexual organs by means of a similar groove. Here, too, the male counterpart is not absent. It appears as a phallus strangely furbished up as a bird which sits on four eggs of the kind described - one might say brooding them.

In the Silesian folksong that follows, the dream is only invented in order to hide a different occurrence. The penis appears here as a *worm* ('fat earthworm'), which has crawled into the girl, and at the right time crawls out again as a *little worm* (baby).¹

SONG OF THE EARTHWORMS²

Asleep on the grass one day a young lass
Susanna of passion was dreaming;
A soft smile did play round her nose as she lay
While she thought of her swain and his scheming.

Then - dream full of fear! - it swift did appear
That her lover so handsome and charming
Had become as she slept a fat earthworm which crept
Right inside. What could be more alarming?

Full of dread in her heart she awoke with a start
And swift to the village she hied her
And tearfully told all the folk young and old
That an earthworm had crawled up inside her.

Her wailing and tears came at last to the ears
Of her mother who cursed and swore roundly;
With bodings of gloom she repaired to her room
And examined the maiden most soundly.

For the earthworm she sought, but alas! could find nought -
An unfortunate thing which dismayed her.
So she hurried away without further delay
To ask the wise woman to aid her.

With cunning she laid out the cards for the maid
And said: 'We must wait a while longer.
'I have questioned the Knave, but no answer he gave;
'Perhaps the Red King will prove stronger.

"Tis the news that you fear which the Red King³ speaks clear:
'The worm really crawled in the girlie;
'But as everything bides its due times and its tides
'To catch it 'tis yet much too early.'

When Susanna had heard the lugubrious word
She went to her chamber full sadly;
Till at last there appeared the dread hour that she feared
And out crept the little worm gladly.

So be warned, every lass: do not dream on the grass,
But let poor Susanna's fate guide you,
Or - as you too may know, to your grief and your woe -
A fat earthworm will creep up inside you.⁴

The same symbolization of the penis by a *worm* is familiar from numerous obscene jokes.

¹ ['*Würmchen*' ('little worm') is a common German expression for 'baby'.]

² 'Schlesische Volkslieder [Silesian Folksongs]', transcribed by Dr. von Waldheim, *Anthropophyteia*, 7, 369.

³ ['*Röter König*' ('Red King') is an Austrian slang term for 'menstruation'.]

⁴ [Footnote by F. S. Krauss:] Cf. p. 359 and the Southern Slav version in Krauss, 'Die Zeugung in Sitte, Brauch und Glauben der Südslaven [Procreation in the Customs, Usages and Beliefs of the Southern Slavs]', *Kryptadia*, 6, 259-269 and 375 f.

The dream which now follows symbolizes the penis by a *dagger*: the woman who dreams it is pulling at a dagger in order to stab herself, when she is awakened by her husband and exhorted not to tear his member off.

A BAD DREAM

A woman dreamt that things had got to such a pitch that they had nothing to eat before the holiday and could not buy anything either. Her husband had drunk up all the money. There was only a lottery ticket left and even this they really ought to pawn. But the man was still keeping it back, for the draw was to be on the second of January. He said: 'Wife, now tomorrow is the draw, let the ticket wait a while longer. If we don't win, then we must sell the ticket or pawn it.' - 'Well, the devil take it, all you've bought is worry, and you've got about as much out of it as there is milk in a billy-goat.' So the next day arrived. See, along came the newspaper man. He stopped him, took a copy and began to look down the list. He ran his eyes over the figures, he looked through every column, his number was not among them. He did not trust his eyes, looked through once again and this time sure enough he came upon the number of his ticket. The number was the same, but the number of the series did not fit. Once again he did not trust himself and thought to himself: 'This must be a mistake. Wait a bit, I will go to the bank and make certain one way or the other.' So he went there with his head hanging. On the way he met a second newspaper man. He bought another copy of a second paper, scanned the list and found the number of his ticket straight away. The number of the series, too, was the same as the one which included his ticket. The prize of 5,000 roubles fell to his lot. He burst into the bank, rushed up and asked them to pay out on the winning ticket at once. The banker said that they could not pay out yet, only in a week or two. He began to beg and pray: 'Please be kind, give me one thousand at least, I can get the rest later!' The banker refused, but advised him to apply to the private individual who had procured the winning lottery ticket for him. What was to be done now? Just then a little Jew appeared as though he had sprung up from the ground. He smelt a bargain and made him an offer to pay over the money at once, though instead of 5,000 only 4,000. The fifth thousand would be his own share. The man was delighted at this good fortune and decided to give the Jew the thousand, just so that he could get the money on the spot. He took the money from the Jew and handed over the ticket to him. Then he went home. On the way he went into an inn, swallowed a quick glass and from there went straight home. He walked along grinning and humming a little song. His wife saw him through the window and thought: 'Now he's certainly sold the lottery ticket; you can see he's cheerful, he's probably paid a visit to the inn and got himself drunk because he was feeling miserable.' Then he came indoors, put the money on the kitchen table and went to his wife to bring her the good news that he had won and had got the money. While they were hugging and kissing one another to their heart's content because they were so happy, their little three-year-old daughter grabbed the money and threw it into the stove. Then they came along to count the money and it was no longer there. The last bundle of notes was already on fire. In a rage the man seized hold of the little girl by the legs and dashed her against the stove. She dropped dead. Disaster stared him in the face, there was no escaping Siberia now. He seized his revolver and bang! he shot himself in the chest and dropped dead. Horrified by such a disaster, the woman snatched up a dagger and was going to stab herself. She tried to pull it out of the sheath but could not manage it however she tried. Then she heard a voice as though from Heaven: 'Enough, let go! What are you doing?' She woke up and saw that she was not pulling at a dagger but at her husband's tool, and he was saying: 'Enough, let go or you'll tear it off!'

The representation of the penis as a weapon, cutting knife,¹ dagger, etc., is familiar to us from the anxiety dreams of abstinent women in particular and also lies at the root of numerous phobias in neurotic people. The complicated disguise of this present dream, however, demands that we should make an attempt to clarify our understanding of it by a psycho-analytic interpretation based on interpretations already carried out. In doing so we are not overlooking the fact that we shall be going beyond the material presented in the folk tale itself and that consequently our conclusions will lose in certainty.

Since this dream ends in an act of sexual aggression carried out by the woman as a dream-action, this suggests that we should take the state of *material* need in the content of the dream as a substitute for a state of *sexual* need. Only the most extreme libidinal compulsion can at all justify such aggressiveness on the part of a woman. Other pieces of the dream-content point in a quite definite and different direction. The blame for the state of need is ascribed to the man. (He had drunk up all the money.)² The dream goes on to get rid of the man and the child and skilfully evades the sense of guilt attached to these wishes by causing the child to be killed by the man who then commits suicide out of remorse. Since this is the content of the dream we are led to conclude from many analogous instances that here is a woman who is not satisfied by her husband and who in her phantasies is longing for another marriage. It is all one for the interpretation whether we like to regard this dissatisfaction of the dreamer's as a permanent state of want or merely as the expression of a temporary one. The lottery, which in the dream brought about a short-lived state of happiness, could perhaps be understood as a symbolic reference to marriage. This symbol has not yet been identified with certainty in psycho-analytic work, but people are in the habit of saying that marriage is a game of chance, that in marriage one either draws the winning lot or a blank.³ The numbers, which have been enormously magnified⁴ by the dream-work, could well correspond in that case to the number of repetitions of the satisfying act that are wished for. We are thus made aware that the act of pulling the man's member not only has the meaning of libidinal provocation but also the additional meaning of contemptuous criticism, as though the woman wanted to pull the member off - as the man correctly assumed - because it was no good, did not fulfil its obligations.

We should not have lingered over the interpretation of this dream and exploited it beyond its overt symbolism were it not that other dreams which likewise end in a dream-action demonstrate that the common people have recognized here a typical situation which, wherever it occurs, is susceptible to the same explanation. (Cf. below [p. 2538](#).)

¹ [Footnote by Oppenheim:] A knife is habitually carried by a burglar [*Einbrecher*], literally, 'someone who breaks in'. The kind of breaking-in intended is shown by a proverbial phrase from Solingen, reported in *Anthropophyteia*, 5, 182: 'After marriage comes a burglary [breaking-in].' Cf. the Berlin slang term '*Brecheisen*' ['jemmy', literally, 'breaking-iron'] for 'a powerful penis' (*Anthropophyteia*, 7, 3).

² [Marginal Note by Oppenheim:] Cf. further below our remarks on 'marriage portion' as a term for 'penis' and 'purse' for 'testes' and also in comparisons between virility and wealth and between the thirst for gold and libido.

³ Another dream about a lottery in this little collection confirms this suggestion.

⁴ Psycho-analytic experience shows that noughts appended to numbers in dreams can be ignored in interpretation.

II

FAECES-SYMBOLISM AND RELATED DREAM-ACTIONS

Psycho-analysis has taught us that in the very earliest period of childhood faeces is a highly prized substance, in relation to which coprophilic instincts find satisfaction. With the repression of these instincts, which is accelerated as much as possible by up-bringing, this substance falls into contempt and then serves conscious purposes as a means of expressing disdain and scorn. Certain forms of mental activity such as joking are still able to make the obstructed source of pleasure accessible for a brief moment, and thus show how much of the esteem in which human beings once held their faeces still remains preserved in the unconscious. The most important residue of this former esteem is, however, that all the interest which the child has had in faeces is transferred in the adult on to another material which he learns in life to set above almost everything else - gold.¹ How old this connection between excrement and gold is can be seen from an observation by Jeremias:² gold, according to ancient oriental mythology, is the excrement of hell.³

In dreams in folklore gold is seen in the most unambiguous way to be a symbol of faeces. If the sleeper feels a need to defaecate, he dreams of gold, of treasure. The disguise in the dream, which is designed to mislead him into satisfying his need in bed, usually makes the pile of faeces serve as a sign to mark the place where the treasure is to be found; that is to say, the dream - as though by means of endopsychic perception - states outright, even if in a reversed form, that gold is a sign or a symbol for faeces.

A simple treasure- or defaecation-dream of this kind is the following one, related in the *Facetiae* of Poggio.

¹ Cf. 'Character and Anal Erotism' (1908*b*),

² Jeremias (1904, 115 *n.*).

³ [*Marginal Note by Oppenheim:*] Similarly in Mexico.

DREAM-GOLD¹

A certain man related in company that he had dreamt he had found gold. Thereupon another man capped it with this story. (What follows is quoted verbatim.)

'My neighbour once dreamt that the Devil had led him to a field to dig for gold; but he found none. Then the Devil said: "It is there for sure, only you cannot dig it up now; but take note of the place so that you may recognize it again by yourself."

'When the man asked that the place should be made recognizable by some sign, the Devil suggested: "Just shit on it, then it will not occur to anybody that there is gold lying hidden here and you will be able to recognize the exact place." The man did so and then immediately awoke and felt that he had done a great heap in his bed.'

(We give the conclusion in summary.) As he was fleeing from the house, he put on a cap in which a cat had done its business during the same night. He had to wash his head and his hair. 'Thus his dream-gold was turned to filth.'

Tarasevsky (1909, 194, No. 232) reports a similar dream from the Ukraine in which a peasant receives some treasure from the Devil, to whom he has lit a candle, and puts a pile of faeces to mark the place.²

We need not be surprised if the Devil appears in these two dreams as a bestower of treasure and a seducer, for the Devil - himself an angel expelled from Paradise - is certainly nothing else than the personification of the repressed unconscious instinctual life.³

The motives behind these simple comic anecdotes about dreams appear to be exhausted in a cynical delight in dirt and a malicious satisfaction over the dreamer's embarrassment. But in other dreams about treasure the form taken by the dream is confused in all sorts of ways and includes various constituents the origin and significance of which we may well investigate. For we shall not regard even these dream-contents, which are intended to provide a rationalistic justification for obtaining the satisfaction, as entirely arbitrary and meaningless.

In the two next examples, the dream is not ascribed to a person sleeping alone but to one of two sleepers - two men - who share a bed. As a result of the dream, the dreamer dirties his bedfellow.

¹ Poggio (1905, No. 130).

² [Addition by Oppenheim:] Attention is there drawn to parallels in *Anthropophyteia*, 4, 342-345, Nos. 580-581.

³ 'Character and Anal Erotism' (1908b).

A LIVELY DREAM¹

Two travelling journeymen arrived weary at an inn and asked for a night's lodging. 'Yes,' said the host, 'if you are not afraid, you can have a bedroom, but it's a haunted one. If you want to stay, that's all right, and the night will cost you nothing as far as sleeping goes.' The lads asked one another: 'Are you frightened?' 'No.' Very well, so they seized another litre of wine and went to the room assigned to them.

They had hardly been lying down any time when the door opened and a white figure glided through the room. One fellow said to the other: 'Didn't you see something?' 'Yes.' 'Well, why didn't you say anything?' 'Just wait, it's going to come through the room again.' Sure enough, the figure glided in again. One of the lads jumped up swiftly, but swifter still the ghost glided out through the crack in the door. The lad, by no means slow, pulled open the door and saw the figure, a beautiful woman, already half way down the stairs. 'What are you doing there?' the lad shouted out. The figure stood still, turned round and spoke: 'Now I am released. I have long had to wander. As a reward take the treasure which lies just at the spot where you are standing.' The lad was as much frightened as delighted, and in order to mark the place he lifted up his shirt and planted a fine pile, for he thought that no one would wipe out that mark. But just as he was at his happiest, he felt someone suddenly seize hold of him. 'You dirty swine,' someone bellowed in his ear, 'you're shitting on my shirt.' At these coarse words the happy dreamer awoke from his fairy-tale good fortune to find himself; roughly hurled out of bed.

HE SHAT ON THE GRAVE

Two gentlemen arrived at a hotel, ate their evening meal and drank and at last wanted to go to bed. They asked the host if he would show them to a room. As the rooms were all occupied the host gave up his own bed to them, which they were both to sleep in, and he would soon find a place for himself to sleep somewhere else. The two men lay down in the same bed. A spirit appeared to one of them in a dream, lit a candle and led him to the churchyard. The lychgate opened and the spirit with the candle in its hand and the man behind walked up to the grave of a maiden. When they had reached the grave, the candle suddenly went out. 'What shall I do now? How shall I tell which is the maiden's grave to-morrow, when it is day?' he asked in the dream. Then an idea came to his rescue, he pulled down his drawers and shat on the grave. When he had finished shitting, his comrade, who was sleeping beside him, struck him first on one cheek and then on the other: 'What! You'd shit right in my face?'

¹ F. Wernert, 'Deutsche Bauernerzählungen gesammelt im Ober- und Unterelsass [German Peasant-Tales, Collected in Upper and Lower Alsace]', *Anthropophyteia*, 3, 72, No. 15.

In these two dreams, in place of the Devil other super, natural figures appear, namely ghosts - that is, spirits of dead people. 'the spirit in the second dream actually leads the dreamer to the churchyard, where he is to mark a particular grave by defaecating on it. A part of this situation is very easy to understand. The sleeper knows that the bed is not the proper place for satisfying his need; hence in the dream he causes himself to be led away from it and procures a person who shows his hidden urge the right way to another place where he is permitted to satisfy his need, indeed is required by the circumstances to do so. The spirit in the second dream actually makes use of a candle when leading him, as a servant would do if he was conducting a stranger to the W.C. at night when it was dark. But why are these representatives of the demand for a change of scene, which the lazy sleeper wants to avoid at all costs, such uncanny individuals as ghosts and spirits of dead people? Why does the spirit in the second dream lead the way to a churchyard as if to desecrate a grave? After all, these elements seem to have nothing to do with the urge to defaecate and the symbolization of faeces by gold. There is an indication; in them of an anxiety which could perhaps be traced back to an: effort to suppress the achievement of satisfaction in bed; but that anxiety would not explain the specific nature of the dream-content - its reference to death. We will refrain from making an interpretation at this point and will stress further, as being in need of explanation, the fact that in both these situations, where two men are sleeping together, the uncanny element of the ghostly guide is associated with a woman. The spirit in the first dream is early on revealed as a beautiful woman who feels she is now released, and the spirit in the second dream leads the way to the grave of a girl, on which the distinguishing mark is to be placed.

Let us turn for further enlightenment to some other defaecation-dreams of this kind, in which the bedfellows are no longer two men but a man and a woman, a married couple. The satisfying action accomplished in sleep as a result of the dream seems here particularly repellent, but perhaps for that very reason conceals a special meaning.

First, however, we will introduce a dream (on account of its connection in content with those that follow) which does not strictly speaking fit in with the plan we have just put forward. It is incomplete, inasmuch as the element of the dreamer's dirtying his bedfellow, his wife, is absent. On the other hand, the connection between the urge to defaecate and the fear of death is extremely plain. The peasant, who is described as married, dreams that he is struck by lightning and that his soul flies up to Heaven. Up there he begs to be allowed to return once more to the earth in order to see his wife and children, obtains permission to transform himself into a spider and to let himself down on the thread spun by himself. The thread is too short and the effort to express still more thread out of his body results in defaecation.

DREAM AND REALITY¹

A peasant lay in bed and had a dream. He saw himself in the field with his oxen, ploughing. Then suddenly down came a flash of lightning and struck him dead. Then he felt quite clearly his soul floating upwards until at last it reached Heaven. Peter stood by the entrance gates and was going to send the peasant in without more ado. But he begged to be allowed down to earth once more, so that he could at least take leave of his wife and his children. But Peter said that would not do, and once a man was in Heaven he was not allowed to return to the world. At this the peasant wept and begged pitifully, until at last Peter gave way. Now there was only one possible way for the peasant to see his family again and that was for Peter to change him into an animal and send him down. So the peasant was turned into a spider and span a long thread on which he let himself down. When he had arrived just over his homestead, at about the level of the chimneys, and could already see his children playing in the meadow, he noticed to his horror that he could not spin any further. Naturally his fear was great, for of course he wanted to get right down to the earth. So he squeezed and he squeezed to make the thread longer. He squeezed with all his might and main - there was a loud noise - and the peasant awoke. Something very human had happened to him while he slept.

Here we encounter spun thread as a new symbol for evacuated faeces, although psycho-analysis furnishes us with no counterpart to this symbolization but on the contrary attributes another symbolic meaning to thread. This contradiction will be settled later on.

¹ Dr. von Waldheim, 'Skatologische Erzählungen aus Preussisch-Schlesien [Scatologic Tales from Prussian Silesia]', *Anthropophyteia*, 6, 431, No. 9.

The next dream, richly elaborated and pungently told, might be described as a 'sociable' one; it ends with the wife's being dirtied. Its points of agreement with the previous dream are, however, quite striking. The peasant is, it is true, not dead, but he finds himself in Heaven, wants to return to the earth and experiences the same difficulty over 'spinning' a sufficiently long thread to let himself down on. However, he does not make this thread for himself as a spider out of his own body, but in a less fantastic way out of everything that he can fasten together, and as the thread is still not long enough to reach, the little angels actually advise him to shit and to lengthen the rope with the turds.

THE PEASANT'S ASSUMPTION TO HEAVEN¹

A peasant had the following dream. He had heard that wheat in Heaven was standing at a high price. So he thought he would like to take his wheat there. He loaded his cart, harnessed the horse and set out. He journeyed a long way till he saw the road to Heaven and followed it. Thus he came to the gates of Heaven, and look! they stood open. He charged straight forward so as to drive right inside, but he had scarcely headed the cart towards them when - crash! the gates banged shut. Then he began to beg: 'Let me in, please be kind!' But the angels did not let him in and said he had come late. Then he saw that there was no business to be done here; there was just nothing for him, and so he turned round. But look! the road he had travelled on had vanished. What was he to do? He addressed himself to the angels again. 'Little dears, please be kind and take me back to the earth, if it's possible! give me a road so that I can get home with my horse and cart!' But the angels said: 'No, child of man, your horse and cart stay here and you can go down how you please.' 'But how shall I let myself down then, I haven't any rope?' 'Just look for something to let yourself down with.' So he took the reins, the bridle and the bit, fastened them all together and began to let himself down. He crawled and he crawled and he looked down - it was still a long way to the earth. He crawled back again and lengthened the rope he had joined together by adding the girth and the traces. Then he began to climb down again and it still did not reach the earth. So he fastened on the shafts and the body of the cart. It was still too short. What was he to do next? He racked his brains and then he thought: 'Ah, I'll lengthen it with my coat and my breeches and my shirt and then with my belt.' And that is what he did, joined everything together and climbed on. When he had reached the end of the belt it was still a long way to the earth. Then he did not know what to do; he had nothing more to fasten on and it was dangerous to jump down: he might break his neck. He begged the angels again: 'Be kind, take me down to the earth!' The angels said: 'Shit, and the muck will make a rope.' So he shat and he shat almost half an hour until he had nothing left to shit with. It made a long rope and he climbed down it. He climbed and he climbed and reached the end of the rope, but it was still a long way to the earth. Then he began once more to beg the angels to take him down to the earth. But the angels said: 'Now, child of man, piss and it will make a silken thread.' The peasant pissed and he pissed, on and on, till he could do no more. He saw that it really had turned into a silken thread and he climbed on. He climbed and he climbed and he reached the end of it, and look, it did not reach to the earth, it still needed one and a half or two fathoms. He begged the angels again to take him down. But the angels said: 'No, brother, there is no help for you now; just jump down!' The peasant dangled undecided; he could not find the courage to jump down. But then he saw that there was no other way out left to him, and bump! instead of jumping down from Heaven he came flying down from the stove and only came to his senses in the middle of the room. Then he woke up and shouted: 'Wife, wife, where are you?' His wife woke up, she heard the din and said: 'The Devil take you, have you gone mad?' She felt round about her and saw the mess: her husband had shat and pissed all over her. She began to rate and to scold him roundly. The peasant said: 'What are you screaming about? There's vexation enough anyway. The horse is lost, stayed behind in Heaven, and I was almost done for. God be thanked that I am alive at least!' 'What rubbish you're talking. You've had much too much to drink. The horse is in the stable and you were on the stove, and dirtied me all over and then jumped down.' Then the man collected himself. Only then did it dawn on him that he had merely dreamt it all; and then he told his wife the dream, how he had journeyed up to Heaven and how from there he came down to the earth again.

¹ Tarasevsky (1909, 196).

At this point, however, psycho-analysis forces on our attention an interpretation which changes our whole view of this class of dreams. Extensible objects, so the experience of interpreting dreams tells us, are ordinarily symbols of erection.¹ In both these anecdotes of dreams the emphasis lies on the element of the thread's refusing to get long enough, and the anxiety in the dream is also attached to this same element. Thread moreover, like all things analogous to it (cord, rope, twine etc.), is a symbol of semen.² The peasant, then, is striving to produce an erection and only when this is unsuccessful does he resort to defaecation. All at once a sexual need comes to view in these dreams behind the excremental one.

This sexual need is, however, much better adapted to explain the remaining constituents of the dream's content. We are bound to admit, if we are ready to assume that these fictitious dreams are essentially correctly constructed, that the dream-action with which they end must have a meaning and must be one intended by the latent thoughts of the dreamer. If the dreamer defaecates over his wife at the end of it, then the whole dream must have this as its aim and provide the reason for this outcome. It can signify nothing else but an insult to the wife, or, strictly speaking, a rejection of her. It is then easy to establish a connection between this and the deeper significance of the anxiety expressed in the dream.

The situation from which this last dream grows can be construed according to these suggestions as follows. The sleeper is overcome by a strong erotic need which is indicated in fairly clear symbols at the beginning of the dream. (He had heard that wheat - probably equivalent to semen - was standing at a high price. He charged forward in order to drive with his horse and cart - genital symbols - through the open gates of Heaven.) But this libidinal impulse probably applies to an unattainable object. The gates close, he gives up his intention and wants to return to the earth. But his wife, who lies by him, does not attract him; he exerts himself in vain to get an erection for her. The wish to discard her in order to replace her by another and better woman is in the infantile sense a death-wish. When someone cherishes such wishes in his unconscious against a person who is nevertheless really loved, they are transformed for him into fear of death, fear for his own life. Hence the presence in these dreams of the state of being dead, the assumption to Heaven, the hypocritical longing to see wife and children again. But the disappointed sexual libido finds release along the path of regression in the excremental wishful impulse, which abuses and soils the unserviceable sexual object.

¹ [*Marginal Note by Oppenheim:*] In a story which comes from Picardy, pushing a ring down on a finger serves as a symbolic way of depicting an erection. The lower the ring goes, the longer the penis becomes - the analogy naturally has a magical force. (*Kryptadia*, 1, No. 32.)

² Cf. Stekel, 1911a.

If this particular dream makes an interpretation of this kind plausible, then, in view of the peculiarities of the material which the dream contains, we can only succeed in proving the interpretation by applying the same one to a whole succession of dreams with an allied content. With this aim in view, let us turn back to the dreams mentioned earlier, where we find the situation of a sleeper who has a man as his bedfellow. The connection in which the woman appears in these dreams now acquires an added significance in retrospect. The sleeper, overcome by a libidinal impulse, rejects the man; he wishes him far away and a woman in his place. A death-wish directed against the dreamer's unwanted male bedfellow is naturally not so severely punished by the moral censorship as one directed against his wife, but the reaction is sufficiently far-reaching to turn the wish against himself or against the female object he desires. The dreamer himself is carried off by death; not the man, but the woman the dreamer longs for, is dead. In the end, however, the rejection of the male sexual object finds an outlet in defiling him, and this is felt and avenged by the other as an affront.

Our interpretation thus fits this group of dreams. If we now turn back to the dreams accompanied by defilement of the woman, we shall be prepared to find that elements missing or only hinted at in the dream we have taken as the type are expressed unmistakably in other similar dreams.

In the following defaecation-dream the dirtying of the woman is not emphasized, but we are told quite clearly, as far as can be in the realm of symbolism, that the libidinal impulse is directed towards another woman. The dreamer does not want to dirty his own field, but intends to defaecate on his neighbour's land.

MUTTON-HEAD!¹

A peasant dreamt that he was at work in his clover field. He was overtaken by an urgent need and, since he did not want to foul his own clover, he hurried off to the tree standing in his neighbour's field, pulled down his breeches and slapped down a pat of number two on to the ground. At last, when he had happily come to an end, he wanted to clean himself and began to tear up grass with a will. But what was that? Our little peasant woke up from his sleep with a jerk, and clutched at his painfully smarting cheek which someone had just slapped. 'You deaf old mutton-head!' - the peasant, coming to himself, heard his wife in bed beside him scolding. 'So you'd go on pulling the hair right off my body would you!'

¹ F. Wernert, 'Deutsche Bauernerzählungen gesammelt im Ober- und Unterelsass [German Peasant-Tales, Collected in Upper and Lower Alsace]', *Anthropophyteia*, 4, 138, No. 173.

Tearing out hair (grass), which here takes the place of defiling, is found mentioned alongside it in the next dream. Psycho-analytic experience shows that it originates from the group of symbols concerning masturbation (*ausreissen*, *abreissen* [to pull out, to pull off]).

The dreamer's death-wish directed against his wife would seem to be what most requires confirming in our interpretation. But in the dream which follows next, the dreamer actually buries his wife (hypocritically designated as a treasure) by digging the vessel which contains the gold into the earth and, as is familiar to us in dreams about treasure, planting a heap of faeces on the top to mark the place. During the digging he is working his hands in his wife's vagina.¹

THE DREAM OF THE TREASURE²

Once upon a time a peasant had a terrible dream. It seemed to him just like it was war-time and the whole district was being plundered by the enemy soldiers. But he had a treasure that he was so scared about that he didn't rightly know what to do with it and where he should really hide it. At last he thought he would bury it in his garden, where he knew of a proper fine place. Now he dreams on further how he goes right out and comes to the place where he wants to dig up the earth so he can put the big pot in the hole. But when he looks for a tool to dig with he finds nix round about, and at last he has to take his hands to it. So he makes the hole with his bare hands, puts the crock with the money into it and covers the whole lot over again with earth. Now he wants to go, but he stops a while standing there and thinks to himself: 'But when the soldiers have gone away again, how'll I find my treasure then if I don't put a sign there?' And straight away he begins to hunt about; he hunts up and down and to and fro, wherever he can. No, in the end he finds nix nowhere that would show him again straight away where he has buried his money. But just then he feels a need. 'Ah,' he says to himself, 'now that'll be fine, I can shit on it.' So of course he pulls his breeches down right away and does a fine heap on the place where he has put the crock in. Then he sees nearby a bit of grass and is going to pull it out, so he cam wipe himself with it. But that moment he gets such a fine clout that for a second he is quite silly and looks round all dazed. And straight after he hears his wife, who is quite beside herself with rage, yelling at him: 'You cheeky bastard, you good-for-nothing! D'you think I've got to put up with everything from you? First you mess about with both hands in my cunt, then you shit on it and now you even want to pull all the hair off it!'

¹ [*Marginal Note by Oppenheim:*] Significance?

² A Riedl, 'Schwänke und Schnurren niederösterreichischer Landleute [Comic and Curious Anecdotes from Lower-Austrian Country People]', *Anthropophyteia*, 5, 10, No. 19.

With this example of a dream we have returned to the treasure-dreams from which we started out, and we observe that those defaecation-dreams which are concerned with treasure contain little or no fear of death, whereas the others, in which the relation to death is expressed directly (dreams of an assumption to Heaven), disregard treasure and motivate the defaecation in other ways. It is almost as though the hypocritical transformation of the wife into a treasure had obviated punishment for the death-wish.¹

A death-wish directed against the woman is most clearly admitted to in another dream of an assumption to Heaven, which, however, ends not in defaecating on the woman's body but in sexual activity involving her genitals, as already happened in the previous dream. The dreamer actually shortens his wife's life in order to lengthen his own, by putting oil from her lamp of life into his own. As a kind of compensation for this undisguised hostility there appears at the end of the dream something like an attempt at a caress.

THE LIGHT OF LIFE²

Saint Peter appeared to a man when he was fast asleep and led him away to Paradise. The man agreed to go with all his heart and went with Saint Peter. They wandered about in Paradise for a long time and came to a copse, which was large and spacious but kept in beautiful order, and where hanging lamps were burning on every tree. The man asked Saint Peter what this could mean. Saint Peter answered that they were hanging lamps which only burned as long as a man lived. But as soon as the oil vanished and the lamp went out, the man had to die at once too. This interested the man very much and he asked Saint Peter if he would lead him to his own hanging lamp. Saint Peter granted his request and led him to his wife's lamp, and just by it was the man's own lamp. The man saw that his wife's lamp still had a lot of oil in it, but there was very little in his own and this made him very sorry because he would have to die soon, and he asked Saint Peter if he would pour a little more oil into his lamp. Saint Peter said that God put the oil in at the moment when a man was born and determined for each the length of his life. This made the man very downcast and he wept and wailed beside his lamp. Saint Peter said to him: 'You stay there, but I must go on - I have more to do.' The man rejoiced at this and hardly was Saint Peter out of sight when he began to dip his finger in his wife's hanging lamp and to drip the oil into his own. He did this several times and when Saint Peter approached he started up terrified, and awoke from his dream, and saw that he had been dipping his finger in his wife's cunt and then dribbling it into his mouth and licking his finger.

Note. According to a version told by a journeyman in Sarajevo, the man awoke after getting a box on the ears from his wife, whom he had awakened by fumbling around in her pudenda. Here Saint Peter is missing and instead of hanging lamps there are glasses with oil burning in them. According to a third version, which I heard from a student in Mostar, a venerable greybeard shows the man various burning candles. His own is very thin, his wife's enormously thick. In order to lengthen his life, the man then begins with burning zeal to lick the thick candle. But then he gets a tremendous clout. 'I knew that you were an ox, but I honestly didn't know that you were a swine as well,' his wife said to him, for he was licking her cunt in his sleep.

The story is extraordinarily widespread in Europe.³

¹ [*Marginal Note by Oppenheim:*] What about the treasure in the dreams of one of two male bedfellows?

² Narrated by a Secondary School teacher in Belgrade, based on a version told by a peasant woman from the region of Kragujevac. *Anthropophyteia*, 4, 255, No. 10.

³ [*Marginal Note by Oppenheim:*] Cf. a very similar story from the Ukraine, *Kryptadia*, 5, 15.

This is the moment to recall the 'bad dream' of the woman who ended by pulling at her husband's organ as if she wanted to tear it out. The interpretation which we found; reason to make in that instance agrees completely with the interpretation of the defaecation-dreams dreamt by men which is expounded here. In the dream of the unsatisfied wife, she, as well, shamelessly gets rid of her husband (and the child) as obstacles in the way of satisfaction.

Another defaecation-dream, about whose interpretation we cannot perhaps be completely certain, suggests, however, that we should concede that there are certain differences in the purpose of these dreams, and throws new light on dreams like the ones we have just mentioned and on some that are still to follow, in which the dream-action consists in a manipulation of the woman's genitals.

'FROM FRIGHT'¹

The Pasha passed the night with the Bey. When the next day came, the Bey lay on in bed and did not want to get up. The Bey asked the Pasha: 'What did you dream?' 'I dreamt that on the minaret there was another minaret.' 'Could that really be?' wondered the Bey. 'And what else did you dream?' 'I dreamt,' he said, 'that on the minaret there stood a copper jug, and there was water in the jug. The wind blew and the copper jug rocked. Now what would you have done if you had dreamt that?' 'I should have pissed myself and shat myself as well, from fright.' 'And, you see, I only pissed myself.'

This dream calls for a symbolic interpretation, because its manifest content is quite incomprehensible whereas the symbols are unmistakably clear. Why should the dreamer really feel frightened at the sight of a water-jug rocking on the tip of a minaret? But a minaret is excellently suited to be a symbol for the penis, and the rhythmically moving water-vessel seems a good symbol of the female genitals in the act of copulation. The Pasha, then, has had a copulation-dream, and if his host suggests defaecation in connection with it this makes it likely that the interpretation is to be sought in the circumstance that both of them are old and impotent men, in whom old age has occasioned the same proverbial replacement of sexual by excremental pleasure which, as we have seen, came about in the other dreams owing to the lack of an appropriate sexual object. For a man who can no longer copulate, so say the common people with their crude love of truth, there still remains the pleasure of shitting; we can say of such a man there is a recurrence of anal erotism, which was there before genital erotism and was repressed and replaced by this later impulse. Defaecation-dreams can thus also be impotence-dreams.

¹ F. S. Krauss, 'Südslavische Volksüberlieferungen, die sich auf den Geschlechtsverkehr beziehen [Southern Slav Folk Traditions concerning Sexual Intercourse]', *Anthropophyteia*, 5, 293, No. 697.

The difference between the interpretations is not so pronounced as might appear at first sight. The defaecation-dreams too, in which the victim is a woman, deal with impotence - relative impotence, at least, towards the particular person who no longer has any attraction for the dreamer. A defaecation-dream thus becomes the dream of a man who can no longer satisfy a woman, as well as of a man whom a woman no longer satisfies.

The same interpretation (as an impotence-dream) can also be applied to a dream in the *Facetiae* of Poggio, which manifestly, it is true, poses as the dream of a jealous man - that is, in fact, of a man who does not think he can satisfy his wife.

THE RING OF FIDELITY¹

Franciscus Philelphus was jealous of his wife and became tormented by the greatest fear that she had to do with another man, and day and night he lay on the watch. Since what occupies us in waking is wont to return to us in dreams, there appeared to him during his sleep a demon, who said to him that if he would act according to his bidding his wife would always remain faithful to him. Franciscus said to him in the dream that he would be very indebted to him and promised him a reward.

'Take this ring,' replied the demon, 'and wear it on your finger with care. As long as you wear it, your wife cannot lie with any other man without your knowledge.'

As he awoke, excited with joy, he felt that he was pushing his finger into the vulva of his wife.

The jealous have no better expedient; in this way their wives can never let themselves be taken by another man without the knowledge of their husbands.

¹ Poggio (1905, No. 133).

This anecdote of Poggio is considered to be the source of a tale by Rabelais, which, in other respects very similar, is clearer inasmuch as it actually describes the husband bringing home a young wife in his old age, who then gives him grounds for jealous fears.¹

Hans Carvel was a learned, experienced, industrious man, a man of honour, of good understanding and judgement, benevolent, charitable to the poor and a cheerful philosopher. Withal a good companion, who was fond of a jest, somewhat corpulent and unsteady, but otherwise well set up in every way. In his old age he married the daughter of Concordat the bailiff, a young, comely, good, gay, lively and pleasing woman, merely perchance a little too friendly towards the gentlemen neighbours and menservants. So it befell that in the course of some weeks he became as jealous as a tiger and was suspicious that she might be getting her buttocks drummed upon elsewhere. To guard against this, he related to her a whole stock of pleasing histories of the punishments for adultery, often read aloud to her lovely legends of virtuous women, preached her the gospel of chastity, wrote her a small volume of songs of praise to matrimonial fidelity, inveighed in sharp and caustic words against the wantonness of undisciplined wives and in addition to all bestowed on her a magnificent necklace set round with oriental sapphires.

But regardless of this, he saw her going about with the neighbours in such a friendly and sociable fashion that his jealousy mounted yet higher. One night at that time, as he was lying with her in bed, in the midst of these painful thoughts, he dreamt he spoke with the Fiend Incarnate and bewailed his grief to him. But the Devil comforted him, put a ring on his finger and said: 'Take this ring; as long as you carry it on your finger no other man can have carnal knowledge of your wife without your knowledge and against your will.' 'A thousand thanks, Sir Devil!' said Hans Carvel, 'I will deny Mahomet before ever I take this ring from my finger.' The Devil disappeared. But Hans Carvel awoke with a joyful heart and found that he had his finger in his wife's what-d'you-call-it.

I forgot to relate how the young woman, when she felt this, jerked her buttocks backwards as if to say: 'Stop! No, no! That's not what ought to be put in there!' - which made Hans Carvel imagine that someone wanted to pull off his ring.

Is that not an infallible measure? Believe me! act after this example and take care at all times to have your wife's ring on your finger!²

The Devil, who appears here as counsellor, as he does in the treasure-dreams, gives us a clue to something of the dreamer's latent thoughts. Originally at least, he was supposed to 'take' the unfaithful wife who is hard to keep a watch on. He then shows in the manifest dream an infallible means of keeping her permanently. In this too we recognize an analogy with the wish to get rid of someone (death-wish) in the defaecation-dreams.

¹ Rabelais, *Pantagruel*, Chapter 28 of *Le Tiers Livre*.

² [Footnote by Freud:] Goethe is concerned with this symbolism of the ring and the finger in a Venetian Epigram (*Paralipomena*, No. 65, Sophienausgabe, Abt. II, Bd. 5, 381).

Costly rings I possess! Excellent stones, engraved
In lofty style and conception, held by the purest of gold;
Dearly men pay for these rings, adorned with fiery stones,
Oft have you seen them sparkle over the gaming-table.
But one little ring I know, whose virtue is not the same,
Which Hans Carvel once possessed, sadly, when he was old.
Foolish he pushed in the ring the smallest of all his ten fingers,
The eleventh, the biggest, alone is worthy and fit to be there.

We will conclude this small collection of dreams by adding a lottery-dream, whose connection with the others is rather slight, but which serves to confirm the suggestion which we put forward earlier that a lottery symbolizes a marriage contract.

IT'S NO USE CRYING OVER SPILT MILK!¹

A merchant had a strange dream. He dreamt that he saw a woman's arse with everything that belonged to it. On one half was a figure 1 and on the other a 3. Before this, the merchant had had the idea of buying a lottery ticket. It seemed to him that this picture in his dream was a lucky omen. Without waiting till the ninth hour, he ran to the bank first thing in the morning, in order to buy his ticket. He arrived there and without pausing to think he demanded ticket Number Thirteen, the same figures that he had seen in his dream. After he had bought his ticket, not a day passed on which he did not look in all the newspapers to see if his number had won. After a week, or at the most after ten days, the list of the draw came out. When he looked through, he saw that his number had not been drawn but the number 103, Series 8, and that number had won 200,000 roubles. The merchant nearly tore his hair out. 'I must have made a mistake! there is something wrong!' He was beside himself, he was almost inconsolable and could not conceive what his having had such a dream could mean. Then he resolved to discuss the matter with his friend to see if he could not account for his misfortune. He met his friend and told him everything in minute detail. Then his friend said: 'Oh you simpleton! Didn't you see the nought between the number 1 and the 3 on the arse?' 'A-a-ah, the Devil take it, it never occurred to me that the arse had a nought.' 'But it was there plain and clear, only you didn't work out the lottery number right. And the number 8 belonging to the series - the cunt shows you that - it's like a number 8.' - It's no use crying over spilt milk!

¹ Tarasevsky (1909, 40).

Our intention in putting together this short paper was twofold. On the one hand we wanted to suggest that one should not be deterred by the often repulsively dirty and indecent nature of this popular material from seeking in it valuable confirmation of psycho-analytic views. Thus on this occasion we have been able to establish the fact that folklore interprets dream-symbols in the same way as psycho-analysis, and that, contrary to loudly proclaimed popular opinion, it derives a group of dreams from needs and wishes which have become immediate. On the other hand, we should like to express the view that it is doing the common people an injustice to assume that they employ this form of entertainment merely to satisfy the coarsest desires. It seems rather that behind these ugly façades are concealed mental reactions to impressions of life which are to be taken seriously, which even strike a sad note - reactions to which common people are ready to surrender, but only if they are accompanied by a yield of coarse pleasure.

ON PSYCHO-ANALYSIS
(1913 [1911])

Intentionally left blank

ON PSYCHO-ANALYSIS

In response to a friendly request by the Secretary of your Section of Neurology and Psychiatry, I venture to draw the attention of this Congress to the subject of psycho-analysis, which is being extensively studied at the present time in Europe and America.

Psycho-analysis is a remarkable combination, for it comprises not only a method of research into the neuroses but also a method of treatment based on the aetiology thus discovered. I may begin by saying that psycho-analysis is not a child of speculation, but the outcome of experience; and for that reason, like every new product of science, is unfinished. It is open to anyone to convince himself by his own investigations of the correctness of the theses embodied in it, and to help in the further development of the study.

Psycho-analysis started with researches into hysteria, but in the course of years it has extended far beyond that field of work. The *Studies on Hysteria* by Breuer and myself, published in 1895, were the beginnings of psycho-analysis. They followed in the track of Charcot's work on 'traumatic' hysteria, Liébeault's and Bernheim's investigations of the phenomena of hypnosis, and Janet's studies of unconscious mental processes. Psycho-analysis soon found itself in sharp opposition to Janet's views, because (a) it declined to trace back hysteria directly to congenital hereditary degeneracy, (b) it offered, instead of a mere description, a dynamic explanation based on the interplay of psychical forces and (c) it ascribed the origin of psychical dissociation (whose importance had been recognized by Janet as well) not to a failure of mental synthesis resulting from a congenital disability, but to a special psychical process known as 'repression' ('*Verdrängung*').

It was conclusively proved that hysterical symptoms are residues (reminiscences) of profoundly moving experiences, which have been withdrawn from everyday consciousness, and that their form is determined (in a manner that excludes deliberate action) by details of the traumatic effects of the experiences. On this view, the therapeutic prospects lie in the possibility of getting rid of this 'repression', so as to allow part of the unconscious psychical material to become conscious and thus to deprive it of its pathogenic power. This view is a dynamic one, in so far as it regards psychical processes as displacements of psychical energy which can be gauged by the amount of their effect on the affective elements. This is most significant in hysteria, where the process of 'conversion' creates the symptoms by transforming a quantity of mental impulses into somatic innervations.

The first psycho-analytic examinations and attempts at treatment were made with the help of hypnotism. Afterwards this was abandoned and the work was carried out by the method of 'free association', with the patient remaining in his normal state. This modification had the advantage of enabling the procedure to be applied to a far larger number of cases of hysteria, as well as to other neuroses and also to healthy people. The development of a special technique of interpretation became necessary, however, in order to draw conclusions from the expressed ideas of the person under investigation. These interpretations established with complete certainty the fact that psychical dissociations are maintained entirely by 'internal resistances'. The conclusion seems justified, therefore, that the dissociations have originated owing to internal conflict, which has led to the 'repression' of the underlying impulse. To overcome this conflict and in that way to cure the neurosis, the guiding hand of a doctor trained in psycho-analysis is required.

Furthermore, it has been shown to be true quite generally that in all neuroses the pathological symptoms are really the end-products of such conflicts, which have led to 'repression' and 'splitting' of the mind. The symptoms are generated by different mechanisms: (a) either as formations in substitution for the repressed forces, or (b) as compromises between the repressing and repressed forces, or (c) as reaction-formations and safeguards against the repressed forces.

Researches were further extended to the conditions which determine whether or not psychical conflicts will lead to 'repression' (that is, to dissociation dynamically caused), since it goes without saying that a psychical conflict, *per se*, may also have a normal outcome. The conclusion arrived at by psycho-analysis was that such conflicts were always between the sexual instincts (using the word 'sexual' in the widest sense) and the wishes and trends of the remainder of the ego. In neuroses it is the sexual instincts that succumb to 'repression' and so constitute the most important basis for the genesis of symptoms, which may accordingly be regarded as substitutes for sexual satisfactions.

Our work on the question of the disposition to neurotic affections has added the 'infantile' factor to the somatic and hereditary ones hitherto recognized. Psycho-analysis was obliged to trace back patients' mental life to their early infancy, and the conclusion was reached that inhibitions of mental development ('infantilisms') present a disposition to neurosis. In particular, we have learnt from our investigations of sexual life that there really is such a thing as 'infantile sexuality', that the sexual instinct is made up of many components and passes through a complicated course of development, the final outcome of which, after many restrictions and transformations, is the 'normal' sexuality of adults. The puzzling perversions of the sexual instinct which occur in adults appear to be either inhibitions of development, fixations or lop-sided growths. Thus neuroses are the negative of perversions.

The cultural development imposed on mankind is the factor which necessitates the restrictions and repressions of the sexual instinct, greater or lesser sacrifices being demanded according to the individual constitution. Development is hardly ever achieved smoothly, and disturbances may occur (whether on account of the individual constitution or of premature sexual incidents) leaving behind a disposition to future neuroses. Such dispositions may remain harmless if the adult's life proceeds satisfactorily and quietly; but they become pathogenic if the conditions of mature life forbid satisfaction of the libido or make too high demands on its suppression.

Researches into the sexual activity of children have led to a further conception of the sexual instinct, based not on its purposes but on its sources. The sexual instinct possesses in a high degree the capacity for being diverted from direct sexual aims and for being directed towards higher aims which are no longer sexual ('sublimation'). The instinct is thus enabled to make most important contributions to the social and artistic achievements of humanity.

Recognition of the simultaneous presence of the three factors of 'infantilism', 'sexuality' and 'repression' constitutes the main characteristic of the psycho-analytic theory, and marks its distinction from other views of pathological mental life. At the same time, psycho-analysis has demonstrated that there is no fundamental difference, but only one of degree, between the mental life of normal people, of neurotics and of psychotics. A normal person has to pass through the same repressions and has to struggle with the same substitutive structures; the only difference is that he deals with these events with less trouble and better success. The psycho-analytic method of investigation can accordingly be applied equally to the explanation of normal psychical phenomena, and has made it possible to discover the close relationship between pathological psychical products and normal structures such as dreams, the small blunders of everyday life, and such valuable phenomena as jokes, myths and imaginative works. The explanation of these has been carried furthest in the case of dreams, and has resulted here in the following general formula: 'A dream is a disguised fulfilment of a repressed wish.' The interpretation of dreams has as its object the removal of the disguise to which the dreamer's thoughts have been subjected. It is, moreover, a highly valuable aid to psycho-analytic technique, for it constitutes the most convenient method of obtaining insight into unconscious psychical life.

There is often a tendency in medical and especially in psychiatric circles to contradict the theories of psycho-analysis without any real study or practical application of them. This is due not only to the striking novelty of these theories and the contrast they present to the views hitherto held by psychiatrists, but also to the fact that the premisses and technique of psycho-analysis are much more nearly related to the field of psychology than to that of medicine. It cannot be disputed, however, that purely medical and non-psychological teachings have hitherto done very little towards an understanding of mental life. The progress of psycho-analysis is further retarded by the dread felt by the average observer of seeing himself in his own mirror. Men of science tend to meet emotional resistances with arguments, and thus satisfy themselves to their own satisfaction! Whoever wishes not to ignore a truth will do well to distrust his antipathies, and, if he wishes to submit the theory of psycho-analysis to a critical examination, let him first analyse himself.

I cannot think that in these few sentences I have succeeded in painting a clear picture of the principles and purposes of psycho-analysis. But I will add a list of the chief publications on the subject, a study of which will give further enlightenment to any whom I may have interested.

FORMULATIONS ON THE TWO PRINCIPLES OF MENTAL FUNCTIONING
(1911)

Intentionally left blank

FORMULATIONS ON THE TWO PRINCIPLES OF MENTAL FUNCTIONING

We have long observed that every neurosis has as its result, and probably therefore as its purpose, a forcing of the patient out of real life, an alienating of him from reality. Nor could a fact such as this escape the observation of Pierre Janet; he spoke: of a loss of '*la fonction du réel*' ['the function of reality'] as being a special characteristic of neurotics, but without discovering the connection of this disturbance with the fundamental determinants of neurosis.¹ By introducing the process of repression into the genesis of the neuroses we have been able to gain some insight into this connection. Neurotics turn away from reality because they find it unbearable - either the whole or parts of it. The most extreme type of this turning away from reality is shown by certain cases of hallucinatory psychosis which seek to deny the particular event that occasioned the outbreak of their insanity (Griesinger). But in fact every neurotic does the same with some fragment of reality.² And we are now confronted with the task of investigating the development of the relation of neurotics and of mankind in general to reality, and in this way of bringing the psychological significance of the real external world into the structure of our theories.

In the psychology which is founded on psycho-analysis we have become accustomed to taking as our starting-point the unconscious mental processes, with the peculiarities of which we have become acquainted through analysis. We consider these to be the older, primary processes, the residues of a phase of development in which they were the only kind of mental process. The governing purpose obeyed by these primary processes is easy to recognize; it is described as the pleasure-unpleasure [*Lust-Unlust*] principle, or more shortly the pleasure principle. These processes strive towards gaining pleasure; psychical activity draws back from any event which might arouse unpleasure. (Here we have repression.) Our dreams at night and our waking tendency to tear ourselves away from distressing impressions are remnants of the dominance of this principle and proofs of its power.

¹ Janet, 1909.

² Otto Rank (1910) has recently drawn attention to a remarkably clear prevision of this causation shown in Schopenhauer's *The World as Will and Idea*.

I shall be returning to lines of thought which I have developed elsewhere¹ when I suggest that the state of psychical rest was originally disturbed by the peremptory demands of internal needs. When this happened, whatever was thought of (wished for) was simply presented in a hallucinatory manner, just as still happens to-day with our dream-thoughts every night.² It was only the non-occurrence of the expected satisfaction, the disappointment experienced, that led to the abandonment of this attempt at satisfaction by means of hallucination. Instead of it, the psychical apparatus had to decide to form a conception of the real circumstances in the external world and to endeavour to make a real alteration in them. A new principle of mental functioning was thus introduced; what was presented in the mind was no longer what was agreeable but what was real, even if it happened to be disagreeable.³ This setting-up of the *reality principle* proved to be a momentous step.

¹ In the General Section of *The Interpretation of Dreams*.

² The state of sleep is able to re-establish the likeness of mental life as it was before the recognition of reality, because a prerequisite of sleep is a deliberate rejection of reality (the wish to sleep).

³ I will try to simplify the above schematic account with some further details. It will rightly be objected that an organization which was a slave to the pleasure principle and neglected the reality of the external world could not maintain itself alive for the shortest time, so that it could not have come into existence at all. The employment of a fiction like this is, however, justified when one considers that the infant - provided one includes with it the care it receives from its mother - does almost realize a psychical system of this kind. It probably hallucinates the fulfilment of its internal needs; it betrays its unpleasure, when there is an increase of stimulus and an absence of satisfaction, by the motor discharge of screaming and beating about with its arms and legs, and it then experiences the satisfaction it has hallucinated. Later, as an older child, it learns to employ these manifestations of discharge intentionally as methods of expressing its feelings. Since the later care of children is modelled on the care of infants, the dominance of the pleasure principle can really come to an end only when a child has achieved complete psychical detachment from its parents. - A neat example of a psychical system shut off from the stimuli of the external world, and able to satisfy even its nutritional requirements autistically (to use Bleuler's term), is afforded by a bird's egg with its food supply enclosed in its shell; for it, the care provided by its mother is limited to the provision of warmth. - I shall not regard it as a correction, but as an amplification of the schematic picture under discussion, if it is insisted that a system living according to the pleasure principle must have devices to enable it to withdraw from the stimuli of reality. Such devices are merely the correlative of 'repression', which treats internal unpleasurable stimuli as if they were external - that is to say, pushes them into the external world.

(1) In the first place, the new demands made a succession of adaptations necessary in the psychical apparatus, which, owing to our insufficient or uncertain knowledge, we can only retail very cursorily.

The increased significance of external reality heightened the importance, too, of the sense-organs that are directed towards that external world, and of the *consciousness* attached to them. Consciousness now learned to comprehend sensory qualities in addition to the qualities of pleasure and unpleasure which hitherto had alone been of interest to it. A special function was instituted which had periodically to search the external world, in order that its data might be familiar already if an urgent internal need should arise - the function of *attention*. Its activity meets the sense-impressions half way, instead of awaiting their appearance. At the same time, probably, a system of *notation* was introduced, whose task it was to lay down the results of this periodical activity of consciousness - a part of what we call *memory*.

The place of repression, which excluded from cathexis as productive of unpleasure some of the emerging ideas, was taken by an *impartial passing of judgement*, which had to decide whether a given idea was true or false - that is, whether it was in agreement with reality or not - the decision being determined by making a comparison with the memory-traces of reality.

A new function was now allotted to motor discharge, which, under the dominance of the pleasure principle, had served as a means of unburdening the mental apparatus of accretions of stimuli, and which had carried out this task by sending innervations into the interior of the body (leading to expressive movements and the play of features and to manifestations of affect). Motor discharge was now employed in the appropriate alteration of reality; it was converted into *action*.

Restraint upon motor discharge (upon action), which then became necessary, was provided by means of the process of *thinking*, which was developed from the presentation of ideas. Thinking was endowed with characteristics which made it possible for the mental apparatus to tolerate an increased tension of stimulus while the process of discharge was postponed. It is essentially an experimental kind of acting, accompanied by displacement of relatively small quantities of cathexis together with less expenditure (discharge) of them. For this purpose the conversion of freely displaceable cathexes into 'bound' cathexes was necessary, and this was brought about by means of raising the level of the whole cathectic process. It is probable that thinking was originally unconscious, in so far as it went beyond mere ideational presentations and was directed to the relations between impressions of objects, and that it did not acquire further qualities, perceptible to consciousness, until it became connected with verbal residues.

(2) A general tendency of our mental apparatus, which can be traced back to the economic principle of saving expenditure, seems to find expression in the tenacity with which we hold on to the sources of pleasure at our disposal, and in the difficulty with which we renounce them. With the introduction of the reality principle one species of thought-activity was split off; it was kept free from reality-testing and remained subordinated to the pleasure principle alone.¹ This activity is *phantasying*, which begins already in children's play, and later, continued as *day-dreaming*, abandons dependence on real objects.

(3) The supersession of the pleasure principle by the reality principle, with all the psychical consequences involved, which is here schematically condensed into a single sentence, is not in fact accomplished all at once; nor does it take place simultaneously all along the line. For while this development is going on in the ego-instincts, the sexual instincts become detached from them in a very significant way. The sexual instincts behave auto-erotically at first; they obtain their satisfaction in the subject's own body and therefore do not find themselves in the situation of frustration which was what necessitated the institution of the reality principle; and when, later on, the process of finding an object begins, it is soon interrupted by the long period of latency, which delays sexual development until puberty. These two factors - auto-erotism and the latency period - have as their result that the sexual instinct is held up in its psychical development and remains far longer under the dominance of the pleasure principle, from which in many people it is never able to withdraw.

In consequence of these conditions, a closer connection arises, on the one hand, between the sexual instinct and phantasy and, on the other hand, between the ego-instincts and the activities of consciousness. Both in healthy and in neurotic people this connection strikes us as very intimate, although the considerations of genetic psychology which have just been put forward lead us to recognize it as a *secondary* one. The continuance of auto-erotism is what makes it possible to retain for so long the easier momentary and imaginary satisfaction in relation to the sexual object in place of real satisfaction, which calls for effort and postponement. In the realm of phantasy, repression remains all-powerful; it brings about the inhibition of ideas *in statu nascendi* before they can be noticed by consciousness, if their cathexis is likely to occasion a release of unpleasure. This is the weak spot in our psychical organization; and it can be employed to bring back under the dominance of the pleasure principle thought-processes which had already become rational. An essential part of the psychical disposition to neurosis thus lies in the delay in educating the sexual instincts to pay regard to reality and, as a corollary, in the conditions which make this delay possible.

¹ In the same way, a nation whose wealth rests on the exploitation of the produce of its soil will yet set aside certain areas for reservation in their original state and for protection from the changes brought about by civilization. (E.g. Yellowstone Park.)

(4) Just as the pleasure-ego can do nothing but *wish*, work for a yield of pleasure, and avoid unpleasure, so the reality-ego need do nothing but strive for what is *useful* and guard itself against damage.¹ Actually the substitution of the reality principle for the pleasure principle implies no deposing of the pleasure principle, but only a safeguarding of it. A momentary pleasure, uncertain in its results, is given up, but only in order to gain along the new path an assured pleasure at a later time. But the endopsychic impression made by this substitution has been so powerful that it is reflected in a special religious myth. The doctrine of reward in the after-life for the - voluntary or enforced - renunciation of earthly pleasures is nothing other than a mythical projection of this revolution in the mind. Following consistently along these lines, *religions* have been able to effect absolute renunciation of pleasure in this life by means of the promise of compensation in a future existence; but they have not by this means achieved a conquest of the pleasure principle. It is *science* which comes nearest to succeeding in that conquest; science too, however, offers intellectual pleasure during its work and promises practical gain in the end.

(5) *Education* can be described without more ado as an incitement to the conquest of the pleasure principle, and to its replacement by the reality principle; it seeks, that is, to lend its help to the developmental process which affects the ego. To this end it makes use of an offer of love as a reward from the educators; and it therefore fails if a spoilt child thinks that it possesses that love in any case and cannot lose it whatever happens.

(6) *Art* brings about a reconciliation between the two principles in a peculiar way. An artist is originally a man who turns away from reality because he cannot come to terms with the renunciation of instinctual satisfaction which it at first demands, and who allows his erotic and ambitious wishes full play in the life of phantasy. He finds the way back to reality, however, from this world of phantasy by making use of special gifts to mould his phantasies into truths of a new kind, which are valued by men as precious reflections of reality. Thus in a certain fashion he actually becomes the hero, the king, the creator, or the favourite he desired to be, without following the one roundabout path of making real alterations in the external world. But he can only achieve this because other men feel the same dissatisfaction as he does with the renunciation demanded by reality, and because that dissatisfaction, which results from the replacement of the pleasure principle by the reality principle, is itself a part of reality.²

(7) While the ego goes through its transformation from a *pleasure-ego* into a *reality-ego*, the sexual instincts undergo the changes that lead them from their original auto-erotism through various intermediate phases to object-love in the service of procreation. If we are right in thinking that each step in these two courses of development may become the site of a disposition to later neurotic illness, it is plausible to suppose that the form taken by the subsequent illness (the *choice of neurosis*) will depend on the particular phase of the development of the ego and of the libido in which the dispositional inhibition of development has occurred. Thus unexpected significance attaches to the chronological features of the two developments (which have not yet been studied), and to possible variations in their synchronization.

¹ The superiority of the reality-ego over the pleasure-ego has been aptly expressed by Bernard Shaw in these words: 'To be able to choose the line of greatest advantage instead of yielding in the direction of least resistance.' (*Man and Superman*.)

² Cf. the similar position taken by Otto Rank (1907).

(8) The strangest characteristic of unconscious (repressed) processes, to which no investigator can become accustomed without the exercise of great self-discipline, is due to their entire disregard of reality-testing; they equate reality of thought with external actuality, and wishes with their fulfilment - with the event - just as happens automatically under the dominance of the ancient pleasure principle. Hence also the difficulty of distinguishing unconscious phantasies from memories which have become unconscious. But one must never allow oneself to be misled into applying the standards of reality to repressed psychical structures, and on that account, perhaps, into undervaluing the importance of phantasies in the formation of symptoms on the ground that they are not actualities, or into tracing a neurotic sense of guilt back to some other source because there is no evidence that any actual crime has been committed. One is bound to employ the currency that is in use in the country one is exploring - in our case a neurotic currency. Suppose, for instance, that one is trying to solve a dream such as this. A man who had once nursed his father through a long and painful mortal illness, told me that in the months following his father's death he had repeatedly dreamt that *his father was alive once more and that he was talking to him in his usual way. But he felt it exceedingly painful that his father had really died, only without knowing it.* The only way of understanding this apparently nonsensical dream is by adding 'as the dreamer wished' or 'in consequence of his wish' after the words 'that his father had really died', and by further adding 'that he wished it' to the last words. The dream-thought then runs: it was a painful memory for him that he had been obliged to wish for his father's death (as a release) while he was still alive, and how terrible it would have been if his father had had any suspicion of it! What we have here is thus the familiar case of self-reproaches after the loss of someone loved, and in this instance the self-reproach went back to the infantile significance of death-wishes against the father.

The deficiencies of this short paper, which is preparatory rather than expository, will perhaps be excused only in small part if I plead that they are unavoidable. In these few remarks on the psychical consequences of adaptation to the reality principle I have been obliged to adumbrate views which I should have preferred for the present to withhold and whose justification will certainly require no small effort. But I hope it will not escape the notice of the benevolent reader how in these pages too the dominance of the reality principle is beginning.

TYPES OF ONSET OF NEUROSIS (1912)

Intentionally left blank

TYPES OF ONSET OF NEUROSIS

In the pages which follow, I shall describe, on the basis of impressions arrived at empirically, the changes which conditions must undergo in order to bring about the outbreak of a neurotic illness in a person with a disposition to it. I shall thus be dealing with the question of the precipitating factors of illnesses and shall have little to say about their forms. The present discussion of the precipitating causes will differ from others in that the changes to be enumerated will relate exclusively to the subject's libido. For psycho-analysis has taught us that the vicissitudes of the libido are what decide in favour of nervous health or sickness. Nor are words to be wasted in this connection on the concept of disposition. It is precisely psycho-analytic research which has enabled us to show that neurotic disposition lies in the history of the development of the libido, and to trace back the operative factors in that development to innate varieties of sexual constitution and to influences of the external world experienced in early childhood.

(a) The most obvious, the most easily discoverable and the most intelligible precipitating cause of an onset of neurosis is to be seen in the external factor which may be described in general terms as *frustration*. The subject was healthy so long as his need for love was satisfied by a real object in the external world; he becomes neurotic as soon as this object is withdrawn from him without a substitute taking its place. Here happiness coincides with health and unhappiness with neurosis. It is easier for fate to bring about a cure than for the physician; for it can offer the patient a substitute for the possibility of satisfaction which he has lost.

Thus with this type, to which, no doubt, the majority of human beings on the whole belong, the possibility of falling ill arises only when there is abstinence. And it may be judged from this what an important part in the causation of neuroses may be played by the limitation imposed by civilization on the field of accessible satisfactions. Frustration has a pathogenic effect because it dams up libido, and so submits the subject to a test as to how long he can tolerate this increase in psychical tension and as to what methods he will adopt for dealing with it. There are only two possibilities for remaining healthy when there is a persistent frustration of satisfaction in the real world. The first is by transforming the psychical tension into active energy which remains directed towards the external world and eventually extorts a real satisfaction of the libido from it. The second is by renouncing libidinal satisfaction, sublimating the dammed-up libido and turning it to the attainment of aims which are no longer erotic and which escape frustration. That these two possibilities are realized in men's lives proves that unhappiness does not coincide with neurosis and that frustration does not alone decide whether its victim remains healthy or falls ill. The immediate effect of frustration lies in its bringing into play the dispositional factors which have hitherto been inoperative.

Where these are present and sufficiently strongly developed, there is a risk of the libido becoming 'introverted'.¹ It turns away from reality, which, owing to the obstinate frustration, has lost its value for the subject, and turns towards the life of phantasy, in which it creates new wishful structures and revives the traces of earlier, forgotten ones. In consequence of the intimate connection between the activity of phantasy and material present in everyone which is infantile and repressed and has become unconscious, and thanks to the exceptional position enjoyed by the life of phantasy in regard to reality-testing,² the libido may thenceforward move on a backward course; it may follow the path of *regression* along infantile lines, and strive after aims that correspond with them. If these strivings, which are incompatible with the subject's present-day individuality, acquire enough intensity, a conflict must result between them and the other portion of his personality, which has maintained its relation to reality. This conflict is resolved by the formation of symptoms, and is followed by the onset of manifest illness. The fact that the whole process originated from frustration in the real world is reflected in the resulting event that the symptoms, in which the ground of reality is reached once more, represent substitutive satisfactions.

¹ To use a term introduced by C. G. Jung.

² See my 'Formulations on the Two Principles of Mental Functioning' (1911*b*).

(b) The second type of precipitating cause of falling ill is by no means so obvious as the first; and it was in fact only possible to discover it through searching analytic investigations following on the Zurich school's theory of complexes.¹ Here the subject does not fall ill as a result of a change in the external world which has replaced satisfaction by frustration, but as a result of an internal effort to obtain the satisfaction which is accessible to him in reality. He falls ill of his attempt to adapt himself to reality and to fulfil *the demands of reality* - an attempt in the course of which he comes up against insurmountable internal difficulties.

It is advisable to draw a sharp distinction between the two types of onset of illness - a sharper distinction than observation as a rule permits. In the first type what is prominent is a change in the external world; in the second type the accent falls on an internal change. In the first type the subject falls ill from an experience; in the second type it is from a developmental process. In the first case he is faced by the task of renouncing satisfaction, and he falls ill from his incapacity for resistance; in the second case his task is to exchange one kind of satisfaction for another, and he breaks down from his inflexibility. In the second case the conflict, which is between the subject's effort to remain as he is and the effort to change himself in order to meet fresh purposes and fresh demands from reality, is present from the first. In the former case the conflict only arises after the dammed-up libido has chosen other, and incompatible, possibilities of satisfaction. The part played by the conflict and the previous fixation of the libido is incomparably more obvious in the second type than in the first, in which such unserviceable fixations may perhaps only emerge as a result of the external frustration.

¹ Cf. Jung (1909).

A young man who has hitherto satisfied his libido by means of phantasies ending in masturbation, and who now seeks to replace a régime approximating to auto-erotism by the choice of a real object - or a girl who has given her whole affection to her father or brother and who must now, for the sake of a man who is courting her, allow her hitherto unconscious incestuous libidinal wishes to become conscious - or a married woman who would like to renounce her polygamous inclinations and phantasies of prostitution so as to become a faithful consort to her husband and a perfect mother to her child - all of these fall ill from the most laudable efforts, if the earlier fixations of their libido are powerful enough to resist a displacement; and this point will be decided, once again, by the factors of disposition, constitution and infantile experience. All of them, it might be said, meet with the fate of the little tree in the Grimms' fairy tale, which wished it had different leaves. From the hygienic point of view - which, to be sure, is not the only one to be taken into account - one could only wish for them that they had continued to be as undeveloped, as inferior and as useless as they were before they fell ill. The change which the patients strive after, but bring about only imperfectly or not at all, invariably has the value of a step forward from the point of view of real life. It is otherwise if we apply ethical standards: we see people falling ill just as often when they discard an ideal as when they seek to attain it.

In spite of the very clear differences between the two types of onset of illness that we have described, they nevertheless coincide in essentials and can without difficulty be brought together into a unity. Falling ill from frustration may also be regarded as incapacity for adaptation to reality - in the particular case, that is, in which reality frustrates satisfaction of libido. Falling ill under the conditions of the second type leads directly to a special case of frustration. It is true that reality does not here frustrate every kind of satisfaction; but it frustrates the one kind which the subject declares is the only possible one. Nor does the frustration come immediately from the external world, but primarily from certain trends in the subject's ego. Nevertheless, frustration remains the common factor and the more inclusive one. In consequence of the conflict which immediately sets in in the second type, both kinds of satisfaction - the habitual one as well as the one aimed at - are equally inhibited; a damming-up of libido, with all its consequences, comes about just as it does in the first case. The psychical events leading to the formation of symptoms are if anything easier to follow in the second type than in the first; for in the second type the pathogenic fixations of the libido do not need to be freshly established, but have already been in force while the subject was healthy. A certain amount of introversion of libido is, as a rule, already present; and there is a saving of some part of the subject's regression to the infantile stage, owing to the fact that his forward development has not yet completed its course.

(c) The next type, which I shall describe as falling ill from an *inhibition in development*, looks like an exaggeration of the second one - falling ill from the demands of reality. There is no theoretical reason for distinguishing it, but only a practical one; for those we are here concerned with are people who fall ill as soon as they get beyond the irresponsible age of childhood, and who have thus never reached a phase of health - a phase, that is, of capacity for achievement and enjoyment which is on the whole unrestricted. The essential feature of the dispositional process is in these cases quite plain. Their libido has never left its infantile fixations; the demands of reality are not suddenly made upon a wholly or partly mature person, but arise from the very fact of growing older, since it is obvious that they constantly alter with the subject's increasing age. Thus conflict falls into the background in comparison with insufficiency. But here, too, all our other experience leads us to postulate an effort at overcoming the fixations of childhood; for otherwise the outcome of the process could never be neurosis but only a stationary infantilism.

(d) Just as the third type has brought the dispositional determinant before us almost in isolation, so the fourth type, which now follows, draws our attention to another factor, which comes into consideration in every single case and might easily for that very reason be overlooked in a theoretical discussion. We see people fall ill who have hitherto been healthy, who have met with no fresh experience and whose relation to the external world has undergone no change, so that the onset of their illness inevitably gives an impression of spontaneity. A closer consideration of such cases, however, shows us that none the less a change *has* taken place in them whose importance we must rate very highly as a cause of illness. As a result of their having reached a particular period of life, and in conformity with regular biological processes, the *quantity* of libido in their mental economy has experienced an increase which is in itself enough to upset the equilibrium of their health and to set up the necessary conditions for a neurosis. It is well known that more or less sudden increases of libido of this kind are habitually associated with puberty and the menopause - with the attainment of a certain age in women; in some people they may in addition be manifested in periodicities that are still unknown. Here the damming-up of libido is the primary factor; it becomes pathogenic as a consequence of a *relative* frustration on the part of the external world, which would still have granted satisfaction to a smaller claim by the libido. The unsatisfied and dammed-up libido can once again open up paths to regression and kindle the same conflicts which we have demonstrated in the case of absolute external frustration. We are reminded in this way that the quantitative factor should not be left out of account in any consideration of the precipitating causes of illness. All the other factors - frustration, fixation, developmental inhibition - remain ineffective unless they affect a certain amount of libido and bring about a damming-up of libido of a certain height. It is true that we are unable to measure this amount of libido which seems to us indispensable for a pathogenic effect; we can only postulate it after the resulting illness has started. There is only one direction in which we can determine it more precisely. We may assume that it is not a question of an *absolute* quantity, but of the relation between the quota of libido in operation and the quantity of libido which the individual ego is able to deal with - that is, to hold under tension, to sublimate or to employ directly. For this reason a *relative* increase in the quantity of libido may have the same effects as an absolute one. An enfeeblement of the ego owing to organic illness or owing to some special demand upon its energy will be able to cause the emergence of neuroses which would otherwise have remained latent in spite of any disposition that might be present.

The importance in the causation of illness which must be ascribed to *quantity* of libido is in satisfactory agreement with two main theses of the theory of the neuroses to which psycho-analysis has led us: first, the thesis that the neuroses are derived from the conflict between the ego and the libido, and secondly, the discovery that there is no *qualitative* distinction between the determinants of health and those of neurosis, and that, on the contrary, healthy people have to contend with the same tasks of mastering their libido - they have simply succeeded better in them.

It remains to say a few words on the relation of these types to the facts of observation. If I survey the set of patients on whose analysis I am at the moment engaged, I must record that not one of them is a pure example of any of the four types of onset. In each of them, rather, I find a portion of frustration operating alongside of a portion of incapacity to adapt to the demands of reality; inhibition in development, which coincides, of course, with inflexibility of fixations, has to be reckoned with in all of them, and, as I have already said, the importance of quantity of libido must never be neglected. I find, indeed, that in several of these patients their illness has appeared in successive waves, between which there have been healthy intervals, and that each of these waves has been traceable to a different type of precipitating cause. Thus the erection of these four types cannot lay claim to any high theoretical value; they are merely different ways of establishing a particular pathogenic constellation in the mental economy - namely the damming-up of libido, which the ego cannot, with the means at its command, ward off without damage. But this situation itself only becomes pathogenic as a result of a quantitative factor; it does not come as a novelty to mental life and is not created by the impact of what is spoken of as a 'cause of illness'.

A certain *practical* importance may readily be allowed to these types of onset. They are to be met with in their pure form, indeed, in individual cases; we should not have noticed the third and fourth types if they had not in some subjects constituted the sole precipitating causes of the illness. The first type keeps before our eyes the extraordinarily powerful influence of the external world, and the second the no less important influence - which opposes the former one - of the subject's peculiar individuality. Pathology could not do justice to the problem of the precipitating factors in the neuroses so long as it was merely concerned with deciding whether those affections were of an 'endogenous' or 'exogenous' nature. It was bound to meet every observation which pointed to the importance of abstinence (in the widest sense of the word) as a precipitating cause with the objection that other people tolerate the same experiences without falling ill. If, however, it sought to lay stress on the peculiar individuality of the subject as being the essential factor decisive between illness and health, it was obliged to put up with the proviso that people possessing such a peculiarity can remain healthy indefinitely, just so long as they are able to retain that peculiarity. Psychoanalysis has warned us that we must give up the unfruitful contrast between external and internal factors, between experience and constitution, and has taught us that we shall invariably find the cause of the onset of neurotic illness in a particular psychical situation which can be brought about in a variety of ways.

CONTRIBUTIONS TO A DISCUSSION ON MASTURBATION

I

INTRODUCTION

It is never the aim of the discussions in the Vienna Psycho-Analytical Society to remove diversities or to arrive at conclusions. The different speakers, who are held together by taking a similar fundamental view of the same facts, allow themselves to give the sharpest expression to the variety of their individual opinions without any regard to the probability of converting any of their audience who may think otherwise. There may be many points in these discussions which have been misstated and misunderstood, but the final outcome, nevertheless, is that every one has received the clearest impression of views differing from his own and has communicated his own differing views to other people.

The discussion on masturbation, of which actually only fragments are published here, lasted for several months and was conducted on the plan of each speaker in turn reading a paper, which was followed by an exhaustive debate. Only the actual papers are included in the present publication, and not the debates, which were highly stimulating and in which the differing opinions were expressed and defended. This pamphlet would otherwise have attained dimensions which would certainly have stood in the way of its being widely read and proving effective.

The choice of the topic calls for no apologies in these days when an attempt is at last being made to subject the problems of man's sexual life to a scientific examination. Numerous repetitions of the same thoughts and assertions were unavoidable: they are, of course, the signs of agreement between the speakers. As regards the many divergences in their views, it can no more be an editor's task to harmonize them than it is to attempt to hide them. It is to be hoped that the reader's interest will be repelled neither by the repetitions nor by the contradictions.

It has been our purpose on this occasion to show the direction into which the study of the problem of masturbation has been forced by the emergence of the psycho-analytic method of approach. How far we have succeeded in that purpose will appear from our readers' applause, or perhaps still more clearly from their disapproval.

II

CONCLUDING REMARKS

GENTLEMEN, - The older members of this group will be able to recall that some years ago we made a previous attempt at a collective discussion of this kind - a 'symposium', as our American colleagues call it - on the subject of masturbation. At that time the opinions expressed showed such important divergences that we did not venture to lay our proceedings before the public. Since then the same group, together with some newcomers, having been uninterruptedly in touch with observed facts, and having had a constant interchange of ideas with one another, have so far clarified their views and arrived at common ground that the venture which we previously abandoned now no longer seems so rash. I really have an impression that the points on which we are agreed in connection with masturbation are now firmer and more deep-going than the disagreements - though these undeniably exist. Some of the apparent contradictions are only the result of the many different directions from which you have approached the subject, whereas in fact the opinions in question may quite well find a place alongside one another.

With your permission I will set before you a summary of the points on which we seem to be agreed or divided.

We are all *agreed*, I feel,

(a) on the importance of the phantasies which accompany or represent the act of masturbation,

(b) on the importance of the sense of guilt, whatever its source may be, which is attached to masturbation, and

(c) on the impossibility of assigning a qualitative determinant for the injurious effects of masturbation. (On this last point agreement is not unanimous.)

Unresolved differences of opinion have appeared

(a) in respect to a denial of a somatic factor in the effects of masturbation,

(b) in respect to a general denial of the injurious effects of masturbation,

(c) with regard to the origin of the sense of guilt, which some of you wish to attribute directly to lack of satisfaction, while others adduce social factors in addition, or the attitude of the subject's personality at the moment, and

(d) with regard to the ubiquity of masturbation in children.

Lastly, significant *uncertainties* exist

(a) as to the mechanism of the injurious effects of masturbation, if there are any, and

(b) as to the aetiological relation of masturbation to the 'actual neuroses'.

As regards the majority of the points of controversy among us, we have to thank the challenging criticisms of our colleague Wilhelm Stekel, based on his great and independent experience. There is no doubt that we have left very many points over to be established and clarified by some future band of observers and enquirers. But we may console ourselves with the knowledge that we have worked honestly and in no narrow spirit, and that in so doing we have opened up paths along which later research will be able to travel.

You must not expect much from my own contributions to the questions we are concerned with. You are aware of my preference for the fragmentary treatment of a subject, with emphasis on the points which seem to me best established. I have nothing new to offer - no solutions, only a few repetitions of things I have already maintained, a few words in defence of these old assertions against attacks made upon them by some of you, and in addition, a few comments which must inevitably force themselves on anyone listening to your papers.

I have, as you know, divided masturbation according to the subject's age into (1) masturbation in infants, which includes all auto-erotic activities serving the purpose of sexual satisfaction, (2) masturbation in children, which arises directly out of the preceding kind and has already become fixed to certain erotogenic zones, and (3) masturbation at puberty, which is either continuous with childhood masturbation or is separated from it by the period of latency. In some of the accounts which I have heard you give, full justice has not quite been done to this temporal division. The ostensible unity of masturbation, which is fostered by the customary medical terminology, has given rise to some generalizations where a differentiation according to the three periods of life would have been better justified. It has been a matter for regret, too, that we have not been able to pay as much attention to female as to male masturbation; female masturbation, I believe, is deserving of a special study and in its case it is particularly true that a special emphasis lies on the modifications in it that arise in relation to the subject's age.

I come now to the objections raised by Reitler to my teleological argument in favour of the ubiquity of masturbation in infancy. I admit that this argument must be abandoned. If one more edition of my *Three Essays on the Theory of Sexuality* is called for, it will not contain the sentence under attack. I will renounce my attempt at guessing the purposes of Nature and will content myself with describing the facts.

Another remark of Reitler's is, I think, significant and important. This was to the effect that certain arrangements in the genital apparatus which are peculiar to human beings seem to tend towards preventing sexual intercourse in childhood. Here, however, my doubts arise. The occlusion of the female sexual orifice and the absence of an *os penis* which would assure erection are, after all, directed only against actual coition, not against sexual excitations in general. Reitler seems to me to take too anthropomorphic a view of the way in which Nature pursues her aims - as though it were a question of her carrying through a single purpose, as is the case with human activity. But so far as we can see, in natural processes a whole number of aims are pursued alongside one another, without interfering with one another. If we are to speak of Nature in human terms, we shall have to say that she appears to us to be what, in the case of men, we should call inconsistent. For my part, I think Reitler should not attach so much weight to his own teleological arguments. The use of teleology as a heuristic hypothesis has its dubious side: in any particular instance one can never tell whether one has hit upon a 'harmony' or a 'disharmony'. It is the same as when one drives a nail into the wall of a room: one cannot be certain whether one is going to come up against lath and plaster or brick-work.

On the question of the relation of masturbation and emissions to the causation of so-called 'neurasthenia', I find myself like many of you, in opposition to Stekel, and, subject to a limitation which I shall mention presently, I maintain, as against him, my former views. I see nothing that could oblige us to abandon the distinction between 'actual neuroses' and psychoneuroses, and I cannot regard the genesis of the symptoms in the case of the former as anything but toxic. Here Stekel really seems to me greatly to overstretch psychogenicity. My view is still what it was in the first instance, more than fifteen years ago: namely, that the two 'actual neuroses' - neurasthenia and anxiety neurosis (and perhaps we ought to add hypochondria proper as a third 'actual neurosis') - provide the psychoneuroses with the necessary 'somatic compliance'; they provide the excitatory material, which is then psychically selected and given a 'psychical coating', so that, speaking generally, the nucleus of the psychoneurotic symptom - the grain of sand at the centre of the pearl - is formed of a somatic sexual manifestation. This is clearer, it is true, of anxiety neurosis and its relation to hysteria than it is of neurasthenia, into which no careful psycho-analytic investigations have yet been made. In anxiety neurosis, as you have often been able to convince yourselves, it is at bottom a small fragment of undischarged excitation connected with coition which emerges as an anxiety symptom or provides the nucleus for the formation of a hysterical symptom.

Stekel shares with many non-psycho-analytic writers an inclination to reject the morphological differentiations which we have made within the jumble of the neuroses and to lump them all together under one heading - under psychasthenia, perhaps. We have often contradicted him on this, and have held fast to our expectation that the morphologico-clinical differences will prove valuable as indications that have not yet been understood of essentially distinct processes. When he - justly - points out to us that he has regularly found the same complexes present in what are termed neurasthenics as in other neurotics, his argument fails to meet the point at issue. We have long known that the same complexes and conflicts are to be looked for, too, in all normal and healthy people. In fact, we have grown accustomed to attributing to every civilized human being a certain amount of repression of perverse impulses, a certain amount of anal erotism, of homosexuality and so on, as well as a piece of father-complex and mother-complex and of other complexes besides - just as in the chemical analysis of an organic substance we have every hope of finding certain elements: carbon, oxygen, hydrogen, nitrogen and a trace of sulphur. What distinguishes organic substances from one another is the relative amounts of these elements and the way in which the links between them are constituted. In the same way, in the case of normal and neurotic people what is in question is not whether these complexes and conflicts *exist* but whether they have become pathogenic and, if so, by means of what mechanisms they have become so.

The essence of the theories about the 'actual neuroses' which I have put forward in the past and am defending to-day lies in my assertion, based on experiment, that their symptoms, unlike psychoneurotic ones, cannot be analysed. That is to say, the constipation, headaches and fatigue of the so-called neurasthenic do not admit of being traced back historically or symbolically to operative experiences and cannot be understood as substitutes for sexual satisfaction or as compromises between opposing instinctual impulses, as is the case with psycho-neurotic symptoms (even though the latter may perhaps have the same appearance). I do not believe it will be possible to upset this assertion by the help of psycho-analysis. On the other hand I will grant to-day what I was unable to believe formerly - that an analytic treatment can have an indirect curative effect on 'actual' symptoms. It can do so either by enabling the current noxae to be better tolerated, or by enabling the sick person to escape from the current noxae by making a change in his sexual régime. These would be desirable prospects from the point of view of our therapeutic interest.

If in the end I am convicted of being in error over the theoretical problem of the 'actual neuroses', I shall be able to console myself with the advance in our knowledge, which must disregard the opinions of an individual. You may then ask why, since I have such a laudable appreciation of the limitations of my own infallibility, I do not at once give in to these new suggestions but prefer to re-enact the familiar comedy of an old man obstinately clinging to his opinions. My reply is that I do not yet see any evidence to induce me to give in. In early days I made a number of alterations in my views and did not conceal them from the public. I was reproached on account of these changes, just as to-day I am reproached for my conservativeness. Not that I should be intimidated by the one reproach or the other. But I know that I have a destiny to fulfil. I cannot escape it and I need not move towards it. I shall await it, and in the meantime I shall behave towards our science as earlier experience has taught me.

I am loth to take up a position on the question that has been dealt with by you so extensively of the injuriousness of masturbation, for it offers no proper approach to the problems which concern us. But we must all do so, no doubt: the world seems to feel no other interest in masturbation. You will recall that at our former series of discussions on the subject we had among us as a visitor a distinguished Viennese paediatrician. What was it that he repeatedly asked us to tell him? Simply, how far masturbation is injurious and why it injures some people but not others. So we must force our researches to make a pronouncement to meet this practical demand.

I must confess that here again I am unable to share Stekel's point of view, in spite of the many courageous and correct comments that he has made to us on the question. As he sees it, the injuriousness of masturbation amounts to no more than a senseless prejudice which, purely as a result of personal limitations, we are unwilling to cast off with sufficient thoroughness. I believe, however, that if we fix our eyes on the problem *sine ira et studio*¹ - so far, of course, as we are able to, - we shall be obliged to declare, rather, that to take up such a position contradicts our fundamental views on the aetiology of the neuroses. Masturbation corresponds essentially to infantile sexual activity and to its subsequent retention at a more mature age. We derive the neuroses from a conflict between a person's sexual urges and his other (ego) trends. Now someone might say: 'In my view the pathogenic factor in this aetiological relation lies solely in the ego's reaction to its sexuality.' By this he would be asserting that anyone could keep free of neurosis if only he were willing to allow unrestricted satisfaction to his sexual urges. But it is clearly arbitrary, and evidently pointless as well, to come to such a decision, and not to allow the sexual urges themselves to have any share in the pathogenic process. But if you admit that the sexual urges can have a pathogenic effect, you should no longer deny a similar significance to masturbation, which after all only consists in carrying out such sexual instinctual impulses. In every case which seems to show that masturbation is pathogenic, you will, no doubt, be able to trace the operation further back - to the instincts which manifest themselves in the masturbation and to the resistances which are directed against those instincts. Masturbation is not anything ultimate - whether somatically or psychologically - it is not a real 'agent', but merely the name for certain activities. Yet, however much we may trace things further back, our judgement on the causation of the illness will nevertheless rightly remain attached to this activity. And do not forget that masturbation is not to be equated with sexual activity in general: it is sexual activity subjected to certain limiting conditions. Thus it also remains possible that it is precisely these peculiarities of masturbatory activity which are the vehicles of its pathogenic effects.

¹ ['Without bitterness or partiality.']

We are therefore brought back once more from arguments to clinical observation, and we are warned by it not to strike out the heading 'Injurious Effects of Masturbation'. We are at all events confronted in the neuroses with cases in which masturbation has done damage.

This damage seems to occur in three different ways:

(a) *Organic* injury may occur by some unknown mechanism. Here we must take into account the considerations of excess and of inadequate satisfaction, which have often been mentioned by you.

(b) The injury may occur through the laying down of a *psychical pattern* according to which there is no necessity for trying to alter the external world in order to satisfy a great need. Where, however, a far-reaching reaction against this pattern develops, the most valuable character-traits may be initiated.

(c) A *fixation of infantile sexual aims* may be made possible, and a persistence of psychical infantilism. Here we have the disposition for the occurrence of a neurosis. As psycho-analysts we cannot fail to be greatly interested in this result of masturbation - which in this case means, of course, masturbation occurring at puberty and continued afterwards. We must keep in mind the significance which masturbation acquires as a carrying into effect of phantasy - that half-way region interpolated between life in accordance with the pleasure principle and life in accordance with the reality principle; and we must remember how masturbation makes it possible to bring about sexual developments and sublimations in phantasy, which are nevertheless not advances but injurious compromises - though it is true, as an important remark of Stekel's has pointed out, that this same compromise renders severe perverse inclinations harmless and averts the worst consequences of abstinence.

On the basis of my medical experience, I cannot rule out a permanent reduction in potency as one among the results of masturbation, though I will grant to Stekel that in a number of cases it may turn out to be only apparent. This particular result of masturbation, however, cannot be classed unhesitatingly among the injurious ones. Some diminution of male potency and of the brutal aggressiveness involved in it is much to the purpose from the point of view of civilization. It facilitates the practice by civilized men of the virtues of sexual moderation and trustworthiness that are incumbent on them. Virtue accompanied by full potency is usually felt as a hard task.

This may strike you as cynical, but you may rest assured that it is not cynically meant. It sets out to be no more than a piece of dry description, without regard to whether it may cause satisfaction or annoyance. For masturbation, like so many other things, has *les défauts de ses vertus* and on the other hand *les vertus de ses défauts*. If one is disentangling an involved and complex subject with a one-sided practical interest in its harmfulness and uses, one must put up with unwelcome discoveries.

Furthermore, I think we may with advantage distinguish what we may describe as the *direct* injuries caused by masturbation from those which arise *indirectly* from the ego's resistance and indignation against that sexual activity. I have not entered into these latter consequences.

And now I am obliged to add a few words on the second of the two painful questions we have been asked. Assuming that masturbation can be injurious, under what conditions and in what people does it prove to be so?

Like the majority of you, I am inclined to refuse to give a general answer to the question. It partly coincides with another, more comprehensive question: when does sexual activity in general become pathogenic for particular people? If we put this consideration on one side, we are left with a question of detail relating to the characteristics of masturbation in so far as it represents a special manner and form of sexual satisfaction. Here it would be to the point to repeat what is already known to us and has been discussed in other connections - to assess the influence of the *quantitative* factor and of the combined operation of several pathogenic factors. Above all, however, we should have to leave a wide field for what are known as an individual's constitutional dispositions. But it must be confessed that dealing with these is an awkward business. For we are in the habit of forming our opinion of individual dispositions *ex post facto*: we attribute this or that disposition to people after the event, when they have already fallen ill. We have no method of discovering it beforehand. We behave, in fact, like the Scottish King in one of Victor Hugo's novels, who boasted of an infallible method of recognizing witchcraft. He had the accused woman stewed in boiling water and then tasted the broth. He then judged according to the taste: 'Yes, that was a witch', or 'No, that was not one.'

There is another question that I might draw your attention to, which has been dealt with too little in our discussions: that of 'unconscious' masturbation. I mean masturbation during sleep, during abnormal states, or fits. You will recall the many hysterical fits in which masturbatory acts recur in a disguised or unrecognizable way, after the subject has renounced that form of satisfaction, and the many symptoms in obsessional neurosis which seek to replace and repeat this kind of sexual activity, which has formerly been forbidden. We may also speak of a therapeutic return of masturbation. A number of you will have found on occasion, as I have, that it represents a great advance if during the treatment the patient ventures to take up masturbation once more, though he may have no intention of making a permanent stop at that infantile halting-place. In this connection I may remind you that a considerable number of precisely the most severe sufferers from neurosis have avoided all recollection of masturbation during historic times, while psycho-analysis is able to prove that that species of sexual activity had by no means been strange to them during the forgotten earliest period of their lives.

But I think the time has come to break off. For we are all agreed on one thing - that the subject of masturbation is quite inexhaustible.

A NOTE ON THE UNCONSCIOUS IN PSYCHO-ANALYSIS
(1912)

Intentionally left blank

A NOTE ON THE UNCONSCIOUS IN PSYCHO-ANALYSIS

I wish to expound in a few words and as plainly as possible what the term 'unconscious' has come to mean in Psycho-analysis and in Psycho-analysis alone.

A conception - or any other psychical element - which is now *present* to my consciousness may become *absent* the next moment, and may become *present again*, after an interval, unchanged, and, as we say, from memory, not as a result of a fresh perception by our senses. It is this fact which we are accustomed to account for by the supposition that during the interval the conception has been present in our mind, although *latent* in consciousness. In what shape it may have existed while present in the mind and latent in consciousness we have no means of guessing.

At this very point we may be prepared to meet with the philosophical objection that the latent conception did not exist as an object of psychology, but as a physical disposition for the recurrence of the same psychical phenomenon, i.e. of the said conception. But we may reply that this is a theory far overstepping the domain of psychology proper; that it simply begs the question by asserting 'conscious' to be an identical term with 'psychical', and that it is clearly at fault in denying psychology the right to account for its most common facts, such as memory, by its own means.

Now let us call 'conscious' the conception which is present to our consciousness and of which we are aware, and let this be the only meaning of the term 'conscious'. As for latent conceptions, if we have any reason to suppose that they exist in the mind - as we had in the case of memory - let them be denoted by the term 'unconscious'.

Thus an unconscious conception is one of which we are not aware, but the existence of which we are nevertheless ready to admit on account of other proofs or signs.

This might be considered an uninteresting piece of descriptive or classificatory work if no experience appealed to our judgement other than the facts of memory, or the cases of association by unconscious links. The well-known experiment, however, of the 'post-hypnotic suggestion' teaches us to insist upon the importance of the distinction between *conscious* and *unconscious* and seems to increase its value.

In this experiment, as performed by Bernheim, a person is put into a hypnotic state and is subsequently aroused. While he was in the hypnotic state, under the influence of the physician, he was ordered to execute a certain action at a certain fixed moment after his awakening, say half an hour later. He awakes, and seems fully conscious and in his ordinary condition; he has no recollection of his hypnotic state, and yet at the prearranged moment there rushes into his mind the impulse to do such and such a thing, and he does it consciously, though not knowing why. It seems impossible to give any other description of the phenomenon than to say that the order had been present in the mind of the person in a condition of latency, or had been present unconsciously, until the given moment came, and then had become conscious. But not the whole of it emerged into consciousness: only the conception of the act to be executed. All the other ideas associated with this conception - the order, the influence of the physician, the recollection of the hypnotic state, remained unconscious even then.

But we have more to learn from such an experiment. We are led from the purely descriptive to a *dynamic* view of the phenomenon. The idea of the action ordered in hypnosis not only became an object of consciousness at a certain moment, but the more striking aspect of the fact is that this idea grew *active*: it was translated into action as soon as consciousness became aware of its presence. The real stimulus to the action being the order of the physician, it is hard not to concede that the idea of the physician's order became active too. Yet this last idea did not reveal itself to consciousness, as did its outcome, the idea of the action; it remained unconscious, and so it was *active and unconscious* at the same time.

A post-hypnotic suggestion is a laboratory production, an artificial fact. But if we adopt the theory of hysterical phenomena first put forward by P. Janet and elaborated by Breuer and myself, we shall not be at a loss for plenty of natural facts showing the psychological character of the post-hypnotic suggestion even more clearly and distinctly.

The mind of the hysterical patient is full of active yet unconscious ideas; all her symptoms proceed from such ideas. It is in fact the most striking character of the hysterical mind to be ruled by them. If the hysterical woman vomits, she may do so from the idea of being pregnant. She has, however, no knowledge of this idea, although it can easily be detected in her mind, and made conscious to her, by one of the technical procedures of psycho-analysis. If she is executing the jerks and movements constituting her 'fit', she does not even consciously represent to herself the intended actions, and she may perceive those actions with the detached feelings of an onlooker. Nevertheless analysis will show that she was acting her part in the dramatic reproduction of some incident in her life, the memory of which was unconsciously active during the attack. The same preponderance of active unconscious ideas is revealed by analysis as the essential fact in the psychology of all other forms of neurosis.

We learn therefore by the analysis of neurotic phenomena that a latent or unconscious idea is not necessarily a weak one, and that the presence of such an idea in the mind admits of indirect proofs of the most cogent kind, which are equivalent to the direct proof furnished by consciousness. We feel justified in making our classification agree with this addition to our knowledge by introducing a fundamental distinction between different kinds of latent or unconscious ideas. We were accustomed to think that every latent idea was so because it was weak and that it grew conscious as soon as it became strong. We have not gained the conviction that there are some latent ideas which do not penetrate into consciousness, however strong they may have become. Therefore we may call the latent ideas of the first type *foreconscious*,¹ while we reserve the term *unconscious* (proper) for the latter type which we came to study in the neuroses. The term *unconscious*, which was used in the purely descriptive sense before, now comes to imply something more. It designates not only latent ideas in general, but especially ideas with a certain dynamic character, ideas keeping apart from consciousness in spite of their intensity and activity.

¹ [In the 1925 English version, throughout the paper, 'foreconscious' was altered to 'preconscious', which has, of course, become the regular translation of the German '*vorbewusst*'.]

Before continuing my exposition I will refer to two objections which are likely to be raised at this point. The first of these may be stated thus: instead of subscribing to the hypothesis of unconscious ideas of which we know nothing, we had better assume that consciousness can be split up, so that certain ideas or other psychical acts may constitute a consciousness apart; which has become detached and estranged from the bulk of conscious psychical activity. Well-known pathological cases like that of Dr. Azam seem to go far to show that the splitting up of consciousness is no fanciful imagination.

I venture to urge against this theory that it is a gratuitous assumption, based on the abuse of the word 'conscious'. We have no right to extend the meaning of this word so far as to make it include a consciousness of which its owner himself is not aware. If philosophers find difficulty in accepting the existence of unconscious ideas, the existence of an unconscious consciousness seems to me even more objectionable. The cases described as splitting of consciousness, like Dr. Azam's, might better be denoted as shifting of consciousness, - that function - or whatever it be - oscillating between two different psychical complexes which become conscious and unconscious in alternation.

The other objection that may probably be raised would be that we apply to normal psychology conclusions which are drawn chiefly from the study of pathological conditions. We are enabled to answer it by another fact, the knowledge of which we owe to psycho-analysis. Certain deficiencies of function of most frequent occurrence among healthy people, e.g. *lapsus linguae*, errors in memory and speech, forgetting of names, etc., may easily be shown to depend on the action of strong unconscious ideas in the same way as neurotic symptoms. We shall meet with another still more convincing argument at a later stage of this discussion.

By the differentiation of foreconscious and unconscious ideas, we are led on to leave the field of classification and to form an opinion about functional and dynamical relations in psychical action. We have found a *foreconscious activity* passing into consciousness with no difficulty, and an *unconscious activity* which remains so and seems to be cut off from consciousness.

Now we do not know whether these two modes of psychical activity are identical or essentially divergent from their beginning, but we may ask why they should become different in the course of psychical action. To this last question psycho-analysis gives a clear and unhesitating answer. It is by no means impossible for the product of unconscious activity to pierce into consciousness, but a certain amount of exertion is needed for this task. When we try to do it in ourselves, we become aware of a distinct feeling of *repulsion*¹ which must be overcome, and when we produce it in a patient we get the most unquestionable signs of what we call his *resistance* to it. So we learn that the unconscious idea is excluded from consciousness by living forces which oppose themselves to its reception, while they do not object to other ideas, the foreconscious ones. Psycho-analysis leaves no room for doubt that the repulsion from unconscious ideas is only provoked by the tendencies embodied in their contents. The next and most probable theory which can be formulated at this stage of our knowledge is the following. Unconsciousness is a regular and inevitable phase in the processes constituting our psychical activity; every psychical act begins as an unconscious one, and it may either remain so or go on developing into consciousness, according as it meets with resistance or not. The distinction between foreconscious and unconscious activity is not a primary one, but comes to be established after repulsion has sprung up. Only then the difference between foreconscious ideas, which can appear in consciousness and reappear at any moment, and unconscious ideas which cannot do so gains a theoretical as well as a practical value. A rough but not inadequate analogy to this supposed relation of conscious to unconscious activity might be drawn from the field of ordinary photography. The first stage of the photograph is the 'negative'; every photographic picture has to pass through the 'negative process', and some of these negatives which have held good in examination are admitted to the 'positive process' ending in the picture.

¹ [In the German translation the word 'repulsion', here and lower down, is rendered by '*Abwehr*', of which the usual English version is 'defence' or 'fending off'.]

But the distinction between foreconscious and unconscious activity, and the recognition of the barrier which keeps them asunder, is not the last or the most important result of the psycho-analytic investigation of psychical life. There is one psychical product to be met with in the most normal persons, which yet presents a very striking analogy to the wildest productions of insanity, and was no more intelligible to philosophers than insanity itself. I refer to dreams. Psycho-analysis is founded upon the analysis of dreams; the interpretation of dreams is the most complete piece of work the young science has done up to the present. One of the most common types of dream-formation may be described as follows: a train of thoughts has been aroused by the working of the mind in the daytime, and retained some of its activity, escaping from the general inhibition of interests which introduces sleep and constitutes the psychical preparation for sleeping. During the night this train of thoughts succeeds in finding connections with one of the unconscious tendencies present ever since his childhood in the mind of the dreamer, but ordinarily *repressed* and excluded from his conscious life. By the borrowed force of this unconscious help, the thoughts, the residue of the day's work,¹ now become active again, and emerge into consciousness in the shape of the dream. Now three things have happened:

- (1) The thoughts have undergone a change, a disguise and a distortion, which represents the part of the unconscious helpmate.
- (2) The thoughts have occupied consciousness at a time when they ought not.
- (3) Some part of the unconscious, which could not otherwise have done so, has emerged into consciousness.

We have learnt the art of finding out the 'residual thoughts', the *latent thoughts of the dream*, and, by comparing them with the apparent² *dream*, we are able to form a judgement on the changes they underwent and the manner in which these were brought about.

The latent thoughts of the dream differ in no respect from the products of our regular conscious activity; they deserve the name of foreconscious thoughts, and may indeed have been conscious at some moment of waking life. But by entering into connection with the unconscious tendencies during the night they have become assimilated to the latter, degraded as it were to the condition of unconscious thoughts, and subjected to the laws by which unconscious activity is governed. And here is the opportunity to learn what we could not have guessed from speculation, or from another source of empirical information - that the laws of unconscious activity differ widely from those of the conscious. We gather in detail what the peculiarities of the *Unconscious* are, and we may hope to learn still more about them by a profounder investigation of the processes of dream-formation.

¹ [In the 1925 English version the word 'mental' was inserted before 'work'. In the German translation the whole phrase is rendered '*Tagesreste*', for which the usual English equivalent is 'day's residues'.]

² [This word was altered to 'manifest' in the 1925 English version.]

This inquiry is not yet half finished, and an exposition of the results obtained hitherto is scarcely possible without entering into the most intricate problems of dream-analysis. But I would not break off this discussion without indicating the change and progress in our comprehension of the Unconscious which are due to our psycho-analytic study of dreams.

Unconsciousness seemed to us at first only an enigmatical characteristic of a definite psychical act. Now it means more for us. It is a sign that this act partakes of the nature of a certain psychical category known to us by other and more important characters¹ and that it belongs to a system of psychical activity which is deserving of our fullest attention. The index-value of the unconscious has far outgrown its importance as a property. The system revealed by the sign that the single acts forming parts of it are unconscious we designate by the name 'The Unconscious', for want of a better and less ambiguous term. In German, I propose to denote this system by the letters *Ubw*, an abbreviation of the German word 'Unbewusst'.² And this is the third and most significant sense which the term 'unconscious' has acquired in psycho-analysis.

¹ [This was altered to 'features' in the 1925 English version.]

² [Equivalent English abbreviation: 'Ucs'.]

AN EVIDENTIAL DREAM
(1913)

Intentionally left blank

AN EVIDENTIAL DREAM

A lady suffering from doubting mania and obsessive ceremonials insisted that her nurses should never let her out of their sight for a single moment: otherwise she would begin to brood about forbidden actions that she might have committed while she was not being watched. One evening, while she was resting on the sofa, she thought she saw that the nurse on duty had fallen asleep. She called out: 'Did you see me?' The nurse started up and replied: 'Of course I did.' This gave the patient grounds for a fresh doubt, and after a time she repeated her question, which the nurse met with renewed protestations; just at that moment another attendant came in bringing the patient's supper.

This incident occurred one Friday evening. Next morning the nurse recounted a dream which had the effect of dispelling the patient's doubts.

DREAM. - Someone had entrusted a child to her. Its mother had left home, and she had lost it. As she went along, she enquired from the people in the street whether they had seen the child. Then she came to a large expanse of water and crossed a narrow footbridge. (There was an addendum: Suddenly there appeared before her on the footbridge, like a "fata Morgana", the figure of another nurse.) Then she found herself in a familiar place, where she met a woman whom she had known as a girl and who had in those days been a saleswoman in a provision shop and later had got married. She asked the woman, who was standing in front of her door: 'Did you see the child?' The woman paid no attention to the question but informed her that she was now divorced from her husband, adding that marriage is not always happy either. She woke up feeling reassured and thought that the child would turn up all right in a neighbour's house.

ANALYSIS. - The patient assumed that this dream referred to the falling asleep which the nurse had denied. From additional information volunteered by the latter, she was able to interpret the dream in a fashion which, although incomplete in some respects, was sufficient for all practical purposes. I myself heard only the lady's report and did not interview the nurse. I shall first quote the patient's interpretation, and then supplement it with whatever our general understanding of the laws governing dream-formation allows us to add.

'The nurse told me that the child in the dream reminded her of a case the nursing of which had given her the most lively satisfaction. It was that of a child who was unable to see on account of inflammation of the eyes (blennorrhoea). The mother, however, did not leave home: she helped to nurse the child. On the other hand I remember too that when my husband, who thinks highly of this nurse, went away, he left me in her care and she promised to look after me as she would after a child.'

Furthermore, we know from the patient's analysis that by insisting on never being let out of sight she had put herself back in the position of being a child once more.

'Her having lost the child', continued the patient, 'signified that she had not seen me; she had lost sight of me. This was her admission that she had actually gone to sleep for a time and had not told me the truth afterwards.'

She was in the dark about the meaning of the small piece of the dream in which the nurse enquired from the people in the street whether they had seen the child; on the other hand, she was able to elucidate the later details of the manifest dream.

'The large expanse of water made the nurse think of the Rhine; she added, however, that it was much larger than the Rhine. Then she remembered that on the previous evening I had read her the story of Jonah and the whale, and had told her that I myself once saw a whale in the English Channel. I fancy that the large expanse of water was the sea and was an allusion to the story of Jonah.

'I think, too, the narrow footbridge came from the same story, which was amusingly written in dialect. The anecdote related how a religious instructor described to his pupils the wonderful adventures of Jonah; whereupon a boy objected that it could not be true, since the teacher himself had told them before that whales could swallow only the smallest creatures owing to the narrowness of their gullets. The teacher got out of the difficulty by saying that Jonah was a Jew, and that Jews would squeeze in anywhere. My nurse is very pious but inclined to religious doubts, and I reproached myself in case what I had read to her might have stirred them up.

'On this narrow footbridge she now saw the apparition of another nurse, whom she knew. She told me the story of this nurse: she had drowned herself in the Rhine because she had been discharged from a case owing to something she had been guilty of.¹ She herself had feared, therefore, that she would be discharged for having fallen asleep. Moreover, on the day following the incident and after relating the dream, the nurse cried bitterly, and when I asked her why, replied quite rudely: "You know why as well as I do; and now you won't trust me any more!"'

Since the apparition of the drowned nurse was an addendum and an especially distinct one, we would have advised the lady to begin her dream-interpretation at that point. According to the dreamer's report, too, this first half of her dream was accompanied by acute anxiety; the second part paved the way for the feeling of reassurance with which she awoke.

'I regard the next part of the dream', said the lady, continuing her analysis, 'as certain corroboration of my view that the dream had to do with what happened on Friday evening, for the person who had formerly been a saleswoman in a provision shop can only have referred to the attendant who brought in the supper on that occasion. I noticed, too, that the nurse had complained of nausea all day long. The question she put to this woman: "Did you see the child?" is obviously traceable to my question: "Did you see me!" which I had put to her for the second time just as the attendant came in with the dishes.'

¹ At this point I have been guilty of making a condensation of the material, which I have been able to put right after going through my draft with the lady who told me the story. The nurse who met the dreamer as an apparition on the footbridge had not been guilty of anything in her nursing. She was discharged because the child's mother, who had to leave home at the time, wanted to leave her child in charge of an older attendant - thus in point of fact a more trustworthy one. This was followed by a second story about another nurse who had actually been discharged on account of neglect, but who did not on that account drown herself. The material necessary for the interpretation of the dream-element came, as is so often the way, from two sources. My memory carried out the synthesis that led to the interpretation. For the rest, this story of the drowned nurse contains the factor of the mother leaving home, which the lady connected with the departure of her husband. We thus have here an overdetermination which detracts somewhat from the elegance of the interpretation.

In the dream, too, enquiry after the child was made on two occasions. The fact that the woman did not reply - paid no attention - we may regard as a depreciation of this other attendant made in the dreamer's favour: she represented herself in the dream as being superior to the other woman, precisely because she herself had to face reproaches on account of her own lack of attention.

'The woman who appeared in the dream was not in actual fact divorced from her husband. The situation was taken from an incident in the life of the other attendant, who had been separated - "divorced" - from a man by her parents' command. The remark that "marriage does not always run smoothly either" was probably a consolation used in the course of conversation between the two women. This consolation prefigured another, with which the dream ended: "The child will turn up all right."

'I concluded from this dream that on the evening in question the nurse really did fall asleep and that she was afraid of being dismissed on that account. Because of this I no longer felt any doubt about the correctness of my observation. Incidentally, after relating the dream, she added that she was very sorry she had not got a dream-book with her. To my comment that such books were full of the most ignorant superstitions, she replied that, although she was not at all superstitious, still all the unpleasant happenings of her life had taken place on a Friday. I must add that at the present time her treatment of me is not at all satisfactory, and she is touchy and irritable and makes scenes about nothing.'

I think we must credit the lady with having correctly interpreted and evaluated her nurse's dream. As so often happens with dream-interpretation during analysis, the translation of the dream does not depend solely on the products of association, but we have also to take into account the circumstances of its narration, the behaviour of the dreamer before and after the analysis of the dream, as well as every remark or disclosure made by the dreamer at about the same time - during the same analytic session. If we take into consideration the nurse's touchiness, her attitude to unlucky Fridays, etc., we shall confirm the conclusion that the dream contained an admission that, in spite of her denial, she had actually dozed off, and was afraid she would be sent away from the 'child' in her care.¹

¹ A few days later, indeed, the nurse confessed to a third person that she had fallen asleep that evening, and thus confirmed the lady's interpretation.

While, however, for the lady who reported it to me this dream had practical significance, for us it stimulates theoretical interest in two directions. It is true that it ended in a consolation, but in the main it represented an important *admission* in regard to the nurse's relation to her patient. How does it come about that a dream, which is supposed, after all, to serve as the fulfilment of a wish, could take the place of an admission which was not even of any advantage to the dreamer? Must we really concede that in addition to wishful (and anxiety) dreams, there are also dreams of admission, as well as of warning, reflection, adaptation, and so on?

I must confess that I still do not quite understand why the stand I took against any such temptation in my *Interpretation of Dreams* has given rise to misgivings in the minds of so many psycho-analysts, among them some well-known ones. It seems to me that the differentiation between dreams of wishing, admission, warning, adaptation, and so on, has not much more sense than the differentiation, which is accepted perforce, of medical specialists into gynaecologists, paediatricians, and dentists. Let me recapitulate here as briefly as possible what I have said on this question in my *Interpretation of Dreams*.¹

The so-called 'day's residues' can act as disturbers of sleep and constructors of dreams; they are affectively cathected thought-processes from the dream-day, which have resisted the general lowering through sleep. These day's residues are uncovered by tracing back the manifest dream to the latent dream-thoughts; they constitute portions of the latter and are thus among the activities of waking life - whether conscious or unconscious - which have been able to persist into the period of sleep. In accordance with the multiplicity of thought-processes in the conscious and preconscious, these day's residues have the most numerous and varied meanings: they may be wishes or fears that have not been disposed of, or intentions, reflections, warnings, attempts at adaptation to current tasks, and so on. To this extent the classification of dreams that is under consideration seems to be justified by the content which is uncovered by interpretation. These day's residues, however, are not the dream itself: they lack the main essential of a dream. Of themselves they are not able to construct a dream. They are, strictly speaking, only the psychological material for the dream-work, just as sensory and somatic stimuli, whether accidental or produced under experimental conditions, constitute the *somatic* material for the dream-work. To attribute to them the main part in the construction of dreams is simply to repeat at a new point the pre-analytic error which explained dreams by referring them to bad digestion or to pressure on the skin. Scientific errors, indeed, are tenacious of life, and even when they have been refuted are ready to creep in again under new disguises.

¹ p. 992 ff.

The present state of our knowledge leads us to conclude that the essential factor in the construction of dreams is an unconscious wish - as a rule an infantile wish, now repressed - which can come to expression in this somatic or psychical material (in the day's residues too, therefore) and can thus supply these with a force which enables them to press their way through to consciousness even during the suspension of thought at night. The dream is in every case a fulfilment of *this* unconscious wish, whatever else it may contain - warning, reflection, admission, or any other part of the rich content of preconscious waking life that has persisted undealt-with into the night. It is *this* unconscious wish that gives the dream-work its peculiar character as an unconscious revision of preconscious material. A psycho-analyst can characterize as dreams only the products of the dream-work: in spite of the fact that the latent dream-thoughts are only arrived at from the interpretation of the dream, he cannot reckon them as part of the dream, but only as part of preconscious reflection. (Secondary revision by the conscious agency is here reckoned as part of the dream-work. Even if one were to separate it, this would not involve any alteration in our conception. We should then have to say: dreams in the analytic sense comprise the dream-work proper together with the secondary revision of its products.) The conclusion to be drawn from these considerations is that one cannot put the wish-fulfilling character of dreams on a par with their character as warnings, admissions, attempts at solution, etc., without denying the concept of a psychical dimension of depth - that is to say, without denying the standpoint of psycho-analysis.

Let us now go back to the nurse's dream, in order to demonstrate the quality of depth in the wish-fulfilment contained in it. We already know that the lady's interpretation of the dream was by no means complete; there were portions of it to which she was unable to do justice. Moreover she suffered from an obsessional neurosis, a condition which, from what I have observed, makes it considerably harder to understand dream-symbols, just as dementia praecox makes it easier.

Nevertheless, our knowledge of dream-symbolism enables us to understand uninterpreted portions of this dream and to discover a deeper significance behind the interpretations already given. We cannot but notice that some of the material employed by the nurse came from the complex of giving birth, of having children. The expanse of water (the Rhine, the Channel where the whale was seen) was certainly the water out of which children come. And then, too, she came to the water in search of a child. The Jonah legend, which was a factor lying behind the determination of this water, the question how Jonah (the child) could get through such a narrow passage, belongs to the same complex. And the nurse who threw herself into the Rhine out of mortification found a sexual-symbolic consolation for her despair of life in the mode of her death - by going into water. The narrow footbridge on which the apparition met her was in all probability also a genital symbol, although I must admit that here we lack as yet more precise knowledge.

The wish 'I want to have a child' seems therefore to have been the dream-constructor from the unconscious; no other would have been better calculated to console the nurse for the distressing state of affairs in real life. 'I shall be discharged: I shall lose the child in my care. What does it matter? I shall get a real child of my own instead.' The uninterpreted portion of the dream in which she questioned everyone in the street about the child may perhaps belong here; the interpretation would then run: 'And even if I have to offer myself on the streets I know how to get a child for myself.' A strain of defiance in the dreamer, hitherto disguised, suddenly declares itself at this point. Her admission fits in here for the first time: 'I have shut my eyes and compromised my professional reputation for conscientiousness; now I shall lose my place. Shall I be such a fool as to drown myself like Nurse X? Not I: I'll give up nursing altogether and get married; I'll be a woman and have a real child; nothing shall prevent me.' This interpretation is justified by the consideration that 'having children' is really the infantile expression of a wish for sexual intercourse: indeed it can be chosen in consciousness as a euphemistic expression of this objectionable wish.

Thus the dreamer's disadvantageous admission, to which she showed some inclination even in waking life, was made possible in the dream by being employed by a latent character-trait of hers for the purpose of bringing about the fulfilment of an infantile wish. We may surmise that this trait had a close connection - in regard both to time and to content - with the wish for a child and for sexual enjoyment.

Subsequent enquiry from the lady to whom I owe the first part of this interpretation afforded some unexpected information about the nurse's previous life. Before she took up nursing she had wanted to marry a man who had been keenly interested in her; but she had abandoned the projected marriage on account of the opposition of an aunt, towards whom her relations were a curious mixture of dependence and defiance. This aunt who prevented the marriage was the Superior of a nursing Order. The dreamer always regarded her as her pattern. She had expectations of an inheritance from her and was tied to her for that reason. Nevertheless, she opposed her aunt by not entering the Order as that lady had planned. The defiance shown in the dream was therefore directed against the aunt. We have ascribed an anal-erotic origin to this character-trait, and may take into consideration that the interests which made her dependent on her aunt were of a financial nature; we are also reminded that children favour the anal theory of birth.

This factor of infantile defiance may perhaps allow us to assume a closer relation between the first and last scenes in the dream. The former saleswoman in a provision shop represents in the dream the attendant who brought the lady's supper into the room just when she was asking the question 'Did you see me?' It appears, however, that she was cast for the role of hostile rival in general. The dreamer disparaged her capacities as a nurse by making her take not the slightest interest in the lost child, but deal only with her own private affairs in her answer. She had thus displaced on to this figure the indifference about the child in her care which she was beginning to feel. The unhappy marriage and divorce which she herself must have dreaded in her most secret wishes were attributed to the other woman. We know, however, that it was the aunt who had separated the dreamer from her fiancé. Hence the 'provision saleswoman' (a figure not necessarily without an infantile symbolic significance) may represent the aunt-Superior, who was in fact not much older than the dreamer and who had played the traditional part of mother-rival in her life. A satisfactory confirmation of this interpretation is to be found in the fact that the 'familiar' place where she came upon this person standing in front of her door was precisely the place where her aunt resided as a Superior.

Owing to the lack of contact between the analyst and the person under analysis, it is scarcely advisable to penetrate deeper into the structure of the dream. But we may perhaps say that so far as it was accessible to interpretation it has provided us with plenty of confirmations as well as with plenty of new problems.

THE OCCURRENCE IN DREAMS OF MATERIAL FROM FAIRY TALES
(1913)

Intentionally left blank

THE OCCURRENCE IN DREAMS OF MATERIAL FROM FAIRY TALES

It is not surprising to find that psycho-analysis confirms our recognition of the important place which folk fairy tales have acquired in the mental life of our children. In a few people a recollection of their favourite fairy tales takes the place of memories of their own childhood; they have made the fairy tales into screen memories.

Elements and situations derived from fairy tales are also frequently to be found in dreams. In interpreting the passages in question the patient will produce the significant fairy tale as an association. In the present paper I shall give two instances of this very common occurrence. But it will not be possible to do more than hint at the relations between the fairy tales and the history of the dreamer's childhood and his neurosis, though this limitation will involve the risk of breaking links which were of the utmost importance to the analyst.

I

Here is a dream of a young married woman who had had a visit from her husband a few days before: *She was in a room that was entirely brown. A little door led to the top of a steep staircase, and up this staircase there came into the room a curious manikin - small, with white hair, a bald top to his head and a red nose. He danced round the room in front of her, carried on in the funniest way, and then went down the staircase again. He was dressed in a grey garment, through which every part of his figure was visible. (A correction was made subsequently: He was wearing a long black coat and grey trousers.)*

The analysis was as follows. The description of the manikin's personal appearance fitted the dreamer's father-in-law without any alteration being necessary.¹ Immediately afterwards, however, she thought of the story of 'Rumpelstiltskin', who danced around in the same funny way as the man in the dream and in so doing betrayed his name to the queen; but by that he lost his claim to the queen's first child, and in his fury tore himself in two.

¹ Except for the detail that the manikin had his hair cut short, whereas her father-in-law wore his long.

On the day before she had the dream she herself had been just as furious with her husband and had exclaimed: 'I could tear him in two.'

The brown room at first gave rise to difficulties. All that occurred to her was her parents' dining-room, which was panelled in that colour - in brown wood. She then told some stories of beds which were so uncomfortable for two people to sleep in. A few days before, when the subject of conversation had been beds in other countries, she had said something very *mal à propos* - quite innocently, as she maintained - and everyone in the room had roared with laughter.

The dream was now already intelligible. The brown wood room¹ was in the first place a bed, and through the connection with the dining-room it was a marriage bed.² She was therefore in her marriage bed. Her visitor should have been her young husband, who, after an absence of several months, had visited her to play his part in the double bed. But to begin with it was her husband's father, her father-in-law.

Behind this first interpretation we have a glimpse of deeper and purely sexual material. Here the room was the vagina. (The room was in her - this was reversed in the dream.) The little man who made grimaces and behaved so funnily was the penis. The narrow door and the steep stairs confirmed the view that the situation was a representation of intercourse. As a rule we are accustomed to find the penis symbolized by a child; but we shall find there was good reason for a father being introduced to represent the penis in this instance.

The solution of the remaining portion of the dream will entirely confirm us in this interpretation. The dreamer herself explained the transparent grey garment as a condom. We may gather that considerations of preventing conception and worries whether this visit of her husband's might not have sown the seed of a second child were among the instigating causes of the dream.

¹ Wood, as is well known, is frequently a female or maternal symbol: e.g. *materia*, *Madeira*, etc.

² For bed and board stand for marriage.

The black coat. Coats of that kind suited her husband admirably. She wanted to persuade him always to wear them, instead of his usual clothes. Dressed in the black coat, therefore, her husband was as she liked to see him. *The black coat and grey trousers.* At two different levels, one above the other, this had the same meaning: 'I should like you to be dressed like that. I like you like that.'

Rumpelstiltskin was connected with the contemporary thoughts underlying the dream - the day's residues - by a neat antithetic relation. In the fairy tale he comes in order to take away the queen's first child. In the dream the little man comes in the shape of a father, because he had presumably brought a second child. But Rumpelstiltskin also gave access to the deeper, infantile stratum of the dream-thoughts. The droll little fellow, whose very name is unknown, whose secret is so eagerly canvassed, who can perform such extraordinary tricks - in the fairy tale he turns straw into gold - the fury against him, or rather against his possessor, who is envied for possessing him (the girl's envy for the penis) - all of these were elements whose relation to the foundations of the patient's neurosis can, as I have said, barely be touched upon in this paper. The short-cut hair of the manikin in the dream was no doubt also connected with the subject of castration.

If we carefully observe from clear instances the way in which dreamers use fairy tales and the point at which they bring them in, we may perhaps also succeed in picking up some hints which will help in interpreting remaining obscurities in the fairy tales themselves.

II

A young man told me the following dream. He had a chronological basis for his early memories in the circumstance that his parents moved from one country estate to another just before he was five years old; the dream, which he said was his earliest one, occurred while he was still upon the first estate.

'I dreamt that it was night and that I was lying in my bed. (My bed stood with its foot towards the window: in front of the window there was a row of old walnut trees. I know it was winter when I had the dream, and night-time.) Suddenly the window opened of its own accord, and I was terrified to see that some white wolves were sitting on the big walnut tree in front of the window. There were six or seven of them. The wolves were quite white, and looked more like foxes or sheep-dogs, for they had big tails like foxes and they had their ears pricked like dogs when they pay attention to something. In great horror, evidently of being eaten up by the wolves, I screamed and woke up. My nurse hurried to my bed, to see what had happened to me. It took quite a long while before I was convinced that it had only been a dream; I had had such a clear and life-like picture of the window opening and the wolves sitting on the tree. At last I grew quieter, felt as though I had escaped from some danger, and went to sleep again.

'The only piece of action in the dream was the opening of the window; for the wolves sat quite still and without making any movement on the branches of the tree, to the right and left of the trunk, and looked at me. It seemed as though they had riveted their whole attention upon me. - I think this was my first anxiety-dream. I was three, four, or at most five years old at the time. From then until my eleventh or twelfth year I was always afraid of seeing something terrible in my dreams.'

He added a drawing of the tree with the wolves, which confirmed his description. The analysis of the dream brought the following material to light.

He had always connected this dream with the recollection that during these years of his childhood he was most tremendously afraid of the picture of a wolf in a book of fairy tales. His elder sister, who was very much his superior, used to tease him by holding up this particular picture in front of him on some excuse or other, so that he was terrified and began to scream. In this picture the wolf was standing upright, striding out with one foot, with its claws stretched out and its ears pricked. He thought this picture must have been an illustration to the story of 'Little Red Riding-Hood'.

Why were the wolves white? This made him think of the sheep, large flocks of which were kept in the neighbourhood of the estate. His father occasionally took him with him to visit these flocks, and every time this happened he felt very proud and blissful. Later on - according to enquiries that were made it may easily have been shortly before the time of the dream - an epidemic broke out among the sheep. His father sent for a follower of Pasteur's, who inoculated the animals, but after the inoculation even more of them died than before.

How did the wolves come to be on the tree? This reminded him of a story that he had heard his grandfather tell. He could not remember whether it was before or after the dream, but its subject is a decisive argument in favour of the former view. The story ran as follows. A tailor was sitting at work in his room, when the window opened and a wolf leapt in. The tailor hit after him with his yard - no (he corrected himself), caught him by his tail and pulled it off, so that the wolf ran away in terror. Some time later the tailor went into the forest, and suddenly saw a pack of wolves coming towards him; so he climbed up a tree to escape from them. At first the wolves were in perplexity; but the maimed one, which was among them and wanted to revenge himself on the tailor, proposed that they should climb one upon another till the last one could reach him. He himself - he was a vigorous old fellow - would be the base of the pyramid. The wolves did as he suggested, but the tailor had recognized the visitor whom he had punished, and suddenly called out as he had before: 'Catch the grey one by his tail!' The tailless wolf, terrified by the recollection, ran away, and all the others tumbled down.

In this story the tree appears, upon which the wolves were sitting in the dream. But it also contains an unmistakable allusion to the castration complex. The *old* wolf was docked of his tail by the tailor. The fox-tails of the wolves in the dream were probably compensations for this taillessness.

Why were there six or seven wolves? There seemed to be no answer to this question, until I raised a doubt whether the picture that had frightened him could be connected with the story of 'Little Red Riding-Hood'. This fairy tale only offers an opportunity for two illustrations - Little Red Riding-Hood's meeting with the wolf in the wood, and the scene in which the wolf lies in bed in the grandmother's night-cap. There must therefore be some other fairy tale behind his recollection of the picture. He soon discovered that it could only be the story of 'The Wolf and the Seven Little Goats'. Here the number seven occurs, and also the number six, for the wolf only ate up six of the little goats, while the seventh hid itself in the clock-case. The white, too, comes into this story, for the wolf had his paw made white at the baker's after the little goats had recognized him on his first visit by his grey paw. Moreover, the two fairy tales have much in common. In both there is the eating up, the cutting open of the belly, the taking out of the people who have been eaten and their replacement by heavy stones, and finally in both of them the wicked wolf perishes. Besides all this, in the story of the little goats the tree appears. The wolf lay down under a tree after his meal and snored.

I shall have, for a special reason, to deal with this dream again elsewhere, and interpret it and consider its significance in greater detail. For it is the earliest anxiety-dream that the dreamer remembered from his childhood, and its content, taken in connection with other dreams that followed it soon afterwards and with certain events in his earliest years, is of quite peculiar interest. We must confine ourselves here to the relation of the dream to the two fairy tales which have so much in common with each other, 'Little Red Riding-Hood' and 'The Wolf and the Seven Little Goats'. The effect produced by these stories was shown in the little dreamer by a regular animal phobia. This phobia was only distinguished from other similar cases by the fact that the anxiety-animal was not an object easily accessible to observation (such as a horse or a dog), but was known to him only from stories and picture-books.

I shall discuss on another occasion the explanation of these animal phobias and the significance attaching to them. I will only remark in anticipation that this explanation is in complete harmony with the principal characteristic shown by the neurosis from which the present dreamer suffered later in his life. His fear of his father was the strongest motive for his falling ill, and his ambivalent attitude towards every father-surrogate was the dominating feature of his life as well as of his behaviour during the treatment.

If in my patient's case the wolf was merely a first father-surrogate, the question arises whether the hidden content in the fairy tales of the wolf that ate up the little goats and of 'Little Red Riding-Hood' may not simply be infantile fear of the father.¹ Moreover, my patient's father had the characteristic, shown by so many people in relation to their children, of indulging in 'affectionate abuse'; and it is possible that during the patient's earlier years his father (though he grew severe later on) may more than once, as he caressed the little boy or played with him, have threatened in fun to 'gobble him up'. One of my patients told me that her two children could never get to be fond of their grandfather, because in the course of his affectionate romping with them he used to frighten them by saying he would cut open their tummies.

¹ Compare the similarity between these two fairy tales and the myth of Kronos, which has been pointed out by Rank (1912).

THE THEME OF THE THREE CASKETS
(1913)

Intentionally left blank

THE THEME OF THE THREE CASKETS

I

Two scenes from Shakespeare, one from a comedy and the other from a tragedy, have lately given me occasion for posing and solving a small problem.

The first of these scenes is the suitors' choice between the three caskets in *The Merchant of Venice*. The fair and wise Portia is bound at her father's bidding to take as her husband only that one of her suitors who chooses the right casket from among the three before him. The three caskets are of gold, silver and lead: the right casket is the one that contains her portrait. Two suitors have already departed unsuccessful: they have chosen gold and silver. Bassanio, the third, decides in favour of lead; thereby he wins the bride, whose affection was already his before the trial of fortune. Each of the suitors gives reasons for his choice in a speech in which he praises the metal he prefers and depreciates the other two. The most difficult task thus falls to the share of the fortunate third suitor; what he finds to say in glorification of lead as against gold and silver is little and has a forced ring. If in psycho-analytic practice we were confronted with such a speech, we should suspect that there were concealed motives behind the unsatisfying reasons produced.

Shakespeare did not himself invent this oracle of the choice of a casket; he took it from a tale in the *Gesta Romanorum*, in which a girl has to make the same choice to win the Emperor's son.¹ Here too the third metal, lead, is the bringer of fortune. It is not hard to guess that we have here an ancient theme, which requires to be interpreted, accounted for and traced back to its origin. A first conjecture as to the meaning of this choice between gold, silver and lead is quickly confirmed by a statement of Stucken's,² who has made a study of the same material over a wide field. He writes: 'The identity of Portia's three suitors is clear from their choice: the Prince of Morocco chooses the gold casket - he is the sun; the Prince of Arragon chooses the silver casket - he is the moon; Bassanio chooses the leaden casket - he is the star youth.' In support of this explanation he cites an episode from the Estonian folk-epic 'Kalewipoeg', in which the three suitors appear undisguisedly as the sun, moon and star youths (the last being 'the Pole-star's eldest boy') and once again the bride falls to the lot of the third.

¹ Brandes (1896).

² Stucken (1907, 655).

Thus our little problem has led us to an astral myth! The only pity is that with this explanation we are not at the end of the matter. The question is not exhausted, for we do not share the belief of some investigators that myths were read in the heavens and brought down to earth; we are more inclined to judge with Otto Rank¹ that they were projected on to the heavens after having arisen elsewhere under purely human conditions. It is in this human content that our interest lies.

Let us look once more at our material. In the Estonian epic, just as in the tale from the *Gesta Romanorum*, the subject is a girl choosing between three suitors; in the scene from *The Merchant of Venice* the subject is apparently the same, but at the same time something appears in it that is in the nature of an inversion of the theme: a *man* chooses between three - caskets. If what we were concerned with were a dream, it would occur to us at once that caskets are also women, symbols of what is essential in woman, and therefore of a woman herself - like coffers, boxes, cases, baskets, and so on. If we boldly assume that there are symbolic substitutions of the same kind in myths as well, then the casket scene in *The Merchant of Venice* really becomes the inversion we suspected. With a wave of the wand, as though we were in a fairy tale, we have stripped the astral garment from our theme; and now we see that the theme is a human one, *a man's choice between three women*.

This same content, however, is to be found in another scene of Shakespeare's, in one of his most powerfully moving dramas; not the choice of a bride this time, yet linked by many hidden similarities to the choice of the casket in *The Merchant of Venice*. The old King Lear resolves to divide his kingdom while he is still alive among his three daughters, in proportion to the amount of love that each of them expresses for him. The two elder ones, Goneril and Regan, exhaust themselves in asseverations and laudations of their love for him; the third, Cordelia, refuses to do so. He should have recognized the unassuming, speechless love of his third daughter and rewarded it, but he does not recognize it. He disowns Cordelia, and divides the kingdom between the other two, to his own and the general ruin. Is not this once more the scene of a choice between three women, of whom the youngest is the best, the most excellent one?

¹ Rank (1909, 8 ff.).

There will at once occur to us other scenes from myths, fairy tales and literature, with the same situation as their content. The shepherd Paris has to choose between three goddesses, of whom he declares the third to be the most beautiful. Cinderella, again, is a youngest daughter, who is preferred by the prince to her two elder sisters. Psyche, in Apuleius's story, is the youngest and fairest of three sisters. Psyche is, on the one hand, revered as Aphrodite in human form; on the other, she is treated by that goddess as Cinderella was treated by her stepmother and is set the task of sorting a heap of mixed seeds, which she accomplishes with the help of small creatures (doves in the case of Cinderella, ants in the case of Psyche).¹ Anyone who cared to make a wider survey of the material would undoubtedly discover other versions of the same theme preserving the same essential features.

Let us be content with Cordelia, Aphrodite, Cinderella and Psyche. In all the stories the three women, of whom the third is the most excellent one, must surely be regarded as in some way alike if they are represented as sisters. (We must not be led astray by the fact that Lear's choice is between three *daughters*; this may mean nothing more than that he has to be represented as an old man. An old man cannot very well choose between three women in any other way. Thus they become his daughters.)

But who are these three sisters and why must the choice fall on the third? If we could answer this question, we should be in possession of the interpretation we are seeking. We have once already made use of an application of psycho-analytic technique, when we explained the three caskets symbolically as three women. If we have the courage to proceed in the same way, we shall be setting foot on a path which will lead us first to something unexpected and incomprehensible, but which will perhaps, by a devious route, bring us to a goal.

¹ I have to thank Dr. Otto Rank for calling my attention to these similarities.

It must strike us that this excellent third woman has in several instances certain peculiar qualities besides her beauty. They are qualities that seem to be tending towards some kind of unity; we must certainly not expect to find them equally well marked in every example. Cordelia makes herself unrecognizable, in conspicuous like lead, she remains dumb, she 'loves and is silent'. Cinderella hides so that she cannot be found. We may perhaps be allowed to equate concealment and dumbness. These would of course be only two instances out of the five we have picked out. But there is an intimation of the same thing to be found, curiously enough, in two other cases. We have decided to compare Cordelia, with her obstinate refusal, to lead. In Bassanio's short speech while he is choosing the casket, he says of lead (without in any way leading up to the remark):

'Thy paleness¹ moves me more than eloquence.'

That is to say: 'Thy plainness moves me more than the blatant nature of the other two.' Gold and silver are 'loud'; lead is dumb - in fact like Cordelia, who 'loves and is silent'.²

In the ancient Greek accounts of the Judgement of Paris, nothing is said of any such reticence on the part of Aphrodite. Each of the three goddesses speaks to the youth and tries to win him by promises. But, oddly enough, in a quite modern handling of the same scene this characteristic of the third one which has struck us makes its appearance again. In the libretto of Offenbach's *La Belle Hélène*, Paris, after telling of the solicitations of the other two goddesses, describes Aphrodite's behaviour in this competition for the beauty-prize:

La troisième, ah! la troisième . . .
 La troisième ne dit rien.
 Elle eut le prix tout de même . . .³

¹ 'Plainness' according to another reading.

² In Schlegel's translation this allusion is quite lost; indeed, it is given the opposite meaning: 'Dein schlichtes Wesen spricht beredt mich an.' ['Thy plainness speaks to me with eloquence.']

³ [Literally: 'The third one, ah! the third one . . . the third one said nothing. She won the prize all the same.']

If we decide to regard the peculiarities of our 'third one' as concentrated in her 'dumbness', then psycho-analysis will tell us that in dreams dumbness is a common representation of death.¹

More than ten years ago a highly intelligent man told me a dream which he wanted to use as evidence of the telepathic nature of dreams. In it he saw an absent friend from whom he had received no news for a very long time, and reproached him energetically for his silence. The friend made no reply. It afterwards turned out that he had met his death by suicide at about the time of the dream. Let us leave the problem of telepathy on one side: there seems, however, not to be any doubt that here the dumbness in the dream represented death. Hiding and being unfindable - a thing which confronts the prince in the fairy tale of Cinderella three times, is another unmistakable symbol of death in dreams; so, too, is a marked pallor, of which the 'paleness' of the lead in one reading of Shakespeare's text is a reminder.² It would be very much easier for us to transpose these interpretations from the language of dreams to the mode of expression used in the myth that is now under consideration if we could make it seem probable that dumbness must be interpreted as a sign of being dead in productions other than dreams.

At this point I will single out the ninth story in Grimm's *Fairy Tales*, which bears the title 'The Twelve Brothers'. A king and a queen have twelve children, all boys. The king declares that if the thirteenth child is a girl, the boys will have to die. In expectation of her birth he has twelve coffins made. With their mother's help the twelve sons take refuge in a hidden wood, and swear death to any girl they may meet. A girl is born, grows up, and learns one day from her mother that she has had twelve brothers. She decides to seek them out, and in the wood she finds the youngest; he recognizes her, but is anxious to hide her on account of the brothers' oath. The sister says: 'I will gladly die, if by so doing I can save my twelve brothers.' The brothers welcome her affectionately, however, and she stays with them and looks after their house for them. In a little garden beside the house grow twelve lilies. The girl picks them and gives one to each brother. At that moment the brothers are changed into ravens, and disappear, together with the house and garden. (Ravens are spirit-birds; the killing of the twelve brothers by their sister is represented by the picking of the flowers, just as it is at the beginning of the story by the coffins and the disappearance of the brothers.) The girl, who is once more ready to save her brothers from death, is now told that as a condition she must be dumb for seven years, and not speak a single word. She submits to the test, which brings her herself into mortal danger. She herself, that is, dies for her brothers, as she promised to do before she met them. By remaining dumb she succeeds at last in setting the ravens free.

¹ In Stekel's *Sprache des Traumes*, too, dumbness is mentioned among the 'death' symbols (1911a, 351).

² Stekel (1911a), loc. cit.

In the story of 'The Six Swans' the brothers who are changed into birds are set free in exactly the same way - they are restored to life by their sister's dumbness. The girl has made a firm resolve to free her brothers, 'even if it should cost her her life'; and once again (being the wife of the king) she risks her own life because she refuses to give up her dumbness in order to defend herself against evil accusations.

It would certainly be possible to collect further evidence from fairy tales that dumbness is to be understood as representing death. These indications would lead us to conclude that the third one of the sisters between whom the choice is made is a dead woman. But she may be something else as well - namely, Death itself, the Goddess of Death. Thanks to a displacement that is far from infrequent, the qualities that a deity imparts to men are ascribed to the deity himself. Such a displacement will surprise us least of all in relation to the Goddess of Death, since in modern versions and representations, which these stories would thus be forestalling, Death itself is nothing other than a dead man.

If the third of the sisters is the Goddess of Death, the sisters are known to us. They are the Fates, the Moerae, the Parcae or the Norns, the third of whom is called Atropos, the inexorable.

II

We will for the time being put aside the task of inserting the interpretation that we have found into our myth, and listen to what the mythologists have to teach us about the role and origin of the Fates.¹

The earliest Greek mythology (in Homer) only knew a single personifying inevitable fate. The further development of this one Moera into a company of three (or less often two) sister-goddesses probably came about on the basis of other divine figures to which the Moerae were closely related - the Graces and the Horae [the Seasons].

The Horae were originally goddesses of the waters of the sky, dispensing rain and dew, and of the clouds from which rain falls; and, since the clouds were conceived of as something that has been spun, it came about that these goddesses were looked upon as spinners, an attribute that then became attached to the Moerae. In the sun-favoured Mediterranean lands it is the rain on which the fertility of the soil depends, and thus the Horae became vegetation goddesses. The beauty of flowers and the abundance of fruit was their doing, and they were accredited with a wealth of agreeable and charming traits. They became the divine representatives of the Seasons, and it is possibly owing to this connection that there were three of them, if the sacred nature of the number three is not a sufficient explanation. For the peoples of antiquity at first distinguished only three seasons: winter, spring and summer. Autumn was only added in late Graeco-Roman times, after which the Horae were often represented in art as four in number.

The Horae retained their relation to time. Later they presided over the times of day, as they did at first over the times of the year; and at last their name came to be merely a designation of the hours (*heure, ora*). The Norns of German mythology are akin to the Horae and the Moerae and exhibit this time signification in their names. It was inevitable, however, that a deeper view should come to be taken of the essential nature of these deities, and that their essence should be transposed on to the regularity with which the seasons change. The Horae thus became the guardians of natural law and of the divine Order which causes the same thing to recur in Nature in an unalterable sequence.

¹ What follows is taken from Roscher's lexicon, under the relevant headings.

This discovery of Nature reacted on the conception of human life. The nature-myth changed into a human myth: the weather-goddesses became goddesses of Fate. But this aspect of the Horae found expression only in the Moerae, who watch over the necessary ordering of human life as inexorably as do the Horae over the regular order of nature. The ineluctable severity of Law and its relation to death and dissolution, which had been avoided in the charming figures of the Horae, were now stamped upon the Moerae, as though men had only perceived the full seriousness of natural law when they had to submit their own selves to it.

The names of the three spinners, too, have been significantly explained by mythologists. Lachesis, the name of the second, seems to denote 'the accidental that is included in the regularity of destiny'¹ - or, as we should say, 'experience'; just as Atropos stands for 'the ineluctable' - Death. Clotho would then be left to mean the innate disposition with its fateful implications.

But now it is time to return to the theme which we are trying to interpret - the theme of the choice between three sisters. We shall be deeply disappointed to discover how unintelligible the situations under review become and what contradictions of their apparent content result, if we apply to them the interpretation that we have found. On our supposition the third of the sisters is the Goddess of Death, Death itself. But in the Judgement of Paris she is the Goddess of Love, in the tale of Apuleius she is someone comparable to the goddess for her beauty, in *The Merchant of Venice* she is the fairest and wisest of women, in *King Lear* she is the one loyal daughter. We may ask whether there can be a more complete contradiction. Perhaps, improbable though it may seem, there is a still more complete one lying close at hand. Indeed, there certainly is; since, whenever our theme occurs, the choice between the women is free, and yet it falls on death. For, after all, no one chooses death, and it is only by a fatality that one falls a victim to it.

¹ Roscher, quoting Preller, ed. Robert (1894).

However, contradictions of a certain kind - replacements by the precise opposite - offer no serious difficulty to the work of analytic interpretation. We shall not appeal here to the fact that contraries are so often represented by one and the same element in the modes of expression used by the unconscious, as for instance in dreams. But we shall remember that there are motive forces in mental life which bring about replacement by the opposite in the form of what is known as reaction-formation; and it is precisely in the revelation of such hidden forces as these that we look for the reward of this enquiry. The Moerae were created as a result of a discovery that warned man that he too is a part of nature and therefore subject to the immutable law of death. Something in man was bound to struggle against this subjection, for it is only with extreme unwillingness that he gives up his claim to an exceptional position. Man, as we know, makes use of his imaginative activity in order to satisfy the wishes that reality does not satisfy. So his imagination rebelled against the recognition of the truth embodied in the myth of the Moerae, and constructed instead the myth derived from it, in which the Goddess of Death was replaced by the Goddess of Love and by what was equivalent to her in human shape. The third of the sisters was no longer Death; she was the fairest, best, most desirable and most lovable of women. Nor was this substitution in any way technically difficult: it was prepared for by an ancient ambivalence, it was carried out along a primaeval line of connection which could not long have been forgotten. The Goddess of Love herself, who now took the place of the Goddess of Death, had once been identical with her. Even the Greek Aphrodite had not wholly relinquished her connection with the underworld, although she had long surrendered her chthonic role to other divine figures, to Persephone, or to the tri-form Artemis-Hecate. The great Mother-goddesses of the oriental peoples, however, all seem to have been both creators and destroyers - both goddesses of life and fertility and goddesses of death. Thus the replacement by a wishful opposite in our theme harks back to a primaeval identity.

The same consideration answers the question how the feature of a choice came into the myth of the three sisters. Here again there has been a wishful reversal. Choice stands in the place of necessity, of destiny. In this way man overcomes death, which he has recognized intellectually. No greater triumph of wish-fulfilment is conceivable. A choice is made where in reality there is obedience to a compulsion; and what is chosen is not a figure of terror, but the fairest and most desirable of women.

On closer inspection we observe, to be sure, that the original myth is not so thoroughly distorted that traces of it do not show through and betray its presence. The free choice between the three sisters is, properly speaking, no free choice, for it must necessarily fall on the third if every kind of evil is not to come about, as it does in *King Lear*. The fairest and best of women, who has taken the place of the Death-goddess, has kept certain characteristics that border on the uncanny, so that from there we have been able to guess at what lies beneath.¹

So far we have been following out the myth and its transformation, and it is to be hoped that we have correctly indicated the hidden causes of the transformation. We may now turn our interest to the way in which the dramatist has made use of the theme. We get an impression that a reduction of the theme to the original myth is being carried out in his work, so that we once more have a sense of the moving significance which had been weakened by the distortion. It is by means of this reduction of the distortion, this partial return to the original, that the dramatist achieves his more profound effect upon us.

To avoid misunderstandings, I should like to say that it is not my purpose to deny that *King Lear's* dramatic story is intended to inculcate two wise lessons: that one should not give up one's possessions and rights during one's lifetime, and that one must guard against accepting flattery at its face value. These and similar warnings are undoubtedly brought out by the play; but it seems to me quite impossible to explain the overpowering effect of *King Lear* from the impression that such a train of thought would produce, or to suppose that the dramatist's personal motives did not go beyond the intention of teaching these lessons. It is suggested, too, that his purpose was to present the tragedy of ingratitude, the sting of which he may well have felt in his own heart, and that the effect of the play rests on the purely formal element of its artistic presentation; but this cannot, so it seems to me, take the place of the understanding brought to us by the explanation we have reached of the theme of the choice between the three sisters.

¹ The Psyche of Apuleius's story has kept many traits that remind us of her relation with death. Her wedding is celebrated like a funeral, she has to descend into the underworld, and afterwards she sinks into a death-like sleep (Otto Rank). - On the significance of Psyche as goddess of the spring and as 'Bride of Death', cf. Zinzow (1881). - In another of Grimm's Tales ('The Goose-girl at the Fountain', No. 179) there is, as in 'Cinderella', an alternation between the beautiful and the ugly aspect of the third sister, in which one may no doubt see an indication of her double nature - before and after the substitution. This third daughter is repudiated by her father, after a test which is almost the same as the one in *King Lear*. Like her sisters, she has to declare how fond she is of their father, but can find no expression for her love but a comparison with salt. (Kindly communicated by Dr. Hanns Sachs.)

Lear is an old man. It is for this reason, as we have already said, that the three sisters appear as his daughters. The relationship of a father to his children, which might be a fruitful source of many dramatic situations, is not turned to further account in the play. But Lear is not only an old man: he is a dying man. In this way the extraordinary premiss of the division of his inheritance loses all its strangeness. But the doomed man is not willing to renounce the love of women; he insists on hearing how much he is loved. Let us now recall the moving final scene, one of the culminating points of tragedy in modern drama. Lear carries Cordelia's dead body on to the stage. Cordelia is Death. If we reverse the situation it becomes intelligible and familiar to us. She is the Death-goddess who, like the Valkyrie in German mythology, carries away the dead hero from the battlefield. Eternal wisdom, clothed in the primaeval myth, bids the old man renounce love, choose death and make friends with the necessity of dying.

The dramatist brings us nearer to the ancient theme by representing the man who makes the choice between the three sisters as aged and dying. The regressive revision which he has thus applied to the myth, distorted as it was by wishful transformation, allows us enough glimpses of its original meaning to enable us perhaps to reach as well a superficial allegorical interpretation of the three female figures in the theme. We might argue that what is represented here are the three inevitable relations that a man has with a woman - the woman who bears him, the woman who is his mate and the woman who destroys him; or that they are the three forms taken by the figure of the mother in the course of a man's life - the mother herself, the beloved one who is chosen after her pattern, and lastly the Mother Earth who receives him once more. But it is in vain that an old man yearns for the love of woman as he had it first from his mother; the third of the Fates alone, the silent Goddess of Death, will take him into her arms.

TWO LIES TOLD BY CHILDREN
(1913)

Intentionally left blank

TWO LIES TOLD BY CHILDREN

We can understand children telling lies, when in doing so, they are imitating the lies told by grown-up people. But a number of lies told by well-brought-up children have a particular significance and should cause those in charge of them to reflect rather than be angry. These lies occur under the influence of excessive feelings of love, and become momentous when they lead to a misunderstanding between the child and the person it loves.

I

A girl of seven (in her second year at school) had asked her father for some money to buy colours for painting Easter eggs. Her father had refused, saying he had no money. Shortly afterwards the girl asked her father for some money for a contribution towards a wreath for the funeral of their reigning princess, who had recently died. Each of the schoolchildren was to bring fifty pfennigs. Her father gave her ten marks; she paid her contribution, put nine marks on her father's writing-table, and with the remaining fifty pfennigs bought some paints, which she hid in her toy cupboard. At dinner her father asked suspiciously what she had done with the missing fifty pfennigs, and whether she had not bought paints with them after all. She denied it; but her brother, who was two years her elder and with whom she had planned to paint the eggs, betrayed her; the paints were found in the cupboard. The angry father handed the culprit over to her mother for punishment, and it was severely administered. Afterwards her mother was herself much shaken, when she saw how great the child's despair was. She caressed the little girl after the punishment, and took her for a walk to console her. But the effects of the experience, which were described by the patient herself as the 'turning-point in her life', proved to be ineradicable. Up to then she had been a wild, self-confident child, afterwards she became shy and timid. When she was engaged to be married and her mother undertook the purchase of her furniture and her trousseau, she flew into a rage which was incomprehensible even to herself. She had a feeling that after all it was *her* money, and no one else ought to buy anything with it. As a young wife she was shy of asking her husband for any expenditure on her personal needs, and made an uncalled-for distinction between 'her' money and his. During the treatment it happened now and again that her husband's remittances to her were delayed, so that she was left without resources in a foreign city. After she had told me this once, I made her promise that if it happened again she would borrow the small sum necessary from me. She promised to do so; but on the next occasion of financial embarrassment she did not keep her promise, but preferred to pawn her jewellery. She explained that she could not take money from me.

The appropriation of the fifty pfennigs in her childhood had had a significance which her father could not guess. Some time before she began going to school she had played a singular prank with money. A neighbour with whom they were friendly had sent the girl out with a small sum of money, in the company of her own little boy who was even younger, to buy something in a shop. Being the elder of the two, she was bringing the change back home. But, meeting the neighbour's servant in the street, she threw the money down on the pavement. In the analysis of this action, which she herself found inexplicable, the thought of Judas occurred to her, who threw down the thirty pieces of silver which he had been given for betraying his Master. She said she was certainly acquainted with the story of the Passion before she went to school. But in what way could she identify herself with Judas?

When she was three and a half she had a nursemaid of whom she was extremely fond. This girl became involved in a love affair with a doctor whose surgery she visited with the child. It appears that at that time the child witnessed various sexual proceedings. It is not certain whether she saw the doctor give the girl money; but there is no doubt that, to make sure of the child's keeping silence, the girl gave her some small coins, with which purchases were made (probably of sweets) on the way home. It is possible too that the doctor himself occasionally gave the child money. Nevertheless the child betrayed the girl to her mother out of jealousy. She played so ostentatiously with the coins she had brought home that her mother could not help asking: 'Where did you get that money?' The girl was dismissed.

To take money from anyone had thus early come to mean to her a physical surrender, an erotic relation. To take money from her father was equivalent to a declaration of love. The phantasy that her father was her lover was so seductive that with its help her childish wish for paints for the Easter eggs easily put itself into effect in spite of the prohibition. She could not admit, however, that she had appropriated the money; she was obliged to disavow it, because her motive for the deed, which was unconscious to herself, could not be admitted. Her father's punishment was thus a rejection of the tenderness she was offering him - a humiliation - and so it broke her spirit. During the treatment a period of severe depression occurred (whose explanation led to her remembering the events described here) when on one occasion I was obliged to reproduce this humiliation by asking her not to bring me any more flowers.

For psycho-analysts I need hardly emphasize the fact that in this little experience of the child's we have before us one of those extremely common cases in which early anal erotism persists into later erotic life. Even her desire to paint the eggs with colours derived from the same source.

II

A woman who is now seriously ill in consequence of a frustration in life was in her earlier years a particularly capable, truth-loving, serious and virtuous girl, and became an affectionate wife. But still earlier, in the first years of her life, she had been a wilful and discontented child, and, though she had changed fairly quickly into an excessively good and conscientious one, there were occurrences in her schooldays, which, when she fell ill, caused her deep self-reproaches, and were regarded by her as proofs of fundamental depravity. Her memory told her that in those days she had often bragged and lied. Once on the way to school a school-fellow had said boastfully: 'Yesterday we had ice at dinner.' She replied: 'Oh we have ice every day.' In reality she did not know what ice at dinner could mean; she only knew ice in the long blocks in which it is carted about, but she assumed that there must be something grand in having it for dinner, so she refused to be outdone by her school-fellow.

When she was ten years old, they were set the task in the drawing lesson of making a free-hand drawing of a circle. But she used a pair of compasses, thus easily producing a perfect circle, and showed her achievement in triumph to her neighbour in class. The mistress came up, heard her boasting, discovered the marks of the compasses in the circle, and questioned the girl. But she stubbornly denied what she had done, would not give way to any evidence, and took refuge in sullen silence. The mistress consulted with her father about it. They were both influenced by the girl's usually good behaviour into deciding not to take any further steps about the matter.

Both the child's lies were instigated by the same complex. As the eldest of five children, the little girl early developed an unusually strong attachment to her father, which was destined when she was grown up to wreck her happiness in life. But she could not long escape the discovery that her beloved father was not so great a personage as she was inclined to think him. He had to struggle against money difficulties; he was not so powerful or so distinguished as she had imagined. But she could not put up with this departure from her ideal. Since, as women do, she based all her ambition on the man she loved, she became too strongly dominated by the motive of supporting her father against the world. So she boasted to her school-fellows, in order not to have to belittle her father. When, later on, she learned to translate ice for dinner by '*glace*', her self-reproaches about this reminiscence led her by an easy path into a pathological dread of pieces or splinters of glass.

Her father was an excellent draughtsman, and had often enough excited the delight and admiration of the children by exhibitions of his skill. It was as an identification of herself with her father that she had drawn the circle at school - which she could only do successfully by deceitful methods. It was as though she wanted to boast: 'Look at what my father can do!' The sense of guilt that was attached to her excessive fondness for her father found its expression in connection with her attempted deception; an admission was impossible for the same reason that was given in the first of these observations: it would inevitably have been an admission of her hidden incestuous love.

Two Lies Told By Children

2620

We should not think lightly of such episodes in the life of children. It would be a serious mistake to read into childish misdemeanours like these a prognosis of the development of a bad character. Nevertheless, they are intimately connected with the most powerful motive forces in children's minds, and give notice of dispositions that will lead to later eventualities in their lives or to future neuroses.

THE DISPOSITION TO OBSESSIONAL NEUROSIS
A CONTRIBUTION TO THE PROBLEM OF CHOICE OF NEUROSIS
(1913)

Intentionally left blank

THE DISPOSITION TO OBSESSIONAL NEUROSIS A CONTRIBUTION TO THE PROBLEM OF CHOICE OF NEUROSIS

The problem of why and how a person may fall ill of a neurosis is certainly among those to which psycho-analysis should offer a solution. But it will probably be necessary to find a solution first to another and narrower problem - namely, why it is that this or that person must fall ill of a particular neurosis and of none other. This is the problem of 'choice of neurosis'.

What do we know so far about this problem? Strictly speaking, only one single general proposition can be asserted on the subject with certainty. It will be recalled that we divide the pathogenic determinants concerned in the neuroses into those which a person brings along with him into his life and those which life brings to him - the constitutional and the accidental - by whose combined operation alone the pathogenic determinant is as a rule established. The general proposition, then, which I have alluded to above, lays it down that the grounds for determining the choice of neurosis are entirely of the former kind - that is, that they are in the nature of dispositions and are independent of experiences which operate pathogenically.

Where are we to look for the source of these dispositions? We have become aware that the psychical functions concerned - above all, the sexual function, but various important ego-functions too - have to undergo a long and complicated development before reaching the state characteristic of the normal adult. We can assume that these developments are not always so smoothly carried out that the total function passes through this regular progressive modification. Wherever a portion of it clings to a previous stage, what is known as a 'point of fixation' results, to which the function may regress if the subject falls ill through some external disturbance.

Thus our dispositions are inhibitions in development. We are confirmed in this view by the analogy of the facts of general pathology of other illnesses. But before the question as to what factors can bring about such disturbances of development the work of psycho-analysis comes to a stop: it leaves that problem to biological research.¹

Already a few years back we ventured, with the help of these hypotheses, to approach the problem of choice of neurosis. Our method of work, which aims at discovering normal conditions by studying their disturbances, led us to adopt a very singular and unexpected line of attack. The order in which the main forms of psychoneurosis are usually enumerated - Hysteria, Obsessional Neurosis, Paranoia, Dementia Praecox - corresponds (even though not quite exactly) to the order of the ages at which the onset of these disorders occurs. Hysterical forms of illness can be observed even in earliest childhood; obsessional neurosis usually shows its first symptoms in the second period of childhood (between the ages of six and eight); while the two other psychoneuroses, which I have brought together under the heading of 'paraphrenia', do not appear until after puberty and during adult life. It is these disorders - the last to emerge - which were the first to show themselves accessible to our enquiry into the dispositions that result in the choice of neurosis. The characteristics peculiar to both of them - megalomania, turning away from the world of objects, increased difficulty in transference - have obliged us to conclude that their dispositional fixation is to be looked for in a stage of libidinal development *before* object-choice has been established - that is in the phase of auto-erotism and of narcissism. Thus these forms of illness, which make their appearance so late, go back to very early inhibitions and fixations.

¹ Since Wilhelm Fliess's writings have revealed the biological significance of certain periods of time it has become conceivable that disturbances of development may be traceable to temporal changes in the successive waves of development.

This would accordingly lead us to suppose that the disposition to hysteria and obsessional neurosis, the two transference neuroses proper, which produce their symptoms at an early age, lies in later phases of libidinal development. But at what point in them should we find a developmental inhibition? and, above all, what would be the difference in phases that would determine a disposition to obsessional neurosis as contrasted with hysteria? For a long time nothing was to be learned about this; and my earlier attempts at discovering these two dispositions - the notion, for instance, that hysteria might be determined by passivity and obsessional neurosis by activity in infantile experience - had soon to be abandoned as incorrect.

I shall now take my footing once more on the clinical observation of an individual case. Over a long period I studied a woman patient whose neurosis underwent an unusual change. It began, after a traumatic experience, as a straightforward anxiety hysteria and retained that character for a few years. One day, however, it suddenly changed into an obsessional neurosis of the severest type. A case of this kind could not fail to become significant in more than one direction. On the one hand, it might perhaps claim to be looked upon like a bilingual document and to show how an identical content could be expressed by the two neuroses in different languages. On the other hand, it threatened to contradict completely our theory that disposition arises from developmental inhibition, unless we were prepared to accept the supposition that a person could innately possess more than one weak spot in his libidinal development. I told myself that we had no right to dismiss this latter possibility; but I was greatly interested to arrive at an understanding of the case.

When in the course of the analysis this came about, I was forced to see that the situation was quite different from what I had imagined. The obsessional neurosis was not a further reaction to the same trauma which had first provoked the anxiety hysteria; it was a reaction to a second experience, which had completely wiped out the first. (Here, then, we have an exception - though, it is true, a not indisputable one - to our proposition affirming that choice of neurosis is independent of experience.)

Unfortunately I am unable, for familiar reasons, to enter into the history of the case as far as I should like, and I must restrict myself to the account which follows. Up to the time of her falling ill the patient had been a happy and almost completely satisfied wife. She wanted to have children, from motives based on an infantile fixation of her wishes, and she fell ill when she learned that it was impossible for her to have any by the husband who was the only object of her love. The anxiety hysteria with which she reacted to this frustration corresponded, as she herself soon learned to understand, to the repudiation of phantasies of seduction in which her firmly implanted wish for a child found expression. She now did all she could to prevent her husband from guessing that she had fallen ill owing to the frustration of which he was the cause. But I have had good reason for asserting that everyone possesses in his own unconscious an instrument with which he can interpret the utterances of the unconscious in other people. Her husband understood, without any admission or explanation on her part, what his wife's anxiety meant; he felt hurt, without showing it, and in his turn reacted neurotically by - for the first time - failing in sexual intercourse with her. Immediately afterwards he started on a journey. His wife believed that he had become permanently impotent, and produced her first obsessional symptoms on the day before his expected return.

The content of her obsessional neurosis was a compulsion for scrupulous washing and cleanliness and extremely energetic protective measures against severe injuries which she thought other people had reason to fear from her - that is to say, reaction-formations against her own *anal-erotic* and *sadistic* impulses. Her sexual need was obliged to find expression in these shapes after her genital life had lost all its value owing to the impotence of the only man of whom there could be any question for her.

This is the starting-point of the small new fragment of theory which I have formulated. It is of course only in appearance that it is based on this one observation; actually it brings together a large number of earlier impressions, though an understanding of them was only made possible by this last experience. I told myself that my schematic picture of the development of the libidinal function called for an extra insertion in it. To begin with, I had only distinguished, first the phase of auto-erotism during which the subject's component instincts, each on its own account, seek for the satisfaction of their desires in his own body, and then the combination of all the component instincts for the choice of an object, under the primacy of the genitals acting on behalf of reproduction. The analysis of the paraphrenias has, as we know, necessitated the insertion between them of a stage of narcissism, during which the choice of an object has already taken place but that object coincides with the subject's own ego. And now we see the need for yet another stage to be inserted before the final shape is reached - a stage in which the component instincts have already come together for the choice of an object and that object is already something extraneous in contrast to the subject's own self, but in which *the primacy of the genital zones has not yet been established*. On the contrary, the component instincts which dominate this *pregenital organization* of sexual life are the anal-erotic and sadistic ones.

I am aware that any such hypotheses sound strange at first. It is only by discovering their relations to our former knowledge that they become familiar to us; and in the end it is often their fate to be regarded as minor and long-foreseen innovations. Let us therefore turn with anticipations such as these to a discussion of the 'pregenital sexual organization'.

(a) The extraordinary part played by impulses of hatred and anal erotism in the symptomatology of obsessional neurosis has already struck many observers and has recently been emphasized with particular clarity by Ernest Jones (1913). This follows directly from our hypothesis if we suppose that in that neurosis the component instincts in question have once more taken over the representation of the genital instincts, whose forerunners they were in the process of development.

At this point a portion of our case history fits in, which I have so far kept back. The patient's sexual life began in her earliest childhood with beating-phantasies. After they were suppressed, an unusually long period of latency set in, during which the girl passed through a period of exalted moral growth, without any awakening of female sexual feelings. Her marriage, which took place at an early age, opened a time of normal sexual activity. This period, during which she was a happy wife, continued for a number of years, until her first great frustration brought on the hysterical neurosis. When this was followed by her genital life losing all its value, her sexual life, as I have said, returned to the infantile stage of sadism.

It is not difficult to determine the characteristic which distinguishes this case of obsessional neurosis from those more frequent ones which start at an early age and thereafter run a chronic course with exacerbations of a more or less striking kind. In these other cases, once the sexual organization which contains the disposition to obsessional neurosis is established it is never afterwards completely surmounted; in our case it was replaced to begin with by the higher stage of development, and was then re-activated by regression from the latter.

(b) If we wish to bring our hypothesis into contact with biological lines of thought, we must not forget that the antithesis between male and female, which is introduced by the reproductive function, cannot be present as yet at the stage of pregenital object-choice. We find in its place the antithesis between trends with an active and with a passive aim, an antithesis which later becomes firmly attached to that between the sexes. Activity is supplied by the common instinct of mastery, which we call sadism when we find it in the service of the sexual function; and even in fully developed normal sexual life it has important subsidiary services to perform. The passive trend is fed by anal erotism, whose erotogenic zone corresponds to the old, undifferentiated cloaca. A stressing of this anal erotism in the pregenital stage of organization leaves behind a significant predisposition to homosexuality in men when the next stage of the sexual function, the primacy of the genitals, is reached. The way in which this last phase is erected upon the preceding one and the accompanying remoulding of the libidinal cathexes present analytic research with the most interesting problems.

The view may be taken that all the difficulties and complications involved in this can be avoided by denying that there is any pregenital organization of sexual life and by holding that sexual life coincides with the genital and reproductive function and begins with it. It would then be asserted, having regard to the unmistakable findings of analytic research, that the neuroses are compelled by the process of sexual repression to give expression to sexual trends through other, non-sexual instincts, and thus to sexualize the latter by way of compensation. But this line of argument would place us outside psycho-analysis. It would place us where we were before psycho-analysis and would mean abandoning the understanding which psycho-analysis has given us of the relations between health, perversion and neurosis. Psycho-analysis stands or falls with the recognition of the sexual component instincts, of the erotogenic zones and of the extension thus made possible of the concept of a 'sexual function' in contrast to the narrower 'genital function'. Moreover the observation of the normal development of children is in itself enough to make us reject any such temptation.

(c) In the field of the development of *character* we are bound to meet with the same instinctual forces which we have found at work in the neuroses. But a sharp theoretical distinction between the two is necessitated by the single fact that the failure of repression and the return of the repressed - which are peculiar to the mechanism of neurosis - are absent in the formation of character. In the latter, repression either does not come into action or smoothly achieves its aim of replacing the repressed by reaction-formations and sublimations. Hence the processes of the formation of character are more obscure and less accessible to analysis than neurotic ones.

But it is precisely in the field of character-development that we come across a good analogy with the case we have been describing - a confirmation, that is, of the occurrence of the pregenital sadistic anal-erotic sexual organization. It is a well-known fact, and one that has given much ground for complaint, that after women have lost their genital function their character often undergoes a peculiar alteration. They become quarrelsome, vexatious and overbearing, petty and stingy; that is to say, they exhibit typically sadistic and anal-erotic traits which they did not possess earlier, during their period of womanliness. Writers of comedy and satirists have in all ages directed their invectives against the 'old dragon' into which the charming girl, the loving wife and the tender mother have been transformed. We can see that this alteration of character corresponds to a regression of sexual life to the pregenital sadistic and anal-erotic stage, in which we have discovered the disposition to obsessional neurosis. It seems, then, to be not only the precursor of the genital phase but often enough its successor as well, its termination after the genitals have fulfilled their function.

A comparison between such a change of character and obsessional neurosis is very impressive. In both cases the work of regression is apparent. But whereas in the former we find complete regression following repression (or suppression) that has occurred smoothly, in the neurosis there are conflict, an effort to prevent regression from occurring, reaction-formations against it and symptom-formations produced by compromises between the two opposing sides, and a splitting of the psychical activities into some that are admissible to consciousness and others that are unconscious.

(d) Our hypothesis of a pregenital sexual organization is incomplete in two respects. In the first place, it takes no account of the behaviour of other component instincts, in regard to which there is plenty that would repay examination and discussion, and it is content with stressing the striking primacy of sadism and anal erotism. In particular we often gain an impression that the instinct for knowledge can actually take the place of sadism in the mechanism of obsessional neurosis. Indeed it is at bottom a sublimated off-shoot of the instinct of mastery exalted into something intellectual, and its repudiation in the form of doubt plays a large part in the picture of obsessional neurosis.

The second gap in our hypothesis is far more important. As we know, the developmental disposition to a neurosis is only complete if the phase of the development of the ego at which fixation occurs is taken into account as well as that of the libido. But our hypothesis has only related to the latter, and therefore does not include all the knowledge that we should demand. The stages of development of the ego-instincts are at present very little known to us; I know of only one attempt - the highly promising one made by Ferenczi (1913) - to approach these questions. I cannot tell if it may seem too rash if, on the basis of such indications as we possess, I suggest the possibility that a chronological outstripping of libidinal development by ego development should be included in the disposition to obsessional neurosis. A precocity of this kind would necessitate the choice of an object under the influence of the ego-instincts, at a time at which the sexual instincts had not yet assumed their final shape, and a fixation at the stage of the pregenital sexual organization would thus be left. If we consider that obsessional neurotics have to develop a super-morality in order to protect their object-love from the hostility lurking behind it, we shall be inclined to regard some degree of this precocity of ego development as typical of human nature and to derive the capacity for the origin of morality from the fact that in the order of development hate is the precursor of love. This is perhaps the meaning of an assertion by Stekel (1911a, 536), which at the time I found incomprehensible, to the effect that hate and not love is the primary emotional relation between men.

(e) It follows from what has been said that there remains for hysteria an intimate relation to the final phase of libidinal development, which is characterized by the primacy of the genitals and the introduction of the reproductive function. In hysterical neurosis this acquisition is subjected to repression, which does not involve regression to the pregenital stage. The gap in determining the disposition owing to our ignorance of ego development is even more obvious here than with obsessional neurosis.

On the other hand, it is not hard to show that another regression to an earlier level occurs in hysteria too. The sexuality of female children, is, as we know, dominated and directed by a masculine organ (the clitoris) and often behaves like the sexuality of boys. This masculine sexuality has to be got rid of by a last wave of development at puberty, and the vagina, an organ derived from the cloaca, has to be raised into the dominant erotogenic zone. Now, it is very common in hysterical neurosis for this repressed masculine sexuality to be re-activated and then for the defensive struggle on the part of the ego-syntonic instincts to be directed against it. But it seems to me too early to enter here into a discussion of the problems of the disposition to hysteria.

INTRODUCTION TO PFISTER'S *THE PSYCHO-ANALYTIC METHOD*
(1913)

Intentionally left blank

INTRODUCTION TO PFISTER'S *THE PSYCHO-ANALYTIC METHOD*

Psycho-analysis had its origin on medical soil, as a therapeutic procedure for the treatment of certain nervous illnesses which were termed 'functional' and which were considered with increasing certainty to be consequences of disturbances in emotional life. It attains its end - of removing the manifestations of these disturbances, the symptoms - by assuming that they are not the only possible and final outcome of particular psychical processes. It therefore uncovers the history of the development of these symptoms in the patient's memory, it revivifies the processes underlying them, and then conducts them, under the doctor's guidance, to a more favourable outlet. Psycho-analysis has set itself the same therapeutic aims as treatment by hypnotism, which was introduced by Liébeault and Bernheim and after lengthy and severe struggles achieved a place in the technique of nerve specialists. But it goes far deeper into the structure of the mechanism of the mind, and seeks to bring about permanent results and viable changes in its subjects.

In its time, hypnotic treatment by suggestion very soon passed beyond the sphere of medical application and entered the service of the education¹ of young people. If we are to believe the reports, it proved to be an effective means forgetting rid of childish faults, of inconvenient physical habits and of character traits that were otherwise irreducible. No one at that time objected to, or was surprised at, this extension of its uses, which, incidentally, has only been made fully understandable by the researches of psycho-analysis. For we know to-day that pathological symptoms are often nothing but substitutes for bad (that is, unserviceable) inclinations, and that the determinants of these symptoms are laid down in the years of childhood and youth - during the same period in which human beings are the subject of education - whether the illnesses themselves already emerge in youth or only at a later time of life.

¹ [The German words '*Erziehung*' and '*Erzieher*', which are here translated throughout by 'education' and 'educator', have in fact a wider application and include the general notion of the 'up-bringing' of children.]

Education and therapeutics stand in an assignable relation to each other. Education seeks to ensure that certain of a child's dispositions and inclinations shall not cause any damage either to the individual or to society. Therapeutics come into action if these same dispositions have already led to the unwished-for result of pathological symptoms. The alternative outcome - of the child's unserviceable dispositions leading, not to substitutes in the form of symptoms, but to direct perversions of character - is almost inaccessible to therapeutics and as a rule beyond the influence of an educator. Education is a prophylaxis, which is intended to obviate both outcomes - neurosis and perversion alike; psychotherapy seeks, to undo the less stable of the two outcomes and to institute a kind of after-education.

In view of this position of affairs, the question automatically arises whether psycho-analysis should not be used for educative purposes just as hypnotic suggestion was in the past. The advantages would be obvious. The educator would, on the one hand, be prepared by his knowledge of the general human dispositions of childhood to judge which of those dispositions are threatening to lead to an undesirable outcome; and, if psycho-analysis can influence the course taken by such developments, he could bring it into use *before* the signs of an unfavourable development set in. Thus, with the help of analysis, he could have a prophylactic influence on the child while it was still healthy. On the other hand, he could detect the *first* indications of a development in the direction of neurosis and could guard the child against its further development at a time at which, for various reasons, a child is never taken to see a doctor. One cannot but think that a psycho-analytic activity such as this on the part of the educator - and of the similarly placed pastoral worker in protestant countries - would inevitably be of inestimable value and might often make the intervention of a doctor unnecessary.

The only question is whether the practice of psycho-analysis may not have as its prerequisite a medical training, from which the educator and the pastoral worker must remain debarred, or whether there may be other considerations which are opposed to the suggestion that the technique of psycho-analysis should be confided to any but a doctor's hands. I confess that I can see no ground for any such reservations. The practice of psycho-analysis calls much less for medical training than for psychological instruction and a free human outlook. The majority of doctors are not equipped to practise psycho-analysis and have completely failed to grasp the value of that therapeutic procedure. The educator and the pastoral worker are bound by the standards of their profession to exercise the same consideration, care and restraint as are usually practised by the doctor, and apart from this their association with young people perhaps makes them better fitted to understand these young people's mental life. But in both cases the only guarantee of the harmless application of the analytic procedure must depend on the personality of the analyst.

Where a case borders upon mental abnormality, the analytic educator will be bound to make himself familiar with the most necessary psychiatric knowledge, and furthermore to call a doctor into consultation when the diagnosis and prognosis of the disturbance appear doubtful. In a number of cases it will only be possible to achieve success if there is collaboration between the educator and the doctor.

In one single respect an educator's responsibility may perhaps exceed that of a doctor. The doctor has as a rule to deal with psychical structures which have already become rigid and he will find in the patient's established individuality a limit to his own achievement but at the same time a guarantee of the patient's capacity to stand alone. The educator, however, works upon material which is plastic and open to every impression, and he must keep before himself an obligation not to mould the young mind in accordance with his own personal ideals but rather according to his subject's dispositions and possibilities.

Let us hope that the application of psycho-analysis to the service of education will quickly fulfil the hopes which educators and doctors may rightly attach to it. A book such as this of Pfister's, which seeks to acquaint educators with analysis, will then be able to count on the gratitude of later generations.

PREFACE TO BOURKE'S *SCATALOGIC RITES OF ALL NATIONS*
(1913)

Intentionally left blank

PREFACE TO BOURKE'S SCATALOGIC RITES OF ALL NATIONS

While I was living in Paris in 1885 as a pupil of Charcot, what chiefly attracted me, apart from the great man's own lectures, were the demonstrations and addresses given by Brouardel. He used to show us from post-mortem material at the morgue how much there was which deserved to be known by doctors but of which science preferred to take no notice. On one occasion he was discussing the indications which enabled one to judge the social rank, character and origin of an unidentified body, and I heard him say: '*Les genoux sales sont le signe d'une fille honnête.*' He was using a girl's dirty knees as evidence of her virtue!

The lesson that bodily cleanliness is far more readily associated with vice than with virtue often occurred to me later on, when psycho-analytic work made me acquainted with the way in which civilized men to-day deal with the problem of their physical nature. They are clearly embarrassed by anything that reminds them too much of their animal origin. They are trying to emulate the 'more perfected angels' in the last scene of *Faust*, who complain:

Uns bleibt ein Erdenrest
zu tragen peinlich,
und wär' er von Asbest,
er ist nicht reinlich.¹

Since, however, they must necessarily remain far removed from such perfection, men have chosen to evade the predicament by so far as possible denying the very existence of this inconvenient 'trace of the Earth', by concealing it from one another, and by withholding from it the attention and care which it might claim as an integrating component of their essential being. The wiser course would undoubtedly have been to admit its existence and to dignify it as much as its nature will allow.

¹ [Literally: 'We still have a trace of the Earth, which is distressing to bear; and though it were of asbestos it is not cleanly.']

It is far from being a simple matter to survey or describe the consequences involved in this way of treating the 'distressing trace of the Earth', of which the sexual and excretory functions may be considered the nucleus. It will be enough to mention a single one of these consequences, the one with which we are most concerned here: the fact that science is prohibited from dealing with these proscribed aspects of human life, so that anyone who studies such things is regarded as scarcely less 'improper' than someone who actually *does* improper things.

Nevertheless, psycho-analysis and folklore have not allowed themselves to be deterred from transgressing these prohibitions and have been able as a result to teach us all kinds of things that are indispensable for an understanding of human nature. If we limit ourselves here to what has been learnt about the excretory functions, it may be said that the chief finding from psycho-analytic research has been the fact that the human infant is obliged to recapitulate during the early part of his development the changes in the attitude of the human race towards excremental matters which probably had their start when *homo sapiens* first raised himself off Mother Earth. In the earliest years of infancy there is as yet no trace of shame about the excretory functions or of disgust at excreta. Small children show great interest in these, just as they do in others of their bodily secretions; they like occupying themselves with them and can derive many kinds of pleasure from doing so. Excreta, regarded as parts of a child's own body and as products of his own organism, have a share in the esteem - the narcissistic esteem, as we should call it - with which he regards everything relating to his self. Children are, indeed, proud of their own excretions and make use of them to help in asserting themselves against adults. Under the influence of its upbringing, the child's coprophilic instincts and inclinations gradually succumb to repression; it learns to keep them secret, to be ashamed of them and to feel disgust at their objects. Strictly speaking, however, the disgust never goes so far as to apply to a child's own excretions, but is content with repudiating them when they are the products of other people. The interest which has hitherto been attached to excrement is carried over on to other objects - for instance, from faeces on to money, which is, of course, late in acquiring significance for children. Important constituents in the formation of character are developed, or strengthened, from the repression of coprophilic inclinations.

Psycho-analysis further shows that, to begin with, excremental and sexual instincts are not distinct from each other in children. The divorce between them only occurs later and it remains incomplete. Their original affinity, which is established by the anatomy of the human body, still makes itself felt in many ways in normal adults. Finally, it should not be forgotten that these developments can no more be expected to yield a perfect result than any others. Some portion of the old preferences persist, some part of the coprophilic inclinations continue to operate in later life and are expressed in the neuroses, perversions and bad habits of adults.

Folklore has adopted a quite different method of research, and yet it has reached the same results as psycho-analysis. It shows us how incompletely the repression of coprophilic inclinations has been carried out among various peoples at various times and how closely at other cultural levels the treatment of excretory substances approximates to that practised by children. It also demonstrates the persistent and indeed ineradicable nature of coprophilic interests, by displaying to our astonished gaze the multiplicity of applications - in magical ritual, in tribal customs, in observances of religious cults and in the art of healing - by which the old esteem for human excretions has found new expression. The connection, too, with sexual life seems to be fully preserved.

This expansion of our knowledge clearly involves no risk to our morality. The major part of what is known of the role played by excretions in human life has been brought together in J. G. Bourke's *Scatalogic Rites of All Nations*. To make it accessible to German readers is therefore not only a courageous but also a meritorious undertaking.

THE SIGNIFICANCE OF SEQUENCES OF VOWELS (1911)

Objections have no doubt often been raised to the assertion made by Stekel that in dreams and associations names which have to be concealed seem to be replaced by others that resemble them only in containing the same sequence of vowels. A striking analogy is, however, provided from the history of religion. Among the ancient Hebrews the name of God was taboo; it might neither be spoken aloud nor written down. (This is far from being an isolated example of the special significance of names in archaic civilizations.) This prohibition was so implicitly obeyed that to this very day the vocalization of the four consonants in God's name (יהוה) remains unknown. It was, however, pronounced 'Jehovah', being supplied with the vowels of the word 'Adonai' ('Lord'), against which there was no such prohibition. (Reinach, 1905-12, 1, 1.)

‘GREAT IS DIANA OF THE EPHESIANS’ (1911)

The ancient Greek city of Ephesus in Asia Minor, for the exploration of whose ruins, incidentally, our Austrian archaeology has to be thanked, was especially celebrated in antiquity for its splendid temple dedicated to Artemis (Diana). Ionic invaders - perhaps in the eighth century before Christ - conquered the city, which had long been inhabited by people of Asiatic race, and found in it the cult of an ancient mother goddess who possibly bore the name of Oupis, and identified her with Artemis, a deity of their home land. The evidence of excavations shows that in the course of centuries several temples were erected on the same site in honour of the goddess. It was the fourth of these temples that was destroyed by a fire started by the crazy Herostratus in the year 356, during the night in which Alexander the Great was born. It was rebuilt, more magnificent than ever. With its concourse of priests, magicians and pilgrims, and with its shops in which amulets, mementoes and oblations were offered for sale, the commercial metropolis of Ephesus might be compared to a modern Lourdes.

In about A.D. 54, the apostle Paul spent several years at Ephesus. He preached, performed miracles, and found a large following among the people. He was persecuted and accused by the Jews; and he separated from them and founded an independent Christian community. In consequence of the spread of his doctrine, there was a falling-off in the trade of the goldsmiths, who used to make mementoes of the holy place - small figures of Artemis and models of the temple - for the faithful and the pilgrims who came from all over the world.¹ Paul was much too strict a Jew to allow the old deity to survive under another name, to re-baptize her, as the Ionic conquerors had done with the goddess Oupis. So it was that the pious artisans and artists of the city became uneasy about their goddess as well as about their earnings. They revolted, and, with endlessly repeated cries of ‘Great is Diana of the Ephesians’, streamed through the main street, called ‘Arcadian’, to the theatre, where their leader, Demetrius, delivered an incendiary speech against the Jews and against Paul. The authorities succeeded with difficulty in quelling the tumult by the assurance that the majesty of the goddess was unassailable and out of reach of any attack.²

¹ See also Goethe’s poem (*Sophienausgabe*, 2, 195).

² Acts, xix.

The church founded by Paul at Ephesus did not long remain faithful to him. It came under the influence of a man named John, whose personality has set the critics some hard problems. He may have been the author of the Apocalypse, which teems with invectives against the apostle Paul. Tradition identifies him with the apostle John, to whom the fourth gospel is attributed. According to that gospel, when Jesus was on the cross he called out to his favourite disciple, pointing to Mary: 'Behold thy mother!' And from that moment John took Mary to him. So when John went to Ephesus, Mary accompanied him. Accordingly, alongside of the church of the apostle in Ephesus, there was built the first basilica in honour of the new mother-goddess of the Christians. Its existence is attested as early as in the fourth century. Now once again the city had its great goddess, and, apart from her name, there was little change. The goldsmiths, too, recovered their work of making models of the temple and images of the goddess for the new pilgrims. The function of Artemis expressed by the attribute of *Κουροτρόφος*,¹ however, was handed over to a St. Artemidorus, who took on the care of women in labour.

Then came the conquest of the city by Islam, and finally its ruin and abandonment owing to the river on which it stood becoming choked with sand. But even then the great goddess of Ephesus had not abandoned her claims. In our own days she appeared as a saintly virgin to a pious German girl, Katharina Emmerich, at Dülmen. She described to her her journey to Ephesus, the furnishings of the house in which she had lived there and in which she had died, the shape of her bed, and so on. And both the house and the bed were in fact found exactly as the virgin had described them, and they are once more the goal of the pilgrimages of the faithful.

¹ ['Rearer of boys.']

PREFACE TO MAXIM STEINER'S
THE PSYCHICAL DISORDERS OF MALE POTENCY
(1913)

The author of this little monograph, which deals with the pathology and treatment of psychical impotence in males, is one of the small band of physicians who early recognized the importance of psycho-analysis for their special branch of medicine and who have never since ceased to perfect themselves in its theory and technique. We are aware that only a small part of neurotic ailments - which we have now come to know as the outcome of disturbances of the sexual function - are dealt with in neuropathology itself. The greater number of them find a place among the disorders of the particular organ which is the victim of a neurotic disturbance. It is therefore expedient and proper that the treatment of these symptoms or syndromes should also be the business of the specialist, who is alone capable of making a differential diagnosis between a neurotic and an organic illness, who can draw the line, in the case of mixed forms, between their organic and neurotic elements, and who can in general give us information on the way in which the two factors in the disease mutually reinforce each other. But if 'nervous' organic diseases are not to fall into neglect as being mere appendages of the material disorders of the same organ - a neglect which, from their frequency and practical importance, they are far from meriting - the specialist, whether he is concerned with the stomach, the heart or the urogenitary system, must, in addition to his general medical knowledge and his specialized attainments, also be able to make use, for his own field of work, of the lines of approach, the discoveries and the techniques of the nerve specialist.

A great therapeutic advance will have been made when specialists no longer dismiss a patient suffering from a nervous ailment in an organ with a pronouncement such as: 'There's nothing wrong with you; it's simply nerves', or with the not much better further advice: 'Go to a nerve specialist; he'll order you a light course of cold-water treatment.' No doubt, too, we shall require the specialist in any organ to be capable of understanding and treating nervous disorders in his field, rather than expect the nerve-specialist to be trained into being a universal specialist in every organ in which neuroses produce symptoms. And it may accordingly be anticipated that only neuroses with mainly psychical symptoms will remain in the sphere of the nerve specialist.

We may hope, therefore, that the time is not far distant when it will be generally recognized that no sort of nervous disturbance can be understood and treated without the help of the line of approach and often of the technique of psycho-analysis. Such an assertion may sound to-day like a piece of presumptuous exaggeration; but I venture to prophesy that it is destined to become a platitude. It will, however, always be to the credit of the author of the present work that he has not waited for this to happen before admitting psycho-analysis as a treatment of the nervous ailments within his own specialized branch of medicine.

VIENNA, *March* 1913.

TOTEM AND TABOO

Some Points of Agreement between the Mental Lives of Savages and Neurotics

(1913 [1912-13])

Intentionally left blank

PREFACE

The four essays that follow were originally published (under a heading which serves as the present book's sub-title) in the first two volumes of *Imago*, a periodical issued under my direction. They represent a first attempt on my part at applying the point of view and the findings of psycho-analysis to some unsolved problems of social psychology [*Völkerpsychologie*]. Thus they offer a methodological contrast on the one hand to Wilhelm Wundt's extensive work, which applies the hypotheses and working methods of *non-analytic* psychology to the same purposes, and on the other hand to the writings of the Zurich school of psycho-analysis, which endeavour, on the contrary, to solve the problems of individual psychology with the help of material derived from social psychology. (Cf. Jung, 1912 and 1913.) I readily confess that it was from these two sources that I received the first stimulus for my own essays.

I am fully conscious of the deficiencies of these studies. I need not mention those which are necessarily characteristic of pioneering work; but others require a word of explanation. The four essays collected in these pages aim at arousing the interest of a fairly wide circle of educated readers, but they cannot in fact be understood and appreciated except by those few who are no longer strangers to the essential nature of psycho-analysis. They seek to bridge the gap between students of such subjects as social anthropology, philology and folklore on the one hand, and psycho-analysts on the other. Yet they cannot offer to either side what each lacks - to the former an adequate initiation into the new psychological technique or to the latter a sufficient grasp of the material that awaits treatment. They must therefore rest content with attracting the attention of the two parties and with encouraging a belief that occasional co-operation between them could not fail to be of benefit to research.

It will be found that the two principal themes from which the title of this little book is derived - totems and taboos - have not received the same treatment. The analysis of taboos is put forward as an assured and exhaustive attempt at the solution of the problem. The investigation of totemism does no more than declare that 'here is what psycho-analysis can at the moment contribute towards elucidating the problem of the totem'. The difference is related to the fact that taboos still exist among us. Though expressed in a negative form and directed towards another subject-matter, they do not differ in their psychological nature from Kant's 'categorical imperative', which operates in a compulsive fashion and rejects any conscious motives. Totemism, on the contrary, is something alien to our contemporary feelings - a religio-social institution which has been long abandoned as an actuality and replaced by newer forms. It has left only the slightest traces behind it in the religions, manners and customs of the civilized peoples of to-day and has been subject to far-reaching modifications even among the races over which it still holds sway. The social and technical advances in human history have affected taboos far less than the totem.

An attempt is made in this volume to deduce the original meaning of totemism from the vestiges remaining of it in childhood from the hints of it which emerge in the course of the growth of our own children. The close connection between totems and taboos carries us a step further along the path towards the hypothesis presented in these pages; and if in the end that hypothesis bears a highly improbable appearance, that need be no argument against the possibility of its approximating more or less closely to the reality which it is so hard to reconstruct.

ROME, *September* 1913

PREFACE TO THE HEBREW TRANSLATION

No reader of this book will find it easy to put himself in the emotional position of an author who is ignorant of the language of holy writ, who is completely estranged from the religion of his fathers - as well as from every other religion - and who cannot take a share in nationalist ideals, but who has yet never repudiated his people, who feels that he is in his essential nature a Jew and who has no desire to alter that nature. If the question were put to him: 'Since you have abandoned all these common characteristics of your countrymen, what is there left to you that is Jewish?' he would reply: 'A very great deal, and probably its very essence.' He could not now express that essence clearly in words; but some day, no doubt, it will become accessible to the scientific mind.

Thus it is an experience of a quite special kind for such an author when a book of his is translated into the Hebrew language and put into the hands of readers for whom that historic idiom is a living tongue: a book, moreover, which deals with the origin of religion and morality, though it adopts no Jewish standpoint and makes no exceptions in favour of Jewry. The author hopes, however, that he will be at one with his readers in the conviction that unprejudiced science cannot remain a stranger to the spirit of the new Jewry.

VIENNA, *December* 1930

TOTEM AND TABOO

I

THE HORROR OF INCEST

Prehistoric man, in the various stages of his development, is known to us through the inanimate monuments and implements which he has left behind, through the information about his art, his religion and his attitude towards life which has come to us either directly or by way of tradition handed down in legends, myths and fairy tales, and through the relics of his mode of thought which survive in our own manners and customs. But apart from this, in a certain sense he is still our contemporary. There are men still living who, as we believe, stand very near to primitive man, far nearer than we do, and whom we therefore regard as his direct heirs and representatives. Such is our view of those whom we describe as savages or half-savages; and their mental life must have a peculiar interest for us if we are right in seeing in it a well-preserved picture of an early stage of our own development.

If that supposition is correct, a comparison between the psychology of primitive peoples, as it is taught by social anthropology, and the psychology of neurotics, as it has been revealed by psycho-analysis, will be bound to show numerous points of agreement and will throw new light upon familiar facts in both sciences.

For external as well as for internal reasons, I shall select as the basis of this comparison the tribes which have been described by anthropologists as the most backward and miserable of savages, the aborigines of Australia, the youngest continent, in whose fauna, too, we can still observe much that is archaic and that has perished elsewhere.

The Australian aborigines are regarded as a distinct race, showing neither physical nor linguistic relationship with their nearest neighbours, the Melanesian, Polynesian and Malayan peoples. They do not build houses or permanent shelters; they do not cultivate the soil; they keep no domesticated animals except the dog; they are not even acquainted with the art of making pottery. They live entirely upon the flesh of all kinds of animals which they hunt, and upon roots which they dig. Kings or chiefs are unknown among them; communal affairs are decided by a council of elders. It is highly doubtful whether any religion, in the shape of a worship of higher beings, can be attributed to them. The tribes in the interior of the continent, who have to struggle against the hardest conditions of existence as a result of the scarcity of water, appear to be more primitive in all respects than those living near the coast.

We should certainly not expect that the sexual life of these poor naked cannibals would be moral in our sense or that their sexual instincts would be subjected to any great degree of restriction. Yet we find that they set before themselves with the most scrupulous care and the most painful severity the aim of avoiding incestuous sexual relations. Indeed, their whole social organization seems to serve that purpose or to have been brought into relation with its attainment.

Among the Australians the place of all the religious and social institutions which they lack is taken by the system of 'totemism'. Australian tribes fall into smaller divisions, or clans, each of which is named after its totem. What is a totem? It is as a rule an animal (whether edible and harmless or dangerous and feared) and more rarely a plant or a natural phenomenon (such as rain or water), which stands in a peculiar relation to the whole clan. In the first place, the totem is the common ancestor of the clan; at the same time it is their guardian spirit and helper, which sends them oracles and, if dangerous to others, recognizes and spares its own children. Conversely, the clansmen are under a sacred obligation (subject to automatic sanctions) not to kill or destroy their totem and to avoid eating its flesh (or deriving benefit from it in other ways). The totemic character is inherent, not in some individual animal or entity, but in all the individuals of a given class. From time to time festivals are celebrated at which the clansmen represent or imitate the motions and attributes of their totem in ceremonial dances.

The totem may be inherited either through the female or through the male line. It is possible that originally the former method of descent prevailed everywhere and was only subsequently replaced by the latter. An Australian's relation to his totem is the basis of all his social obligations: it overrides on the one hand his tribal membership and on the other hand his blood relationships.¹

The totem is not attached to one particular place. The clansmen are distributed in different localities and live peacefully side by side with members of other totem clans.²

¹ 'The Totem bond is stronger than the bond of blood or family in the modern sense.' (Frazer, 1910, 1, 53.)

² This highly condensed summary of the totemic system must necessarily be subject to further comments and qualifications. The word 'totem' was first introduced in 1791 (in the form 'totam') from the North American Indians by an Englishman, J. Long. The subject itself has gradually attracted great scientific interest and has produced a copious literature, from which I may select as works of capital importance J. G. Frazer's four-volume *Totemism and Exogamy* (1910) and the writings of Andrew Lang, e.g. *The Secret of the Totem* (1905). The merit of having been the first to recognize the importance of totemism for human prehistory lies with a Scotsman, John Ferguson McLennan (1869-70). Totemic institutions were, or still are, to be observed in operation, not only among the Australians, but also among the North American Indians, among the peoples of Oceania, in the East Indies and in a large part of Africa. It may also be inferred from certain vestigial remains, for which it is otherwise hard to account, that totemism existed at one time among the Aryan and Semitic aboriginal races of Europe and Asia. Many investigators are therefore inclined to regard it as a necessary phase of human development which has been passed through universally.

How did prehistoric men come to adopt totems? How, that is, did they come to make the fact of their being descended from one animal or another the basis of their social obligations and, as we shall see presently, of their sexual restrictions? There are numerous theories on the subject - of which Wundt (1906) has given an epitome for German readers - but no agreement. It is my intention to devote a special study before long to the problem of totemism, in which I shall attempt to solve it by the help of a psycho-analytic line of approach. (See the fourth essay in this work.)

Not only, however, is the *theory* of totemism a matter of dispute; the facts themselves are scarcely capable of being expressed in general terms as I have tried to do in the text above. There is scarcely a statement which does not call for exceptions or contradictions. But it must not be forgotten that even the most primitive and conservative races are in some sense *ancient* races and have a long past history behind them during which their original conditions of life have been subject to much development and distortion. So it comes about that in those races in which totemism exists to-day, we may find it in various stages of decay and disintegration or in the process of transition to other social and religious institutions, or again in a stationary condition which may differ greatly from the original one. The difficulty in this last case is to decide whether we should regard the present state of things as a true picture of the significant features of the past or as a secondary distortion of them.

And now we come at last to the characteristic of the totemic system which has attracted the interest of psycho-analysts. In almost every place where we find totems we also find *a law against persons of the same totem having sexual relations with one another and consequently against their marrying*. This, then, is 'exogamy', an institution related to totemism.

Strictly enforced as it is, this prohibition is a remarkable one. There is nothing in the concept or attributes of the totem which I have so far mentioned to lead us to anticipate it; so that it is hard to understand how it has become involved in the totemic system. We cannot, therefore, feel surprised that some investigators actually suppose that exogamy had originally - in the earliest times and in its true meaning - nothing to do with totemism, but became attached to it (without there being any underlying connection) at some time when marriage restrictions became necessary. However this may be, the bond between totemism and exogamy exists and is clearly a very firm one.

Some further considerations will make the significance of this prohibition clearer:

(a) The violation of the prohibition is not left to what might be called the 'automatic' punishment of the guilty parties, as in the case of other totem prohibitions, such as that against killing the totem animal. It is avenged in the most energetic fashion by the whole clan, as though it were a question of averting some danger that threatened the whole community or some guilt that was pressing upon it. A few sentences from Frazer (1910, 1, 54) will show how severely such misdeeds are treated by savages who are otherwise far from being moral by our standards:

'In Australia the regular penalty for sexual intercourse with a person of a forbidden clan is death. It matters not whether the woman be of the same local group or has been captured in war from another tribe; a man of the wrong clan who uses her as his wife is hunted down and killed by his clansmen, and so is the woman; though in some cases, if they succeed in eluding capture for a certain time, the offence may be condoned. In the Ta-ta-thi tribe, New South Wales, in the rare cases which occur, the man is killed but the woman is only beaten or speared, or both, till she is nearly dead; the reason given for not actually killing her being that she was probably coerced. Even in casual amours the clan prohibitions are strictly observed; any violations of these prohibitions "are regarded with the utmost abhorrence and are punished by death".'

(b) Since the same severe punishment is inflicted in the case of passing love-affairs which have not resulted in any children, it seems unlikely that the reasons for the prohibition are of a practical nature.

(c) Since totems are hereditary and not changed by marriage, it is easy to follow the consequences of the prohibition. Where, for instance, descent is through the female line, if a man of the Kangaroo totem marries a woman of the Emu totem, all the children, both boys and girls, belong to the Emu clan. The totem regulation will therefore make it impossible for a son of this marriage to have incestuous intercourse with his mother or sisters, who are Emus like himself.¹

¹ On the other hand, at all events so far as this prohibition is concerned, the father, who is a Kangaroo, is free to commit incest with his daughters, who are Emus. If the totem descended through the *male* line, however, the Kangaroo father would be prohibited from incest with his daughters (since all his children would be Kangaroos), whereas the son would be free to commit incest with his mother. These implications of totem prohibitions suggest that descent through the female line is older than that through the male, since there are grounds for thinking that totem prohibitions were principally directed against the incestuous desires of the son.

(d) But a little more reflection will show that exogamy linked with the totem effects more (and therefore *aims at more*) than the prevention of incest with a man's mother and sisters. It makes sexual intercourse impossible for a man with all the women of his own clan (that is to say with a number of women who are not his blood-relatives) by treating them all as though they *were* his blood-relatives. It is difficult at first sight to see the psychological justification for this very extensive restriction, which goes far beyond anything comparable among civilized peoples. It may be gathered from this, however, that the part played by the totem as common ancestor is taken very seriously. All those who are descended from the same totem are blood relations. They form a single family, and within that family even the most distant degree of kinship is regarded as an absolute hindrance to sexual intercourse.

We see, then, that these savages have an unusually great horror of incest, or are sensitive on the subject to an unusual degree, and that they combine this with a peculiarity which remains obscure to us - of replacing real blood-relationship by totem kinship. This latter contrast must not, however, be too much exaggerated, and we must remember that the totem prohibitions include that against real incest as a special case.

The riddle of how it came about that the real family was replaced by the totem clan must perhaps remain unsolved till the nature of the totem itself can be explained. At the same time, it is to be observed that if there were a certain degree of freedom of sexual intercourse outside marriage, blood-relationship, and consequently the prevention of incest, would become so uncertain that the prohibition would stand in need of a wider basis. It is therefore worth remarking that Australian customs permit the occurrence, in certain social situations and during certain festivals, of breaches in a man's exclusive conjugal rights over a woman.

Linguistic usage in these Australian tribes¹ exhibits a peculiarity which is no doubt relevant here. For the terms used by them to express the various degrees of kinship do not denote a relation between two individuals but between an individual and a group. This is what L. H. Morgan named the 'classificatory' system of relationship. Thus a man uses the term 'father' not only for his actual procreator but also for all the other men whom his mother might have married according to tribal law and who therefore might have procreated him; he uses the term 'mother' not only for the woman who actually bore him but also for all the other women who might have borne him without transgressing the tribal law; he uses the terms 'brother' and 'sister' not only for the children of his actual parents but also for the children of all those persons who stand in the relation of parents to him in the classificatory sense; and so on. Thus the kinship terms which two Australians apply to each other do not necessarily indicate any consanguinity, as ours would do: they represent social rather than physical relationships. Something approaching the classificatory system is to be found among us when, for instance, children are encouraged to refer to all their parents' friends as 'Uncle' or 'Aunt', or when we speak in a metaphorical sense of 'brothers in Apollo' or 'sisters in Christ'.

¹ As well as in most other totemic communities.

Though this use of words strikes us as so puzzling, it is easily explained if we look on it as a survival of the marriage institution which the Rev. L. Fison has called 'group marriage' and which consists in a certain number of men exercising conjugal rights over a certain number of women. The children of such a group marriage would then justly regard one another as brothers and sisters (though they were not all born of the same mother) and would regard all the men in the group as their fathers.

Though some authors, such as Westermarck (1901), have disputed the conclusions which others have drawn from the existence of the classificatory system of relationship, those who have the closest acquaintance with the Australian natives are agreed in regarding that system as a survival from the days of group marriage. Indeed, according to Spencer and Gillen (1899), a certain form of group marriage exists to this day in the Urabunna and Dieri tribes. Group marriage thus preceded individual marriage among these peoples, and after its disappearance left definite traces behind both in language and customs.

But when once we have put group marriage in the place of individual marriage, the apparently excessive degree of avoidance of incest which we have come across among the same peoples becomes intelligible. Totemic exogamy, the prohibition of sexual intercourse between members of the same clan, appears to have been the appropriate means for preventing group incest; it thus became established and persisted long after its *raison d'être* had ceased.

It may seem that we have thus discovered the motives the led the Australian natives to set up their marriage restrictions; but we have now to learn that the actual state of affairs reveals a far greater, and at first sight a bewildering, complexity. For there are few races in Australia in which the totem barrier is the sole prohibition. Most of them are organized in such a way as to fall into two divisions, known as marriage-classes or 'phratries'. Each of these phratries is exogamous and comprises a number of totem clans. As a rule each phratry is further subdivided into two 'sub-phratries', the whole tribe being thus divided into four, with the sub-phratries intermediate between the phratries and the totem clans.

The following diagram represents the typical organization of an Australian tribe and corresponds to the actual situation in very large number of cases:

Here the twelve totem clans are divided into four sub-phratries and two phratries. All the divisions are exogamous.¹ Sub-phratries c and e form an exogamous unit; and so also do sub-phratries d and f. The result (and therefore the purpose) of these arrangements cannot be doubted: they bring about a still further restriction on the choice of marriage and on sexual liberty. Let us suppose that each clan contains an equal number of members. Then, if only the twelve totem clans existed, each member of a clan would have his choice among 11/12 of all the women in the tribe. The existence of the two phratries reduces his choice to 6/12 or 1/2, for then a man of totem α can only marry a woman of totems 1 to 6. With the introduction of the four sub-phratries his choice is still further reduced to 3/12 or 1/4, for in that case a man of totem α is restricted in his choice of a wife to a woman of totems 4, 5 or 6.

¹ The number of totems is chosen arbitrarily.

The historical relation between the marriage-classes (of which in some tribes there are as many as eight) and the totem clans is completely obscure. It is merely evident that these arrangements are directed towards the same aim as totemic exogamy and pursue it still further. While, however, totemic exogamy gives one the impression of being a sacred ordinance of unknown origin - in short, of being a custom - the complicated institution of the marriage-classes, with their subdivisions and the regulations attaching to them, look more like the result of deliberate legislation, which may perhaps have taken up the task of preventing incest afresh because the influence of the totem was waning. And, while the totemic system is, as we know, the basis of all the other social obligations and moral restrictions of the tribe, the significance of the phratries seems in general not to extend beyond the regulation of marriage choice which is its aim.

The system of marriage-classes in its furthest developments bears witness to an endeavour to go beyond the prevention of natural and group incest and to forbid marriage between still more distant groups of relatives. In this it resembles the Catholic Church, which extended the ancient prohibition against marriage between brothers and sisters to marriage between cousins and even to marriage between those who were merely spiritual relatives. (Cf. Lang, 1910-11.)

It would be little to our purpose if we were to follow in detail the extraordinarily involved and obscure discussions on the origin and significance of the marriage-classes and on their relation to the totem. For our purpose it is enough to draw attention to the great care which is devoted by the Australians, as well as by other savage peoples, to the prevention of incest.¹ It must be admitted that these savages are even more sensitive on the subject of incest than we are. They are probably liable to a greater temptation to it and for that reason stand in need of fuller protection.

¹ Storfer (1911) has quite recently insisted on this point.

But the horror of incest shown by these peoples is not satisfied by the erection of the institutions which I have described and which seem to be directed principally against group incest. We must add to them a number of 'customs' which regulate the dealings of individuals with their near relatives in our sense of the term, customs which are enforced literally with religious strictness and the purpose of which can scarcely be doubted. These customs or customary prohibitions have been termed 'avoidances'. They extend far beyond the totemic races of Australia; but once again I must ask my readers to be content with a fragmentary extract from the copious material.

In Melanesia restrictive prohibitions of this sort govern a boy's intercourse with his mother and sisters. Thus, for instance, in Lepers' Island, one of the New Hebrides, when a boy has reached a certain age he no longer lives at home, but takes up his quarters in the 'club-house', where he now regularly eats and sleeps. It is true that he may still go to his father's house to ask for food, but if his sister is at home he must go away before eating; if no sister is there he may sit down near the door and eat. If by chance a brother and sister meet in the open, she must run away or hide. If a boy knows that certain footprints in the road are his sister's, he will not follow them, nor will she follow his. Indeed, he will not even utter her name, and will avoid the use of a common word if it forms part of her name. This avoidance begins with the puberty ceremonies and is maintained throughout life. The reserve between a son and his mother increases as the boy grows up and is much more on her side than on his. If his mother brings him food, she does not give it him but puts it down for him to take. In speaking to him she does not *tutoyer* him, but uses the more distant plural forms.¹

Similar customs prevail in New Caledonia. If a brother and sister happen to meet on a path, the sister will throw herself into the bushes and he will pass on without turning his head.

Among the natives of the Gazelle Peninsula in New Britain a sister, after her marriage, is not allowed to converse with her brother; she never utters his name, but designates him by another word.²

¹ Frazer (1910, 2, 77 f.), quoting Codrington (1891).

² Frazer (1910, 2, 124).

In New Mecklenburg cousins of one kind are subject to similar restrictions, as are brothers and sisters. They may not come near each other, may not shake hands and may not give each other presents; but they are allowed to speak to each other at a distance of some paces. The penalty for incest with a sister is death by hanging.¹

In Fiji these avoidance rules are particularly strict; they affect not only blood sisters but tribal sisters as well. It must strike us as all the more puzzling to hear that these same savages practise sacred orgies, in which precisely these forbidden degrees of kinship seek sexual intercourse - puzzling, that is, unless we prefer to regard the contrast as an explanation of the prohibition.²

Among the Battas of Sumatra the rules of avoidance apply to all near relations. 'A Batta, for example, would think it shocking were a brother to escort his sister to an evening party. Even in the presence of others a Batta brother and sister feel embarrassed. If one of them comes into the house, the other will go away. Further, a father may never be alone in the house with his daughter, nor a mother with her son. . . . The Dutch missionary who reports these customs adds that he is sorry to say that from what he knows of the Battas he believes the maintenance of most of these rules to be very necessary.' These people assume as a matter of course that a solitary meeting between a man and a woman will lead to an improper intimacy between them. And since they believe that intercourse between near relations will lead to punishments and calamities of all sorts, they are right to avoid any temptation to transgress these prohibitions.³

Curiously enough, among the Barongo of Delagoa Bay, in South Africa, the strictest rules affect a man's relations with his sister-in-law, the wife of his wife's brother. If he meets this formidable person anywhere, he carefully avoids her. He does not eat out of the same dish with her, he speaks to her with embarrassment, does not venture into her hut and greets her in a trembling voice.⁴

¹ Frazer (1910, 2, 130 f.), quoting Peckel (1908).

² Frazer (1910, 2, 146 ff.), quoting Fison.

³ Frazer (1910, 2, 189).

⁴ Frazer (1910, 2, 388), quoting Junod.

A rule of avoidance with which one would have expected to meet more frequently operates among the A-kamba (or Wa kamba) of British East Africa. A girl has to avoid her father between the age of puberty and the time of her marriage. If they meet in the road, she hides while he passes, and she may never go and sit near him. This holds good until the moment of her betrothal. After her marriage she does not avoid her father in any way.¹

By far the most widespread and strictest avoidance (and the most interesting from the point of view of civilized races) is that which restricts a man's intercourse with his mother-in-law. It is quite general in Australia and also extends over Melanesia, Polynesia and the Negro races of Africa, wherever traces of totemism and the classificatory system of relationship are found and probably still further. In some of these places there are similar prohibitions against a woman having innocent intercourse with her father-in-law; but they are far less usual and severe. In a few isolated cases both parents-in-law are subject to avoidance. Since we are less concerned with the ethnographical extent of this avoidance than with its substance and purpose, I shall once again restrict myself to quoting a few examples.

Among the Melanesians of the Banks' Islands 'these rules of avoidance are very strict and minute. A man will not come near his wife's mother and she will not come near him. If the two chance to meet in a path, the woman will step out of it and stand with her back turned till he has gone by, or perhaps, if it be more convenient, he will move out of the way. At Vanua Lava, in Port Patteson, a man would not even follow his mother-in-law along the beach until the rising tide had washed her foot prints from the sand. Yet a man and his mother-in-law may talk to each other at a distance; but a woman will on no account mention the name of her daughter's husband, nor will he name hers.'²

In the Solomon Islands, after his marriage a man may neither see nor converse with his mother-in-law. If he meets her, he may not recognize her, but must make off and hide himself as fast as he can.³

¹ Frazer (1910, 2, 424).

² Frazer (1910, 2, 76)

³ Frazer (1910, 2, 117), quoting Ribbe (1903).

Among the Eastern Bantu 'custom requires that a man should "be ashamed of" his wife's mother, that is to say, he must studiously shun her society. He may not enter the same hut with her, and if by chance they meet on a path, one or other turns aside, she perhaps hiding behind a bush, while he screens his face with a shield. If they cannot thus avoid each other, and the mother-in-law has nothing else to cover herself with, she will tie a wisp of grass round her head as a token of ceremonial avoidance. All correspondence between the two has to be carried on either through a third party or by shouting to each other at a distance with some barrier, such as the kraal fence, interposed between them. They may not even pronounce each other's proper name.' (Frazer, 1910, 2, 385.)

Among the Basoga, a Bantu people who live in the region of the sources of the Nile, a man may only speak to his mother-in-law when she is in another room and out of sight. Incidentally, these people have such a horror of incest that they punish it even when it occurs among their domestic animals. (Frazer, 1910, 2, 461.)

While there can be no doubt as to the purpose and significance of the other avoidances between near relations, and they are universally regarded as protective measures against incest, the prohibitions affecting a man's intercourse with his mother-in law have received another interpretation in some quarters. It was with justice regarded as incomprehensible that all these different peoples should feel such great fear of the temptation presented to a man by an elderly woman, who might have been, but in fact was not, his mother. (Crawley, 1902, 405.)

This objection was also raised against the view put forward by Fison. He pointed out that certain systems of marriage-classes had gaps in them, as a result of which marriage between a man and his mother-in-law was not theoretically impossible. For that reason, he suggested, a special guarantee against that possibility became necessary.

Sir John Lubbock (1870) traced back the attitude of a mother-in-law to her son-in-law to the institution of 'marriage by capture'. 'When the capture was a reality', he writes, 'the indignation of the parents would also be real; when it became a mere symbol, the parental anger would be symbolized also, and would be continued even after its origin was forgotten.' Crawley has no difficulty in showing how insufficiently this attempted explanation covers the details of the observed facts.

Tylor believes that the treatment given to a son-in-law by his mother-in-law is merely a form of 'cutting' or non-recognition by the wife's family: the man is regarded as an 'outsider' until the first child is born. In the first place, however, the prohibition is not always brought to an end when this occurs. But, apart from this, it may be objected that this explanation throws no light on the fact that the prohibition centres particularly on the *mother-in-law* - that the explanation overlooks the factor of sex. Moreover, it takes no account of the attitude of religious horror expressed in the prohibition. (Crawley, 1902, 407.)

A Zulu woman, questioned as to the basis of the prohibition, gave the sensitive reply: 'It is not right that he should see the breasts which suckled his wife.'¹

As we know, the relation between son-in-law and mother-in-law is also one of the delicate points of family organization in *civilized* communities. That relation is no longer subject to rules of avoidance in the social system of the white peoples of Europe and America; but many disputes and much unpleasantness could often be eliminated if the avoidance still existed as a custom and did not have to be re-erected by individuals. It may be regarded by some Europeans as an act of high wisdom on the part of these savage races that by their rules of avoidance they entirely precluded any contact between two persons brought into this close relationship to each other. There is scarcely room for doubt that something in the psychological relation of a mother-in-law to a son-in-law breeds hostility between them and makes it hard for them to live together. But the fact that in civilized societies mothers-in-law are such a favourite subject for jokes seems to me to suggest that the emotional relation involved includes sharply contrasted components. I believe, that is, that this relation is in fact an 'ambivalent' one, composed of conflicting affectionate and hostile impulses.

¹ Crawley (1902, 401), quoting Leslie (1875).

Some of those impulses are obvious enough. On the side of the mother-in-law there is reluctance to give up the possession of her daughter, distrust of the stranger to whom she is to be handed over, an impulse to retain the dominating position which she has occupied in her own house. On the man's side there is a determination not to submit any longer to someone else's will, jealousy of anyone who possessed his wife's affection before he did, and, last but not least, an unwillingness to allow anything to interfere with the illusory overvaluation bred of his sexual feelings. The figure of his mother-in-law usually causes such an interference, for she has many features which remind him of her daughter and yet lacks all the charms of youth, beauty and spiritual freshness which endear his wife to him.

But we are able to bring forward other motives than these, thanks to the knowledge of concealed mental impulses which we have acquired from the psycho-analytic examination of individual human beings. A woman whose psychosexual needs should find satisfaction in her marriage and her family life is often threatened with the danger of being left unsatisfied, because her marriage relation has come to a premature end and because of the uneventfulness of her emotional life. A mother, as she grows older, saves herself from this by putting herself in her children's place, by identifying herself with them; and this she does by making their emotional experiences her own. Parents are said to stay young with their children, and that is indeed one of the most precious psychological gains that parents derive from their children. Where a marriage is childless, the wife has lost one of the things which might be of most help to her in tolerating the resignation that her own marriage demands from her. A mother's sympathetic identification with her daughter can easily go so far that she herself falls in love with the man her daughter loves; and in glaring instances this may lead to severe forms of neurotic illness as a result of her violent mental struggles against this emotional situation. In any case, it very frequently happens that a mother-in-law is subject to an *impulse* to fall in love in this way, and this impulse itself or an opposing trend are added to the tumult of conflicting forces in her mind. And very often the unkind, sadistic components of her love are directed on to her son-in-law in order that the forbidden, affectionate ones may be the more severely suppressed.

A man's relation to his mother-in-law is complicated by similar impulses, though they have another source. It is regularly found that he chose his mother as the object of his love, and perhaps his sister as well, before passing on to his final choice. Because of the barrier that exists against incest, his love is deflected from the two figures on whom his affection was centred in his childhood on to an outside object that is modelled upon them. The place of his own and his sister's mother is taken by his mother-in-law. He has an impulse to fall back upon his original choice, though everything in him fights against it. His horror of incest insists that the genealogical history of his choice of an object for his love shall not be recalled. His repudiation of this impulse is also facilitated by the fact that his mother-in-law is only a contemporary figure; he has not known her all his life, so that there is no unchangeable picture of her preserved in his unconscious. A streak of irritability and malevolence that is apt to be present in the medley of his feelings leads us to suspect that she does in fact offer him a temptation to incest; and this is confirmed by the not uncommon event of a man openly falling in love with the woman who is later to be his mother-in-law before transferring his love to her daughter.

I can see nothing against the presumption that it is precisely this incestuous factor in the relation that provides savages with the motive for their rules of avoidance between son-in-law and mother-in-law. Thus the explanation which we should adopt for these strictly enforced avoidances among primitive peoples is that put forward by Fison, which regards them merely as a further protection against possible incest. The same explanation holds good of all other avoidances, between both blood and tribal relations. The only difference would be that in the case of blood relations the possibility of incest is an immediate one and the intention to prevent it may be conscious; in the other cases, including that of a man's relation to his mother-in-law, the possibility of incest would seem to be a temptation in phantasy set in motion through the agency of unconscious connecting links.

There has been little opportunity in the preceding pages for showing how new light can be thrown upon the facts of social psychology by the adoption of a psycho-analytic method of approach: for the horror of incest displayed by savages has long been recognized as such and stands in need of no further interpretation. All that I have been able to add to our understanding of it is to emphasize the fact that it is essentially an *infantile* feature and that it reveals a striking agreement with the mental life of neurotic patients. Psycho-analysis has taught us that a boy's earliest choice of objects for his love is incestuous and that those objects are forbidden ones - his mother and his sister. We have learnt, too, the manner in which, as he grows up, he liberates himself from this incestuous attraction. A neurotic, on the other hand, invariably exhibits some degree of psychical infantilism. He has either failed to get free from the psychosexual conditions that prevailed in his childhood or he has returned to them - two possibilities which may be summed up as developmental inhibition and regression. Thus incestuous fixations of libido continue to play (or begin once more to play) the principal part in his unconscious mental life. We have arrived at the point of regarding a child's relation to his parents, dominated as it is by incestuous longings, as the nuclear complex of neurosis. This revelation of the importance of incest in neurosis is naturally received with universal scepticism by adults and normal people. Similar expressions of disbelief, for instance, inevitably greet the writings of Otto Rank, which have brought more and more evidence to show the extent to which the interest of creative writers centres round the theme of incest and how the same theme, in countless variations and distortions, provides the subject-matter of poetry. We are driven to believe that this rejection is principally a product of the distaste which human beings feel for their early incestuous wishes, now over taken by repression. It is therefore of no small importance that we are able to show that these same incestuous wishes, which are later destined to become unconscious, are still regarded by savage peoples as immediate perils against which the most severe measures of defence must be enforced.

II

TABOO AND EMOTIONAL AMBIVALENCE

(1)

'Taboo' is a Polynesian word. It is difficult for us to find a translation for it, since the concept connoted by it is one which we no longer possess. It was still current among the ancient Romans, whose '*sacer*' was the same as the Polynesian 'taboo'. So, too, the '*ἄγος*' of the Greeks and the '*kadesh*' of the Hebrews must have had the same meaning as is expressed in 'taboo' by the Polynesians and in analogous terms by many other races in America, Africa (Madagascar) and North and Central Asia.

The meaning of 'taboo', as we see it, diverges in two contrary directions. To us it means, on the one hand, 'sacred', 'consecrated', and on the other 'uncanny', 'dangerous', 'forbidden', 'unclean'. The converse of 'taboo' in Polynesian is '*noa*', which means 'common' or 'generally accessible'. Thus 'taboo' has about it a sense of something unapproachable, and it is principally expressed in prohibitions and restrictions. Our collocation 'holy dread' would often coincide in meaning with 'taboo'.

Taboo restrictions are distinct from religious or moral prohibitions. They are not based upon any divine ordinance, but may be said to impose themselves on their own account. They differ from moral prohibitions in that they fall into no system that declares quite generally that certain abstinences must be observed and gives reasons for that necessity. Taboo prohibitions have no grounds and are of unknown origin. Though they are unintelligible to us, to those who are dominated by them they are taken as a matter of course.

Wundt (1906, 308) describes taboo as the oldest human unwritten code of laws. It is generally supposed that taboo is older than gods and dates back to a period before any kind of religion existed.

Since we need an impartial account of taboo to submit to psycho-analytic examination, I shall now give some extracts and summaries of portions of the article 'Taboo' in the *Encyclopaedia Britannica* (1910-11),¹ the author of which was Northcote W. Thomas, the anthropologist.

'Properly speaking taboo includes only (a) the sacred (or unclean) character of person or things, (b) the kind of prohibition which results from this character, and (c) the sanctity (or uncleanness) which results from a violation of the prohibition. The converse of taboo in Polynesia is *noa* and allied forms, which mean "general" or "common". . . .

'Various classes of taboo in the wider sense may be distinguished: (i) natural or direct, the result of *mana* (mysterious power) inherent in a person or thing; (ii) communicated or indirect, equally the result of *mana*, but (a) acquired or (b) imposed by a priest, chief or other person; (iii) intermediate, where both factors are present, as in the appropriation of a wife to her husband. . . .' The term is also applied to other ritual restrictions, but what is better described as a 'religious interdiction' should not be referred to as taboo.

'The objects of taboo are many: (i) direct taboos aim at (a) the protection of important persons-chiefs, priests, etc. - and things against harm; (b) the safeguarding of the weak - women, children and common people generally - from the powerful *manas* (magical influence) of chiefs and priests; (c) the provision against the dangers incurred by handling or coming in contact with corpses, by eating certain foods, etc.; (d) the guarding the chief acts of life - birth, initiation, marriage and sexual functions, etc., against interference; (e) the securing of human beings against the wrath or power of gods and spirits;² (f) the securing of unborn infants and young children, who stand in a specially sympathetic relation with one or both parents, from the consequences of certain actions, and more especially from the communication of qualities supposed to be derived from certain foods. (ii) Taboos are imposed in order to secure against thieves the property of an individual, his fields, tools, etc. . . .'

¹ This includes a bibliography of the chief literature on the subject.

² In the present context this use of the term 'taboo' may be disregarded as not being a primary one.

The punishment for the violation of a taboo was no doubt originally left to an internal, automatic agency: the violated taboo itself took vengeance. When, at a later stage, ideas of gods and spirits arose, with whom taboo became associated, the penalty was expected to follow automatically from the divine power. In other cases, probably as a result of a further evolution of the concept, society itself took over the punishment of offenders, whose conduct had brought their fellows into danger. Thus the earliest human penal systems may be traced back to taboo.

‘The violation of a taboo makes the offender himself taboo. . . .’ Certain of the dangers brought into existence by the violation may be averted by acts of atonement and purification.

The source of taboo is attributed to a peculiar magical power which is inherent in persons and spirits and can be conveyed by them through the medium of inanimate objects. ‘Persons or things which are regarded as taboo may be compared to objects charged with electricity; they are the seat of a tremendous power which is transmissible by contact, and may be liberated with destructive effect if the organisms which provoke its discharge are too weak to resist it; the result of a violation of a taboo depends partly on the strength of the magical influence inherent in the taboo object or person, partly on the strength of the opposing *mana* of the violator of the taboo. Thus, kings and chiefs are possessed of great power, and it is death for their subjects to address them directly; but a minister or other person of greater *mana* than common can approach them unharmed, and can in turn be approached by their inferiors without risk. . . . So too indirect taboos depend for their strength on the *mana* of him who imposes them; if it is a chief or a priest, they are more powerful than those imposed by a common person. . . .’

It is no doubt the transmissibility of taboo which accounts for the attempts to throw it off by suitable purificatory ceremonies.

Taboos may be permanent or temporary. Among the former are those attaching to priests and chiefs, as well as to dead persons and anything belonging to them. Temporary taboos may be attached to certain particular states, such as menstruation and child-birth, to warriors before and after an expedition, or to special activities such as fishing and hunting. A general taboo may (like a Papal Interdict) be imposed upon a whole region and may then last for many years.

If I judge my readers' feelings aright, I think it is safe to say that in spite of all that they have now heard about taboo they still have very little idea of the meaning of the term or of what place to give it in their thoughts. This is no doubt due to the insufficiency of the information I have given them and to my having omitted to discuss the relation between taboo and superstition, the belief in spirits, and religion. On the other hand, I am afraid a more detailed account of what is known about taboo would have been even more confusing, and I can assure them that in fact the whole subject is highly obscure.

What we are concerned with, then, is a number of prohibitions to which these primitive races are subjected. Every sort of thing is forbidden; but they have no idea why, and it does not occur to them to raise the question. On the contrary, they submit to the prohibitions as though they were a matter of course and feel convinced that any violation of them will be automatically met by the direst punishment. We have trustworthy stories of how any unwitting violation of one of these prohibitions is in fact automatically punished. An innocent wrong-doer, who may, for instance, have eaten a forbidden animal, falls into a deep depression, anticipates death and then dies in real earnest. These prohibitions are mainly directed against liberty of enjoyment and against freedom of movement and communication. In some cases they have an intelligible meaning and are clearly aimed at abstinences and renunciations. But in other cases their subject-matter is quite incomprehensible; they are concerned with trivial details and seem to be of a purely ceremonial nature.

Behind all these prohibitions there seems to be something in the nature of a theory that they are necessary because certain persons and things are charged with a dangerous power, which can be transferred through contact with them, almost like an infection. The *quantity* of this dangerous attribute also plays a part. Some people or things have more of it than others and the danger is actually proportional to the difference of potential of the charges. The strangest fact seems to be that anyone who has transgressed one of these prohibitions himself acquires the characteristic of being prohibited - as though the whole of the dangerous charge had been transferred over to him. This power is attached to all *special* individuals, such as kings, priests or new born babies, to all *exceptional* states, such as the physical states of menstruation, puberty or birth, and to all *uncanny* things, such as sickness and death and what is associated with them through their power of infection or contagion.

The word 'taboo' denotes everything, whether a person or a place or a thing or a transitory condition, which is the vehicle or source of this mysterious attribute. It also denotes the prohibitions arising from the same attribute. And, finally, it has a connotation which includes alike 'sacred' and 'above the ordinary', as well as 'dangerous', 'unclean' and 'uncanny'.

This word and the system denoted by it give expression to a group of mental attitudes and ideas which seem remote indeed from our understanding. In particular, there would seem to be no possibility of our coming into closer contact with them without examining the belief in ghosts and spirits which is characteristic of these low levels of culture.

Why, it may be asked at this point, should we concern ourselves at all with this riddle of taboo? Not only, I think, because it is worth while trying to solve *any* psychological problem for its own sake, but for other reasons as well. It may begin to dawn on us that the taboos of the savage Polynesians are after all not so remote from us as we were inclined to think at first, that the moral and conventional prohibitions by which we ourselves are governed may have some essential relationship with these primitive taboos and that an explanation of taboo might throw a light upon the obscure origin of our own 'categorical imperative'.

Accordingly, we shall be particularly interested to hear the views of so notable an investigator as Wilhelm Wundt on the subject of taboo, especially as he promises 'to trace back the concept of taboo to its earliest roots' (1906, 301).

Wundt writes of that concept that 'it comprises all of the usages in which is expressed a dread of certain objects related to cult ideas or of actions connected with them'. (Ibid., 237.) And, in another passage: 'If we understand by it, in accordance with the general meaning of the word, every prohibition (whether laid down in usage or custom or in explicitly formulated laws) against touching an object or making use of it for one's own purposes or against using certain proscribed words . . . ' then, he goes on, there can be no race and no level of culture which has escaped the ill-effects of taboo.

Wundt next proceeds to explain why it seems to him advisable to study the nature of taboo in the primitive conditions of the Australian savages rather than in the higher culture of the Polynesian peoples. He divides the taboo prohibition among the Australians into three classes, according as they affect animals, human beings or other objects. The taboos on animals, which consist essentially of prohibitions against killing and eating them, constitute the nucleus of *Totemism*.¹ The second class of taboos, those directed towards human beings, are of an entirely different kind. They are restricted in the first instance to circumstances in which the person on whom the taboo is imposed finds himself in an unusual situation. Thus young men are taboo at their initiation ceremonies, women are taboo during menstruation and immediately after giving birth; so too new-born babies, sick persons and, above all, the dead are taboo. A man's property which is in his constant use is permanently taboo to all other men: his clothing, for instance, his tools and weapons. Included in a man's most personal property, in Australia, is the new name which he received when he was a boy at his initiation. It is taboo and must be kept secret. The third class of taboos, which are imposed on trees, plants, houses and localities, are less stable. They appear to follow a rule that anything that is uncanny or provokes dread for any reason becomes subject to taboo.

The modifications shown by taboo in the richer culture of Polynesia and the Malay Archipelago are, as Wundt himself is obliged to admit, not very profound. The more marked social differences among these peoples find expression in the fact that chiefs, kings and priests exercise a specially effective taboo and are themselves subject to a taboo of the greatest force.

¹ Cf. the first and fourth essays in this work.

But, adds Wundt, the true sources of taboo lie deeper than in the interests of the privileged classes: 'they have their origin in the source of the most primitive and at the same time most lasting of human instincts - in fear of "demonic" powers.' (Ibid., 307.) 'Taboo is originally nothing other than the objectified fear of the "demonic" power which is believed to lie hidden in a tabooed object. The taboo prohibits anything that may provoke that power and commands that, if it has been injured, whether wittingly or unwittingly, the demon's vengeance must be averted.'

Little by little, we are told, taboo then grows into a force with a basis of its own, independent of the belief in demons. It develops into the rule of custom and tradition and finally of law. 'But the unspoken command underlying all the prohibitions of taboo, with their numberless variations according to the time and place, is originally one and one only: "Beware of the wrath of demons!"'

Wundt informs us, then, that taboo is an expression and derivative of the belief of primitive peoples in 'demonic' power. Later, he tells us, it freed itself from this root and remained a power simply because it was a power - from a kind of mental conservatism. And thereafter it itself became the root of our moral precepts and of our laws. Though the first of these assertions may provoke little contradiction, I believe I shall be expressing the thoughts of many readers when I say that Wundt's explanation comes as something of a disappointment. This is surely not tracing back the concept of taboo to its sources or revealing its earliest roots. Neither fear nor demons can be regarded by psychology as 'earliest' things, impervious to any attempt at discovering their antecedents. It would be another matter if demons really existed. But we know that, like gods, they are creations of the human mind: they were made by something and out of something.

Wundt has important views on the double significance of taboo, though these are not very clearly expressed. According to him, the distinction between 'sacred' and 'unclean' did not exist in the primitive beginnings of taboo. For that very reason those concepts were at that stage without the peculiar significance which they could only acquire when they became opposed to each other. Animals, human beings or localities on which a taboo was imposed were 'demonic', not 'sacred', nor, therefore, in the sense which was later acquired, 'unclean'. It is precisely this neutral and intermediate meaning - 'demonic' or 'what may not be touched' - that is appropriately expressed by the word 'taboo', since it stresses a characteristic which remains common for all time both to what is sacred and to what is unclean: the dread of contact with it. The persistence, however, of this important common characteristic is at the same time evidence that the ground covered by the two was originally one and that it was only as a result of further influences that it became differentiated and eventually developed into opposites.

According to Wundt, this original characteristic of taboo - the belief in a 'demonic' power which lies hidden in an object and which, if the object is touched or used unlawfully, takes its vengeance by casting a spell over the wrong-doer - is still wholly and solely 'objectified fear'. That fear has not yet split up into the two forms into which it later develops: veneration and horror.

But how did this split take place? Through the transplanting, so Wundt tells us, of the taboo ordinances from the sphere of demons into the sphere of belief in gods. The contrast between 'sacred' and 'unclean' coincides with a succession of two stages of mythology. The earlier of these stages did not completely disappear when the second one was reached but persisted in what was regarded as an inferior and eventually a contemptible form. It is, he says, a general law of mythology that a stage which has been passed, for the very reason that it has been overcome and driven under by a superior stage, persists in an inferior form alongside the later one, so that the objects of its veneration turn into objects of horror.

The remainder of Wundt's discussion deals with the relation of the concept of taboo to purification and sacrifice.

(2)

Anyone approaching the problem of taboo from the angle of psycho-analysis, that is to say, of the investigation of the unconscious portion of the individual mind, will recognize, after a moment's reflection, that these phenomena are far from unfamiliar to him. He has come across people who have created for themselves individual taboo prohibitions of this very kind and who obey them just as strictly as savages obey the communal taboos of their tribe or society. If he were not already accustomed to describing such people as 'obsessional' patients, he would find 'taboo sickness' a most appropriate name for their condition. Having learnt so much, however, about this obsessional sickness from psycho-analytic examination - its clinical aetiology and the essence of its psychical mechanism - he can scarcely refrain from applying the knowledge he has thus acquired to the parallel sociological phenomenon.

A warning must be uttered at this point. The similarity between taboo and obsessional sickness may be no more than a matter of externals; it may apply only to the *forms* in which they are manifested and not extend to their essential character. Nature delights in making use of the same forms in the most various biological connections: as it does, for instance, in the appearance of branch-like structures both in coral and in plants, and indeed in some forms of crystal and in certain chemical precipitates. It would obviously be hasty and unprofitable to infer the existence of any internal relationship from such points of agreement as these, which merely derive from the operation of the same mechanical causes. We shall bear this warning in mind, but we need not be deterred by it from proceeding with our comparison.

The most obvious and striking point of agreement between the obsessional prohibitions of neurotics and taboos is that these prohibitions are equally lacking in motive and equally puzzling in their origin. Having made their appearance at some unspecified moment, they are forcibly maintained by an irresistible fear. No external threat of punishment is required, for there is an internal certainty, a moral conviction, that any violation will lead to intolerable disaster. The most that an obsessional patient can say on this point is that he has an undefined feeling that some particular person in his environment will be injured as result of the violation. Nothing is known of the nature of the injury; and indeed even this wretchedly small amount of information is more often obtained in connection with the expiatory and defensive actions which we shall have to discuss later than with the prohibitions themselves.

As in the case of taboo, the principal prohibition, the nucleus of the neurosis, is against touching; and thence it is sometimes known as 'touching phobia' or '*délire du toucher*'. The prohibition does not merely apply to immediate physical contact but has an extent as wide as the metaphorical use of the phrase 'to come in contact with'. Anything that directs the patient's thoughts to the forbidden object, anything that brings him into intellectual contact with it, is just as much prohibited as direct physical contact. This same extension also occurs in the case of taboo.

The purpose of some of the prohibitions is immediately obvious. Others, on the contrary, strike us as incomprehensible, senseless and silly, and prohibitions of this latter sort are described as 'ceremonial'. This distinction, too, is found in the observances of taboo.

Obsessional prohibitions are extremely liable to displacement. They extend from one object to another along whatever paths the context may provide, and this new object then becomes, to use the apt expression of one of my women patients, 'impossible' - till at last the whole world lies under an embargo of 'impossibility'. Obsessional patients behave as though the 'impossible' persons and things were carriers of a dangerous infection liable to be spread by contact on to everything in their neighbourhood. I have already drawn attention to the same characteristic capacity for contagion and transference in my description of taboo. We know, too, that anyone who violates a taboo by coming into contact with something that is taboo becomes taboo himself and that then no one may come into contact with *him*.

I will now put side by side two instances of the transference (or, as it is better to say, the *displacement*) of a prohibition. One of these is taken from the life of the Maoris and the other from an observation of my own on a female obsessional patient.

'A Maori chief would not blow a fire with his mouth; for his sacred breath would communicate its sanctity to the fire, which would pass it on to the pot on the fire, which would pass it on to the meat in the pot, which would pass it on to the man who ate the meat, which was in the pot, which stood on the fire, which was breathed on by the chief; so that the eater, infected by the chief's breath conveyed through these intermediaries, would surely die.'¹

My patient's husband purchased a household article of some kind and brought it home with him. She insisted that it should be removed or it would make the room she lived in 'impossible'. For she had heard that the article had been bought in a shop situated in, let us say, 'Smith' Street.² 'Smith', however, was the married name of a woman friend of hers who lived in a distant town and whom she had known in her youth under her maiden name. This friend of hers was at the moment 'impossible' or taboo. Consequently the article that had been purchased here in Vienna was as taboo as the friend herself with whom she must not come into contact.

Obsessional prohibitions involve just as extensive renunciations and restrictions in the lives of those who are subject to them as do taboo prohibitions; but some of them can be lifted if certain actions are performed. Thereafter, these actions *must* be performed: they become compulsive or obsessive acts, and there can be no doubt that they are in the nature of expiation, penance, defensive measures and purification. The commonest of these obsessive acts is washing in water ('washing mania'). Some taboo prohibitions can be replaced in just the same way; or rather their violation can be made good by a similar 'ceremonial'; and here again lustration with water is the preferred method.

Let us now summarize the points in which agreement between taboo usages and obsessional symptoms is most clearly shown: (1) the fact that the prohibitions lack any assignable motive; (2) the fact that they are maintained by an internal necessity; (3) the fact that they are easily displaceable and that there is a risk of infection from the prohibited object; and (4) the fact that they give rise to injunctions for the performance of ceremonial acts.

¹ Frazer (1911*b*, 136).

² ['*Hirschengasse*' and '*Hirsch*' in the original.]

Now both the clinical history and the psychical mechanism of obsessional neurosis have become known to us through psycho-analysis. The clinical history of a typical case of 'touching phobia' is as follows. Right at the beginning, in very early childhood, the patient shows a strong *desire* to touch, the aim of which is of a far more specialized kind that one would have been inclined to expect. This desire is promptly met by an *external* prohibition against carrying out that particular kind of touching.¹ The prohibition is accepted, since it finds support from powerful *internal* forces,² and proves stronger than the instinct which is seeking to express itself in the touching. In consequence, however, of the child's primitive psychical constitution, the prohibition does not succeed in *abolishing* the instinct. Its only result is to *repress* the instinct (the desire to touch) and banish it into the unconscious. Both the prohibition and the instinct persist: the instinct because it has only been repressed and not abolished, and the prohibition because, if it ceased, the instinct would force its way through into consciousness and into actual operation. A situation is created which remains undealt with - a psychical fixation - and everything else follows from the continuing conflict between the prohibition and the instinct.

The principal characteristic of the psychological constellation which becomes fixed in this way is what might be described as the subject's *ambivalent*³ attitude towards a single object, or rather towards one act in connection with that object. He is constantly wishing to perform this act (the touching), and detests it as well. The conflict between these two currents cannot be promptly settled because - there is no other way of putting it - they are localized in the subject's mind in such a manner that they cannot come up against each other. The prohibition is noisily conscious, while the persistent desire to touch is unconscious and the subject knows nothing of it. If it were not for this psychological factor, an ambivalence like this could neither last so long nor lead to such consequences.

¹ Both the desire and the prohibition relate to the child's touching his own genitals.

² That is, from the child's loving relation to the authors of the prohibition.

³ To borrow the apt term coined by Bleuler.

In our clinical history of a case we have insisted that the imposition of the prohibition in very early childhood is the determining point; a similar importance attaches in the subsequent developments to the mechanism of repression at the same early age. As a result of the repression which has been enforced and which involves a loss of memory - an amnesia - the motives for the prohibition (which is conscious) remain unknown; and all attempts at disposing of it by intellectual processes must fail, since they cannot find any base of attack. The prohibition owes its strength and its obsessive character precisely to its unconscious opponent, the concealed and undiminished desire - that is to say, to an internal necessity inaccessible to conscious inspection. The ease with which the prohibition can be transferred and extended reflects a process which falls in with the unconscious desire and is greatly facilitated by the psychological conditions that prevail in the unconscious. The instinctual desire is constantly shifting in order to escape from the *impasse* and endeavours to find substitutes - substitute objects and substitute acts - in place of the prohibited ones. In consequence of this, the prohibition itself shifts about as well, and extends to any new aims which the forbidden impulse may adopt. Any fresh advance made by the repressed libido is answered by a fresh sharpening of the prohibition. The mutual inhibition of the two conflicting forces produces a need for discharge, for reducing the prevailing tension; and to this may be attributed the reason for the performance of obsessive acts. In the case of a neurosis these are clearly compromise actions: from one point of view they are evidences of remorse, efforts at expiation, and so on, while on the other hand they are at the same time substitutive acts to compensate the instinct for what has been prohibited. It is a law of neurotic illness that these obsessive acts fall more and more under the sway of the instinct and approach nearer and nearer to the activity which was originally prohibited.

Let us now make the experiment of treating taboo as though it were of the same nature as an obsessional prohibition in one of our patients. We must make it clear beforehand, however, that many of the taboo prohibitions that come under our notice are of a secondary, displaced and distorted kind, and that we shall have to be satisfied if we can throw only a little light on the most fundamental and significant taboos. Moreover, the differences between the situation of a savage and of a neurotic are no doubt of sufficient importance to make any exact agreement impossible and to prevent our carrying the comparison to the point of identity in every detail.

In the first place, then, it must be said that there is no sense in asking savages to tell us the real reason for their prohibitions - the origin of taboo. It follows from our postulates that they cannot answer, since their real reason must be 'unconscious'. We can, however, reconstruct the history of taboo as follows on the model of obsessional prohibitions. Taboos, we must suppose, are prohibitions of *primaeval* antiquity which were at some time externally imposed upon a generation of primitive men; they must, that is to say, no doubt have been impressed on them violently by the previous generation. These prohibitions must have concerned activities towards which there was a strong inclination. They must then have persisted from generation to generation, perhaps merely as a result of tradition transmitted through parental and social authority. Possibly, however, in later generations they may have become 'organized' as an inherited psychical endowment. Who can decide whether such things as 'innate ideas' exist, or whether in the present instance they have operated, either alone or in conjunction with education, to bring about the permanent fixing of taboos? But one thing would certainly follow from the persistence of the taboo, namely that the original desire to do the prohibited thing must also still persist among the tribes concerned. They must therefore have an ambivalent attitude towards their taboos. In their unconscious there is nothing they would like more than to violate them, but they are afraid to do so; they are afraid precisely because they would like to, and the fear is stronger than the desire. The desire is unconscious, however, in every individual member of the tribe just as it is in neurotics.

The most ancient and important taboo prohibitions are the two basic laws of totemism: not to kill the totem animal and to avoid sexual intercourse with members of the totem clan of the opposite sex.

These, then, must be the oldest and most powerful of human desires. We cannot hope to understand this or test our hypothesis on these two examples, so long as we are totally ignorant of the meaning and origin of the totemic system. But the wording of these two taboos and the fact of their concurrence will remind anyone acquainted with the findings of psycho-analytic investigations on individuals of something quite definite, which psycho-analysts regard as the centre-point of childhood wishes and as the nucleus of neuroses.¹

The multiplicity of the manifestations of taboo, which have led to the attempts at classification that I have already mentioned, are reduced to a single unity by our thesis: the basis of taboo is a prohibited action, for performing which a strong inclination exists in the unconscious.

We have heard, though without understanding it, that anyone who does what is forbidden, that is, who violates a taboo, becomes taboo himself. How is this to be brought into line with the fact that taboo attaches not only to a person who has done what is forbidden but also to persons in particular states, to the states themselves, as well as to impersonal objects? What can the dangerous attribute be which remains the same under all these different conditions? There is only one thing it can be: the quality of exciting men's ambivalence and *tempting* them to transgress the prohibition.

Anyone who has violated a taboo becomes taboo himself because he possesses the dangerous quality of tempting others to follow his example: why should *he* be allowed to do what is forbidden to others? Thus he is truly contagious in that every example encourages imitation, and for that reason he himself must be shunned.

But a person who has not violated any taboo may yet be permanently or temporarily taboo because he is in a state which possesses the quality of arousing forbidden desires in others and of awakening a conflict of ambivalence in them. The majority of exceptional positions and exceptional states are of this kind and possess this dangerous power. The king or chief arouses envy on account of his privileges: everyone, perhaps, would like to be a king. Dead men, new-born babies and women menstruating or in labour stimulate desires by their special helplessness; a man who has just reached maturity stimulates them by the promise of new enjoyment. For that reason all of these persons and all of these states are taboo, since temptation must be resisted.

¹ Cf. my forthcoming study upon totemism, to which I have referred more than once in these pages (the fourth essay in this work).

Now, too, we can understand why the amounts of *mana* possessed by different persons can be subtracted from one another and can to some extent cancel one another out. A king's taboo is too strong for one of his subjects because the social difference between them is too great. But a minister may without any harm serve as an intermediary between them. If we translate this from the language of taboo into that of normal psychology, it means something like this. A subject, who dreads the great temptation presented to him by contact with the king, can perhaps tolerate dealings with an official whom he does not need to envy so much and whose position may even seem attainable to him. A minister, again, can mitigate his envy of the king by reflecting on the power which he himself wields. So it comes about that smaller differences between the amounts of the tempting magical force possessed by two people are less to be feared than greater ones.

It is equally clear why it is that the violation of certain taboo prohibitions constitutes a social danger which must be punished or atoned for by *all* the members of the community if they are not all to suffer injury. If we replace the unconscious desires by conscious impulses we shall see that the danger is a real one. It lies in the risk of imitation, which would quickly lead to the dissolution of the community. If the violation were not avenged by the other members they would become aware that they wanted to act in the same way as the transgressor. We cannot be surprised at the fact that, in the restrictions of taboo, touching plays a part similar to the one which it plays in 'touching phobias', though the secret meaning of the prohibition cannot be of such a specialized nature in taboo as it is in the neurosis. Touching is the first step towards obtaining any sort of control over, or attempting to make use of, a person or object.

We have translated the contagious power inherent in taboo into the possession of some attribute likely to produce temptation or encourage imitation. This does not appear to tally with the fact that the contagious character of taboo is shown chiefly by its transmissibility on to material objects, which then themselves become carriers of taboo.

This transmissibility of taboo is a reflection of the tendency, on which we have already remarked, for the unconscious instinct in the neurosis to shift constantly along associative paths on to new objects. Our attention is thus directed to the fact that the dangerous magical force of *mana* corresponds to two powers of a more realistic sort: the power of reminding a man of his own prohibited wishes and the apparently more important one of inducing him to transgress the prohibition in obedience to those wishes. These two functions can be reduced to one, however, if we suppose that in a primitive mind the awakening of the memory of a forbidden action is naturally linked with the awakening of an impulse to put that action into effect. Thus recollection and temptation come together again. It must be admitted, too, that, in so far as the example of a man transgressing a prohibition tempts another man to do the same, disobedience to prohibitions spreads like a contagion, in just the same way as a taboo is transferred from a person to a material object and from one material object to another.

If the violation of a taboo can be made good by atonement or expiation, which involve the renunciation of some possession or some freedom, this proves that obedience to the taboo injunction meant in itself the renunciation of something desirable. Emancipation from one renunciation is made up for by the imposition of another one elsewhere. This leads us to conclude that atonement is a more fundamental factor than purification in the ceremonials of taboo.

I will now sum up the respects in which light has been thrown on the nature of taboo by comparing it with the obsessional prohibitions of neurotics. Taboo is a *primaevae* prohibition forcibly imposed (by some authority) from outside, and directed against the most powerful longings to which human beings are subject. The desire to violate it persists in their unconscious; those who obey the taboo have an ambivalent attitude to what the taboo prohibits. The magical power that is attributed to taboo is based on the capacity for arousing temptation; and it acts like a contagion because examples are contagious and because the prohibited desire in the unconscious shifts from one thing to another. The fact that the violation of a taboo can be atoned for by a renunciation shows that renunciation lies at the basis of obedience to taboo.

(3)

What we now want to discover is how much value is to be attributed to the parallel we have drawn between taboo and obsessional neurosis and to the view of taboo which we have based on that parallel. Their value must clearly depend on whether the view we have put forward has any advantages over others, and whether it gives us a clearer understanding of taboo than we could otherwise reach. We may be inclined to feel that we have given sufficient evidence of the applicability of our view in what has already been said; yet we must attempt to strengthen the evidence by entering into our explanation of taboo prohibitions and usages in greater detail.

There is also another path open to us. We can start an inquiry as to whether some of the hypotheses which we have carried over from neuroses to taboo or some of the results to which that procedure has led us may not be directly verifiable in the phenomena of taboo. But we must decide what we are to look for. Our assertion that taboo originated in a *primaeval* prohibition imposed at one time or other by some external authority is obviously incapable of demonstration. What we shall rather endeavour to confirm, therefore, are the psychological determinants of taboo, which we have learnt to know from obsessional neurosis. How did we arrive at our knowledge of these psychological factors in the case of the neurosis? Through the analytical study of its symptoms, and particularly of obsessional acts, defensive measures and obsessional commands. We found that they showed every sign of being derived from *ambivalent* impulses, either corresponding simultaneously to *both* a wish and a counter-wish or operating predominantly on behalf of *one* of the two opposing trends. If, now, we could succeed in demonstrating that ambivalence, that is, the dominance of opposing trends, is also to be found in the observances of taboo, or if we could point to some of them which, like obsessional acts, give simultaneous expression to both currents, we should have established the psychological agreement between taboo and obsessional neurosis in what is perhaps their most important feature.

The two fundamental prohibitions of taboo are, as I have already remarked, inaccessible to our analysis owing to their connection with totemism; while certain others of its injunctions are of a secondary nature and consequently useless for our purpose. For taboo has become the ordinary method of legislation in the communities affected by it and it has come to serve social purposes which are certainly more recent than taboo itself: such, for instance, are the taboos imposed by chiefs and priests for the protection of their own property and privileges. There nevertheless remain a large group of observances on which our investigation can be made. From these I shall select the taboos attaching (a) to enemies, (b) to chiefs and (c) to the dead; and I shall take the material for our examination from the excellent collection included by Frazer in *Taboo and the Perils of the Soul* (1911*b*), the second part of his great work *The Golden Bough*.

(a) *The Treatment of Enemies*

We may be inclined to suppose that savage and half-savage races are guilty of uninhibited and ruthless cruelty towards their enemies. We shall be greatly interested to learn, then, that even in their case the killing of a man is governed by a number of observances which are included among the usages of taboo. These observances fall easily into four groups. They demand (1) the appeasement of the slain enemy, (2) restrictions upon the slayer, (3) acts of expiation and purification by him and (4) certain ceremonial observances. Our incomplete information on the subject does not enable us to determine with certainty how general or the reverse these usages may be among the peoples concerned; but for our purposes this is a matter of indifference. It may safely be assumed, in any case, that what we have before us are not isolated peculiarities but widespread usages.

The rites of *appeasement* performed in the island of Timor, when a warlike expedition has returned in triumph bringing the heads of the vanquished foe, are particularly remarkable, since in addition to them the leader of the expedition is submitted to severe restrictions (see below, p. 2687). On the occasion of the expedition's return, sacrifices are offered to appease the souls of the men whose heads have been taken. 'The people think that some misfortune would befall the victor were such offerings omitted. Moreover, a part of the ceremony consists of a dance accompanied by a song, in which the death of the slain man is lamented and his forgiveness is entreated. "Be not angry", they say, "because your head is here with us; had we been less lucky, our heads might now have been exposed in your village. We have offered the sacrifice to appease you. Your spirit may now rest and leave us in peace. Why were you our enemy? Would it not have been better that we should remain friends? Then your blood would not have been spilt and your head would not have been cut off."' ¹ The same is true of the people of Paloo, in Celebes. So, too, 'the Gallas returning from war sacrifice to the jinn or guardian spirits of their slain foes before they will re-enter their own houses'. ²

Other peoples have found a means for changing their former enemies after their death into guardians, friends and benefactors. This method lies in treating their severed heads with affection, as some of the savage races of Borneo boast of doing. When the Sea Dyaks of Sarawak bring home a head from a successful head-hunting expedition, for months after its arrival it is treated with the greatest consideration and addressed with all the names of endearment of which their language is capable. The most dainty morsels of food are thrust into its mouth, delicacies of all kinds and even cigars. The head is repeatedly implored to hate its former friends and to love its new hosts since it has now become one of them. It would be a great mistake to suppose that these observances, which strike us as so horrible, are performed with any intention of ridicule. ³

In several of the savage tribes of North America observers have been struck by the mourning over enemies who have been killed and scalped. When a Choctaw had killed an enemy, he went into mourning for a month during which he was subjected to severe restrictions; and the Dacotas had similar practices. When the Osages, reports a witness, have mourned over their own dead, 'they will mourn for the foe just as if he was a friend'. ⁴

¹ Frazer (1911*b*, 166).

² Frazer (loc. cit.), quoting Paulitschke (1893-6).

³ Frazer (1914, 1, 295), quoting Low (1848).

⁴ Frazer (1911*b*, 181), quoting Dorsey (1884).

Before considering the remaining classes of taboo usages in connection with enemies, we must deal with an obvious objection. It will be argued against us, with Frazer and others, that the grounds for such rites of appeasement are simple enough and have nothing to do with any such thing as 'ambivalence'. These peoples are dominated by a superstitious fear of the ghosts of the slain - a fear which was not unknown in classical antiquity and which was put upon the stage by the great English dramatist in the hallucinations of Macbeth and Richard III. All the rites of appeasement follow logically from this superstition, as well as the restrictions and acts of expiation which will be discussed presently. This view is also supported by the fourth group of these observances, which can only be explained as attempts at driving away the ghosts of the victims that are pursuing their murderers.¹ In addition to this, the savages openly admit their fear of the ghosts of dead enemies and themselves attribute to it the taboo usages which we are discussing.

This objection is indeed an obvious one, and if it covered the whole ground we could save ourselves the trouble of any further attempt at an explanation. I shall put off dealing with it until later, and for the moment I will merely state the alternative view which is derived from the hypothesis based upon our earlier discussions of taboo. The conclusion that we must draw from all these observances is that the impulses which they express towards an enemy are not solely hostile ones. They are also manifestations of remorse, of admiration for the enemy, and of a bad conscience for having killed him. It is difficult to resist the notion that, long before a table of laws was handed down by any god, these savages were in possession of a living commandment: 'Thou shalt not kill', a violation of which would not go unpunished.

Let us now return to the other three groups of taboo observances. *Restrictions* placed upon a victorious slayer are unusually frequent and as a rule severe. In Timor (cf. the rites of appeasement described above, on p. 2685) the leader of the expedition is forbidden 'to return at once to his own house. A special hut is prepared for him, in which he has to reside for two months, undergoing bodily and spiritual purification. During this time he may not go to his wife nor feed himself; the food must be put into his mouth by another person.'² In some Dyak tribes men returning from a successful expedition are obliged to keep to themselves for several days and abstain from various kinds of food; they may not touch iron nor have any intercourse with women. In Logea, an island in the neighbourhood of New Guinea, 'men who have killed or assisted in killing enemies shut themselves up for about a week in their houses. They must avoid all intercourse with their wives and friends, and they may not touch food with their hands. They may eat vegetable food only, which is brought to them cooked in special pots. The intention of these restrictions is to guard the men against the smell of the blood of the slain; for it is believed that if they smelt the blood they would fall ill and die. In the Toaripi or Motumotu tribe of south-eastern New Guinea a man who has killed another may not go near his wife, and may not touch food with his fingers. He is fed by others, and only with certain kinds of food. These observances last till the new moon.' (Frazer, 1911*b*, 167.)

¹ Frazer (1911*b*, 169-74). These ceremonies consist of beating on shields, shouting and screaming, making noises with musical instruments, etc.

² Frazer (1911*b*, 166), quoting Müller (1857).

I shall not attempt to give a complete catalogue of the instances quoted by Frazer of restrictions imposed upon victorious manslayers. I will only remark upon a few more such cases in which their taboo character is particularly marked or in which the restrictions are accompanied by expiation, purification and other ceremonials.

‘Among the Monumbos of German New Guinea anyone who has slain a foe in war becomes thereby “unclean” - the same term being applied to women who are menstruating or in child-bed. He ‘must remain a long time in the men’s club-house, while the villagers gather round him and celebrate his victory with dance and song. He may touch nobody, not even his own wife and children; if he were to touch them it is believed that they would be covered with sores. He becomes clean again by washing and using other modes of purification.’

‘Among the Natchez of North America young braves who had taken their first scalps were obliged to observe certain rules of abstinence for six months. They might not sleep with their wives nor eat flesh; their only food was fish and hasty-pudding. . . . When a Choctaw had killed an enemy and taken his scalp, he went into mourning for a month, during which he might not comb his hair, and if his head itched he might not scratch it except with a little stick which he wore fastened to his wrist for the purpose.’

‘When a Pima Indian had killed an Apache, he had to go through severe ceremonies of purification and atonement. During a sixteen-day fast he might not touch meat nor salt, nor look on a blazing fire, nor speak to a human being. He lived alone in the woods, waited on by an old woman, who brought him his scanty dole of food. He bathed often in the river and (as a sign of mourning) kept his head covered with a plaster of mud. On the seventeenth day there was a public ceremony of solemn purification of the man and his weapons. Since the Pima Indians took the taboo on killing much more seriously than their enemies and did not, like them, postpone the expiation and purification till the end of the expedition, their warlike efficiency suffered greatly from their moral strictness, or piety, if that term is preferred. Despite their extreme courage, the Americans found them unsatisfactory allies in their operations against the Apaches.’

However much the details and variations of the ceremonies of expiation and purification after the slaying of enemies might be of interest for deeper research into the subject, I shall break off at this point, since for our present purpose they have nothing more to tell us. I may perhaps suggest that the temporary or permanent isolation of professional executioners, which has persisted to the present day, may belong in this connection. The position of the public hangman in mediaeval society offers a good picture of the workings of taboo among savages.¹

¹ Further examples of these practices will be found in Frazer (1911*b*, 165-90) in the section upon ‘Manslayers tabooed’.

In the accepted explanation of all these observances of appeasement, restriction, expiation and purification, two principles are combined: the extension of the taboo from the slain man on to everything that has come in contact with him, and the fear of the slain man's ghost. How these two factors are to be combined with each other to explain the ceremonials, whether they are to be regarded as of equal weight, whether one is primary and the other secondary, and if so which - none of these questions receives an answer, and indeed it would be hard to find one. We, on the other hand, can lay stress on the *unity* of our view, which derives all of these observances from emotional ambivalence towards the enemy.

(b) The Taboo upon Rulers

The attitude of primitive peoples to their chiefs, kings and priests is governed by two basic principles which seem to be complementary rather than contradictory. A ruler 'must not only be guarded, he must also be guarded against'. (Frazer, 1911*b*, 132.) Both of these ends are secured by innumerable taboo observances. We know already why it is that rulers must be guarded against. It is because they are vehicles of the mysterious and dangerous magical power which is transmitted by contact like an electric charge and which brings death and ruin to anyone who is not protected by a similar charge. Any immediate or indirect contact with this dangerous sacred entity is therefore avoided; and, if it cannot be avoided, some ceremonial is devised to avert the dreaded consequences. The Nubas of East Africa, for instance, 'believe that they would die if they entered the house of their priestly king; however they can evade the penalty of their intrusion by baring the left shoulder and getting the king to lay his hand on it'. Here we are met by the remarkable fact that contact with the king is a remedy and protection against the dangers provoked by contact with the king. No doubt, however, there is a contrast to be drawn between the remedial power of a touch made deliberately by the king and the danger which arises if he is touched - a contrast between a passive and an active relation to the king.

For examples of the healing power of the royal touch there is no need to resort to savages. The kings of England, in times that are not yet remote, enjoyed the power of curing scrofula, which was known accordingly as 'the King's Evil'. Queen Elizabeth I exercised this royal prerogative no less than her successors. Charles I is said to have cured a hundred patients at a stroke in 1633. But it was after the Restoration of the monarchy under his dissolute son, Charles II, that the royal cures of scrofula reached their climax. In the course of his reign he is reputed to have touched close upon a hundred thousand persons. The crowd of those in search of cure used to be so great that on one occasion six or seven of those who came to be healed were trampled to death. The sceptical William of Orange, who became King of England after the dismissal of the Stuarts, refused to lend himself to these magical practices. On the only occasion on which he was persuaded into laying his hands on a patient, he said to him: 'God give you better health and more sense.' (Frazer, 1911a, 1, 368-70.)

The stories which follow are evidence of the fearful effects of active contact made, even unintentionally, with a king or anything belonging to him. 'It once happened that a New Zealand chief of high rank and great sanctity had left the remains of his dinner by the wayside. A slave, a stout, hungry fellow, coming up after the chief had gone, saw the unfinished dinner, and ate it up without asking questions. Hardly had he finished when he was informed by a horror-stricken spectator that the food of which he had eaten was the chief's.' He was a strong, courageous man, but 'no sooner did he hear the fatal news than he was seized with the most extraordinary convulsions and cramp in the stomach, which never ceased till he died, about sundown the same day'.¹ 'A Maori woman having eaten of some fruit, and being afterwards told that the fruit had been taken from a tabooed place, exclaimed that the spirit of the chief, whose sanctity had been thus profaned, would kill her. This was in the afternoon, and next day by twelve o'clock she was dead.'² 'A Maori chief's tinder-box was once the means of killing several persons; for, having been lost by him, and found by some men who used it to light their pipes, they died of fright on learning to whom it had belonged.'³

¹ Frazer (1911b, 134-5), quoting a Pakeha Maori (1884).

² Frazer (loc. cit.), quoting Brown (1845).

³ Frazer (loc. cit.).

It is not to be wondered at that a need was felt for isolating such dangerous persons as chiefs and priests from the rest of the community - to build a barrier round them which would make them inaccessible. It may begin to dawn on us that this barrier, originally erected for the observance of taboo, exists to this day in the form of court ceremonial.

But perhaps the major part of this taboo upon rulers is not derived from the need for protection *against* them. The second reason for the special treatment of privileged persons - the need to provide protection *for* them against the threat of danger - has had an obvious part in creating taboos and so of giving rise to court etiquette.

The need to protect the king from every possible form of danger follows from his immense importance to his subjects, whether for weal or woe. It is his person which, strictly speaking, regulates the whole course of existence. 'The people have to thank him for the rain and sunshine which foster the fruits of the earth, for the wind which brings ships to their coasts, and even for the solid ground beneath their feet.' (Frazer, 1911*b*, 7.)

These rulers among savage peoples possess a degree of power and a capacity to confer benefits which are an attribute only of gods, and with which at later stages of civilization only the most servile of courtiers would pretend to credit them.

It must strike us as self-contradictory that persons of such unlimited power should need to be protected so carefully from the threat of danger; but that is not the only contradiction shown in the treatment of royal personages among savage peoples. For these peoples also think it necessary to keep a watch on their king to see that he makes a proper use of his powers; they feel by no means convinced of his good intentions or conscientiousness. Thus an element of distrust may be traced among the reasons for the taboo observances that surround the king. 'The idea', writes Frazer (1911*b*, 7 f.), 'that early kingdoms are despotisms in which the people exist only for the sovereign, is wholly inapplicable to the monarchies we are considering. On the contrary, the sovereign in them exists only for his subjects; his life is only valuable so long as he discharges the duties of his position by ordering the course of nature for his people's benefit. So soon as he fails to do so, the care, the devotion, the religious homage which they had hitherto lavished on him cease and are changed into hatred and contempt; he is dismissed ignominiously, and may be thankful if he escapes with his life. Worshipped as a god one day, he is killed as a criminal the next. But in this changed behaviour of the people there is nothing capricious or inconstant. On the contrary, their conduct is entirely of a piece. If their king is their god, he is or should be also their preserver; and if he will not preserve them, he must make room for another who will. So long, however, as he answers their expectations, there is no limit to the care which they take of him, and which they compel him to take of himself. A king of this sort lives hedged in by a ceremonious etiquette, a network of prohibitions and observances, of which the intention is not to contribute to his dignity, much less to his comfort, but to restrain him from conduct which, by disturbing the harmony of nature, might involve himself, his people, and the universe in one common catastrophe. Far from adding to his comfort, these observances, by trammelling his every act, annihilate his freedom and often render the very life, which it is their object to preserve, a burden and sorrow to him.'

One of the most glaring instances of a sacred ruler being fettered and paralysed in this way by taboo ceremonials is to be found in the mode of life of the Mikado of Japan in earlier centuries. An account written more than two hundred years ago reports that the Mikado 'thinks it would be very prejudicial to his dignity and holiness to touch the ground with his feet; for this reason, when he intends to go anywhere, he must be carried thither on men's shoulders. Much less will they suffer that he should expose his sacred person to the open air, and the sun is not thought worthy to shine on his head. There is such a holiness ascribed to all parts of his body that he dares to cut off neither his hair, nor his beard, nor his nails. However, lest he should grow too dirty, they may clean him in the night when he is asleep; because, they say, that which is taken from his body at that time hath been stolen from him and that such a theft doth not prejudice his holiness or dignity. In ancient times he was obliged to sit on the throne for some hours every morning, with the imperial crown on his head, but to sit altogether like a statue, without stirring either hands or feet, head or eyes, nor indeed any part of his body, because, by this means, it was thought that he could preserve peace and tranquillity in his empire; for if, unfortunately, he turned himself on one side or the other, or if he looked a good while towards any part of his dominions, it was apprehended that war, famine, fire, or some other great misfortune was near at hand to desolate the country.'¹

Some of the taboos laid upon barbarian kings remind one vividly of the restrictions imposed upon murderers. Thus in West Africa, 'at Shark Point near Cape Padron, in Lower Guinea, lives the priestly king Kukulu, alone in a wood. He may not touch a woman nor leave his house; indeed he may not even quit his chair, in which he is obliged to sleep sitting, for if he lay down no wind would arise and navigation would be stopped. He regulates storms, and in general maintains a wholesome and equable state of the atmosphere.' The same writer says of Loango (in the same part of the world) that the more powerful a king is, the more taboos he is bound to observe.² The heir to the throne is also subject to them from infancy; their number increases as he advances in life, till at the moment that he ascends the throne he is positively suffocated by them.

Our space will not allow nor does our interest require us to enter further into a description of the taboos associated with the dignity of kings and priests. I will only add that the principal part is played in them by restrictions upon freedom of movement and upon diet. Two examples of taboo ceremonials occurring in civilized communities of a far higher level of culture will serve to show, however, what a conservative effect upon ancient usages is exercised by contact with these privileged personages.

¹ Kaempfer (1727), quoted by Frazer (1911*b*, 3 f.).

² Frazer (1911*b*, 5 and 8), quoting Bastian (1874-5).

The Flamen Dialis, the high priest of Jupiter in ancient Rome, was obliged to observe an extraordinary number of taboos. He 'might not ride or even touch a horse, nor see an army under arms, nor wear a ring which was not broken, nor have a knot on any part of his garments; . . . he might not touch wheaten flour or leavened bread; he might not touch or even name a goat, a dog, raw meat, beans, and ivy; . . . his hair could be cut only by a free man and with a bronze knife, and his hair and nails when cut had to be buried under a lucky tree; . . . he might not touch a dead body; . . . he might not be uncovered in the open air', and so on. 'His wife, the Flaminica, had to observe nearly the same rules, and others of her own besides. She might not ascend more than three steps of the kind of staircase called Greek; at a certain festival she might not comb her hair; the leather of her shoes might not be made from a beast that had died a natural death, but only from one that had been slain or sacrificed; if she heard thunder she was tabooed till she had offered an expiatory sacrifice.' (Frazer, 1911*b*, 13 f.)

The ancient kings of Ireland were subject to a number of exceedingly strange restrictions. If these were obeyed, every kind of blessing would descend upon the country, but if they were violated, disasters of every kind would visit it. A complete list of these taboos is contained in the *Book of Rights*, the two oldest manuscript copies of which date from 1390 and 1418. The prohibitions are of the most detailed character, and refer to specific actions at specific places at specific times: the king, for instance, may not stay in a certain town on a particular day of the week; he may not cross a certain river at a particular hour of the day; he may not encamp for nine days on a certain plain, and so on. (Frazer, 1911*b*, 11 f.)

Among many savage peoples the severity of these taboo restrictions upon priestly kings has led to consequences which have been important historically and are of particular interest from our point of view. The dignity of their position ceased to be an enviable thing, and those who were offered it often took every possible means of escaping it. Thus in Cambodia, where there are kingships of Fire and Water, it is often necessary to force successors into accepting these distinctions. On Niue or Savage Island, a coral island in the South Pacific, the monarchy actually came to an end because no one could be induced to take over the responsible and dangerous office. 'In some parts of West Africa, when the king dies, a family council is secretly held to determine his successor. He on whom the choice falls is suddenly seized, bound, and thrown into the fetish-house, where he is kept in durance till he consents to accept the crown. Sometimes the heir finds means of evading the honour which it is thought to thrust upon him; a ferocious chief has been known to go about constantly armed, resolute to resist by force any attempt to set him on the throne.'¹ Among the natives of Sierra Leone the objection to accepting the honour of kingship become so great that most tribes were obliged to choose foreigners as their kings.

Frazer (1911*b*, 17-25) attributes to these circumstances the fact that in the course of history there eventually came about a division of the original priestly kingship into a spiritual and a temporal power. Weighed down by the burden of their sacred office, kings became unable to exert their dominance in real affairs and these were left in the hands of inferior but practical persons, who were ready to renounce the honours of kingship. These, then, became the temporal rulers, while spiritual supremacy, deprived of any practical significance, was left to the former taboo kings. It is familiar knowledge how far this hypothesis finds confirmation in the history of old Japan.

¹ Frazer (1911*b*, 17 f.), quoting Bastian (1874-5).

If we take a general survey of the relations of primitive men to their rulers, we are left with an expectation that we shall have no great difficulty in advancing from a description of them to a psycho-analytic understanding of them. Those relations are of a complex kind and not free from contradictions. Rulers are allowed great privileges, which coincide exactly with the taboo prohibitions imposed on other people. They are privileged persons: they may do or enjoy precisely what other people are forbidden by taboo. As against this freedom, however, we find that they are restricted by other taboos from which common people are exempt. Here we have a first contrast - a contradiction, almost - the fact, that is, of the same individual being both more free and more restricted. Again, they are regarded as possessing extraordinary powers of magic, so that people are afraid of coming into contact with their persons or their property, while on the other hand the most beneficial consequences are expected from that same contact. Here there seems to be another, particularly glaring, contradiction; but, as we have already seen, it is only an apparent one. Contacts originating from the king himself are healing and protective; the dangerous contacts are those effected by common men upon the king or his belongings - probably because they may hint at aggressive impulses. Yet another contradiction, and one not so easily resolved, is to be found in the fact that the ruler is believed to exercise great authority over the forces of Nature, but that he has to be most carefully protected against the threat of danger - as though his own power, which can do so much, cannot do this. The situation is made still more difficult by the fact that the ruler cannot be trusted to make use of his immense powers in the right way, that is, for the benefit of his subjects and for his own protection. Thus people distrust him and feel justified in keeping a watch on him. The etiquette of taboos to which the king's whole life is subjected serves all these protective purposes at once: his own protection from dangers and the protection of his subjects from the dangers with which he threatens them.

It seems plausible to explain the complicated and contradictory attitude of primitive peoples to their rulers in some such way as the following. For superstitious and other reasons, a variety of different impulses find expression in relation to kings; and each of these impulses is developed to an extreme point without regard to the others. This gives rise to contradictions - by which, incidentally, a savage intellect is as little disturbed as is a highly civilized one when it comes to such matters as religion or 'loyalty'.

So far so good; but the technique of psycho-analysis allows us to go into the question further and to enter more into the details of these various impulses. If we submit the recorded facts to analysis, as though they formed part of the symptoms presented by a neurosis, our starting-point must be the excessive apprehensiveness and solicitude which is put forward as the reason for the taboo ceremonials. The occurrence of excessive solicitude of this kind is very common in neuroses, and especially in obsessional neuroses, with which our comparison is chiefly drawn. We have come to understand its origin quite clearly. It appears wherever, in addition to a predominant feeling of affection, there is also a contrary, but unconscious, current of hostility - a state of affairs which represents a typical instance of an ambivalent emotional attitude. The hostility is then shouted down, as it were, by an excessive intensification of the affection, which is expressed as solicitude and becomes compulsive, because it might otherwise be inadequate to perform its task of keeping the unconscious contrary current of feeling under repression. Every psycho-analyst knows from experience with what certainty this explanation of solicitous over-affection is found to apply even in the most unlikely circumstances - in cases, for instance, of attachments between a mother and child or between a devoted married couple. If we now apply this to the case of privileged persons, we shall realize that alongside the veneration, and indeed idolization, felt towards them, there is in the unconscious an opposing current of intense hostility; that, in fact, as we expected, we are faced by a situation of emotional ambivalence. The distrust which provides one of the unmistakable elements in kingly taboos would thus be another, more direct, expression of the same unconscious hostility. Indeed, owing to the variety of outcomes of a conflict of this kind which are reached among different peoples, we are not at a loss for examples in which the existence of this hostility is still more obviously shown. 'The savage Timmes of Sierra Leone', we learn from Frazer,¹ 'who elect their king, reserve to themselves the right of beating him on the eve of his coronation; and they avail themselves of this constitutional privilege with such hearty goodwill that sometimes the unhappy monarch does not long survive his elevation to the throne. Hence when the leading chiefs have a spite at a man and wish to rid themselves of him, they elect him king.' Even in glaring instances like this, however, the hostility is not admitted as such, but masquerades as a ceremonial.

¹ Frazer (1911*b*, 18), quoting Zweifel and Moustier (1880).

Another side of the attitude of primitive peoples towards their rulers recalls a procedure which is common in neuroses generally but comes into the open in what are known as delusions of persecution. The importance of one particular person is immensely exaggerated and his absolute power is magnified to the most improbable degree, in order that it may be easier to make him responsible for everything disagreeable that the patient may experience. Savages are really behaving in just the same way with their kings when they ascribe to them power over rain and sunshine, wind and weather, and then depose them or kill them because Nature disappoints their hopes of a successful hunt or a rich harvest. The model upon which paranoics base their delusions of persecution is the relation of a child to his father. A son's picture of his father is habitually clothed with excessive powers of this kind, and it is found that distrust of the father is intimately linked with admiration for him. When a paranoic turns the figure of one of his associates into a 'persecutor', he is raising him to the rank of a father: he is putting him into a position in which he can blame him for all his misfortunes. Thus this second analogy between savages and neurotics gives us a glimpse of the truth that much of a savage's attitude to his ruler is derived from a child's infantile attitude to his father.

But the strongest support for our effort to equate taboo prohibitions with neurotic symptoms is to be found in the taboo ceremonials themselves, the effect of which upon the position of royalty has already been discussed. These ceremonials unmistakably reveal their double meaning and their derivation from ambivalent impulses, as soon as we are ready to allow that the results which they bring about were intended from the first. The taboo does not only pick out the king and exalt him above all common mortals, it also makes his existence a torment and an intolerable burden and reduces him to a bondage far worse than that of his subjects. Here, then, we have an exact counterpart of the obsessional act in the neurosis, in which the suppressed impulse and the impulse that suppresses it find simultaneous and common satisfaction. The obsessional act is *ostensibly* a protection against the prohibited act; but *actually*, in our view, it is a repetition of it. The 'ostensibly' applies to the *conscious* part of the mind, and the 'actually' to the *unconscious* part. In exactly the same way, the ceremonial taboo of kings is *ostensibly* the highest honour and protection for them, while *actually* it is a punishment for their exaltation, a revenge taken on them by their subjects. The experiences of Sancho Panza (as described by Cervantes) when he was Governor of his island convinced him that this view of court ceremonial was the only one that met the case. If we could hear the views of modern kings and rulers on the subject, we might find that there were many others who agreed with him.

The question of why the emotional attitude towards rulers includes such a powerful unconscious element of hostility raises a very interesting problem, but one that lies outside the limits of the present study. I have already hinted at the fact that the child's complex of emotions towards his father - the father-complex - has a bearing on the subject, and I may add that more information on the early history of the kingship would throw a decisive light on it. Frazer (1911a) has put forward impressive reasons, though, as he himself admits, not wholly conclusive ones, for supposing that the earliest kings were foreigners who, after a brief reign, were sacrificed with solemn festivities as representatives of the deity. It is possible that the course taken by the evolution of kings may also have had an influence upon the myths of Christendom.

(c) The Taboo upon the Dead

We know that the dead are powerful rulers; but we may perhaps be surprised when we learn that they are treated as enemies.

The taboo upon the dead is - if I may revert to the simile of infection - especially virulent among most primitive peoples. It is manifested, in the first instance, in the consequences that follow contact with the dead and in the treatment of mourners.

Among the Maoris anyone who had handled a corpse or taken any part in its burial was in the highest degree unclean and was almost cut off from intercourse with his fellow-men, or, as we might put it, was boycotted. He could not enter any house, or come into contact with any person or thing without infecting them. He might not even touch food with his hands, which, owing to their uncleanness, had become quite useless. 'Food would be set for him on the ground, and he would then sit or kneel down, and, with his hands carefully held behind his back, would gnaw at it as best he could. In some cases he would be fed by another person, who with outstretched arm contrived to do it without touching the tabooed man; but the feeder was himself subjected to many severe restrictions, little less onerous than those which were imposed upon the other. In almost every populous village there lived a degraded wretch, the lowest of the low, who earned a sorry pittance by thus waiting upon the defiled.' He alone was allowed 'to associate at arm's length with one who had paid the last offices . . . to the dead. And when, the dismal term of his seclusion being over, the mourner was about to mix with his fellows once more, all the dishes he had used in his seclusion were diligently smashed, and all the garments he had worn were carefully thrown away.'

The taboo observances after bodily contact with the dead are the same over the whole of Polynesia, Melanesia and a part of Africa. Their most regular feature is the prohibition against those who have had such contact touching food themselves, and the consequent necessity for their being fed by other people. It is a remarkable fact that in Polynesia (though the report may perhaps refer only to Hawaii) priestly kings were subject to the same restriction while performing their sacred functions.¹ The case of the taboo upon the dead in Tonga offers a specially clear instance of the way in which the degree of prohibition varies according to the taboo power of the person upon whom the taboo is imposed. Thus anyone who touches a dead chief is unclean for ten months; but if he himself is a chief he is only tabooed for three, four, or five months according to the rank of the dead man; but if the dead man were the 'great divine chief', even the greatest chief would be tabooed for ten months. These savages believe firmly that anyone who violates the taboo ordinances is bound to fall ill and die; indeed they believe it so firmly that, in the opinion of an observer, 'no native ever made an experiment to prove the contrary'.²

Essentially the same prohibitions (though from our point of view they are more interesting) apply to those who have been in contact with the dead only in a metaphorical sense: the dead person's mourning relations, widowers and widows. The observances that we have so far mentioned may seem merely to give characteristic expression to the virulence of the taboo and its contagious power. But those which now follow give us a hint at the *reasons* for the taboo - both the ostensible ones and what we must regard as the deep-lying real ones.

'Among the Shuswap of British Columbia widows and widowers in mourning are secluded and forbidden to touch their own head or body; the cups and cooking vessels which they use may be used by no one else. . . . No hunter would come near such mourners, for their presence is unlucky. If their shadow were to fall on anyone, he would be taken ill at once. They employ thorn-bushes for bed and pillow . . . and thorn-bushes are also laid all around their beds.' This last measure is designed to keep the dead person's ghost at a distance. The same purpose is shown still more clearly in the usage reported from another North American tribe which provides that, after her husband's death, 'a widow would wear a breech-cloth made of dry bunch-grass for several days to prevent her husband's ghost having intercourse with her.' This suggests that contact 'in a metaphorical sense' is after all understood as being bodily contact, for the dead man's ghost does not leave his relations and does not cease to 'hover' round them during the time of mourning.

'Among the Agutainos, who inhabit Palawan, one of the Philippine Islands, a widow may not leave her hut for seven or eight days after the death; and even then she may only go out at an hour when she is not likely to meet anybody, for whoever looks upon her dies a sudden death. To prevent this fatal catastrophe, the widow knocks with a wooden peg on the trees as she goes along, thus warning people of her dangerous proximity; and the very trees on which she knocks soon die.' The nature of the danger feared from a widow such as this is made plain by another example. 'In the Mekeo district of British New Guinea a widower loses all his civil rights and becomes a social outcast, an object of fear and horror, shunned by all. He may not cultivate a garden, nor show himself in public, nor walk on the roads and paths. Like a wild beast he must skulk in the long grass and the bushes; and if he sees or hears anyone coming, especially a woman, he must hide behind a tree or a thicket.' This last hint makes it easy to trace the origin of the dangerous character of widowers or widows to the danger of *temptation*. A man who has lost his wife must resist a desire to find a substitute for her; a widow must fight against the same wish and is moreover liable, being without a lord and master, to arouse the desires of other men. Substitutive satisfactions of such a kind run counter to the sense of mourning and they would inevitably kindle the ghost's wrath.³

¹ Frazer (loc. cit.).

² Frazer (1911*b*, 140), quoting Mariner (1818).

³ The patient whose 'impossibilities' I compared with taboos earlier in this paper (see [page 2676](#)) told me that whenever she met anyone dressed in mourning in the street she was filled with indignation: such people, she thought, should be forbidden to go out.

One of the most puzzling, but at the same time instructive usages in connection with mourning is the prohibition against uttering the name of the dead person. This custom is extremely widespread, it is expressed in a variety of ways and has had important consequences. It is found not only among the Australians and Polynesians (who usually show us taboo observances in the best state of preservation), but also among 'peoples so widely separated from each other as the Samoyeds of Siberia and the Todas of southern India; the Mongols of Tartary and the Tuaregs of the Sahara; the Ainos of Japan and the Akamba and Nandi of central Africa; the Tinguianes of the Philippines and the inhabitants of the Nicobar Islands, of Borneo, of Madagascar, and of Tasmania.' (Frazer, 1911*b*, 353.) In some of these cases the prohibition and its consequences last only during the period of mourning, in others they are permanent; but it seems invariably to diminish in strictness with the passage of time.

The avoidance of the name of a dead person is as a rule enforced with extreme severity. Thus in some South American tribes it is regarded as a deadly insult to the survivors to mention the name of a dead relative in their presence, and the punishment for it is not less than that laid down for murder. (Ibid., 352.) It is not easy at first to see why the mention of the name should be regarded with such horror; but the dangers involved have given rise to a whole number of methods of evasion which are interesting and important in various ways. Thus the Masai in East Africa resort to the device of changing the dead man's name immediately after his death; he may then be mentioned freely under his new name while all the restrictions remain attached to the old one. This seems to presuppose that the dead man's ghost does not know and will not get to know his new name. The Adelaide and Encounter Bay tribes of South Australia are so consistently careful that after a death everyone bearing the same name as the dead man's, or a very similar one, changes it for another. In some instances, as for instance among certain tribes in Victoria and in North-West America, this is carried a step further, and after a death all the dead person's relations change their names, irrespective of any similarity in their sound. Indeed, among the Guaycurus in Paraguay, when a death had taken place, the chief used to change the name of every member of the tribe; and 'from that moment everybody remembered his new name just as if he had borne it all his life'.¹

Moreover, if the name of the dead man happens to be the same as that of an animal or common object, some tribes think it necessary to give these animals or objects new names, so that the use of the former names shall not recall the dead man to memory. This usage leads to a perpetual change of vocabulary, which causes much difficulty to the missionaries, especially when such changes are permanent. In the seven years which the missionary Dobrizhoffer spent among the Abipones of Paraguay, 'the native word for jaguar was changed thrice, and the words for crocodile, thorn, and the slaughter of cattle underwent similar though less varied vicissitudes'.² The dread of uttering a dead person's name extends, indeed, to an avoidance of the mention of anything in which the dead man played a part; and an important consequence of this process of suppression is that these peoples possess no tradition and no historical memory, so that any research into their early history is faced by the greatest difficulties. A number of these primitive races have, however, adopted compensatory usages which revive the names of dead persons after a long period of mourning by giving them to children, who are thus regarded as reincarnations of the dead.

¹ Frazer (1911*b*, 357), quoting an old Spanish observer.

² Frazer (1911*b*, 360), quoting Dobrizhoffer.

This taboo upon names will seem less puzzling if we bear in mind the fact that savages regard a name as an essential part of a man's personality and as an important possession: they treat words in every sense as things. As I have pointed out elsewhere, our own children do the same. They are never ready to accept a similarity between two words as having no meaning; they consistently assume that if two things are called by similar-sounding names this must imply the existence of some deep-lying point of agreement between them. Even a civilized adult may be able to infer from certain peculiarities in his own behaviour that he is not so far removed as he may have thought from attributing importance to proper names, and that his own name has become to a very remarkable extent bound up with his personality. So, too, psycho-analytic practice comes upon frequent confirmations of this in the evidence it finds of the importance of names in unconscious mental activities.¹

As was only to be expected, obsessional neurotics behave exactly like savages in relation to names. Like other neurotics, they show a high degree of 'complexive sensitiveness' in regard to uttering or hearing particular words and names; and their attitude towards their own names imposes numerous, and often serious, inhibitions upon them. One of these taboo patients of my acquaintance had adopted a rule against writing her own name, for fear that it might fall into the hands of someone who would then be in possession of a portion of her personality. She was obliged to fight with convulsive loyalty against the temptations to which her imagination subjected her, and so forbade herself 'to surrender any part of her person'. This included in the first place her name, and later extended to her handwriting, till finally she gave up writing altogether.

¹ Cf. Stekel and Abraham.

We shall no longer feel surprised, therefore, at savages regarding the name of a dead person as a portion of his personality and making it subject to the relevant taboo. So, too, uttering the name of a dead person is clearly a derivative of having contact with him. We may therefore turn to the wider problem of why such contact is submitted to so strict a taboo.

The most obvious explanation would point to horror roused by dead bodies and by the changes which quickly become visible in them. Some part must also be played in the matter by mourning for the dead person, since it must be a motive force in everything relating to him. But horror at the corpse clearly does not account for all the details of the taboo observances, and mourning cannot explain why the uttering of the dead man's name is an insult to his survivors. Mourning, on the contrary, tends to be preoccupied with the dead man, to dwell upon his memory and to preserve it as long as possible. Something other than mourning must be held responsible for the peculiarities of the taboo usages, something which has very different purposes in view. It is precisely the taboo upon names that gives us the clue to this unknown motive; and if the usages alone did not tell us, we should learn it from what the mourning savages say to us themselves.

For they make no disguise of the fact that they are *afraid* of the presence or of the return of the dead person's ghost; and they perform a great number of ceremonies to keep him at a distance or drive him off.¹ They feel that to utter his name is equivalent to invoking him and will quickly be followed by his presence.² And accordingly they do everything they can to avoid any such evocation. They disguise themselves so that the ghost shall not recognize them,³ or they change his name or their own; they are furious with reckless strangers who by uttering the ghost's name incite him against the survivors. It is impossible to escape the conclusion that, in the words of Wundt (1906, 49), they are victims to a fear of 'the dead man's soul which has become a demon'. Here, then, we seem to have found a confirmation of Wundt's view, which, as we have already seen (p. 2672), considers that the essence of taboo is a fear of demons.

¹ Frazer (1911*b*, 353) mentions the Tuaregs of the Sahara as an example of this explanation being given by the savages themselves.

² Subject, perhaps, to the condition that some of his bodily remains are still in existence. (*Ibid.*, 372.)

³ In the Nicobar Islands. (*Ibid.*, 358.)

This theory is based on a supposition so extraordinary that it seems at first sight incredible: the supposition, namely, that a dearly loved relative at the moment of his death changes into a demon, from whom his survivors can expect nothing but hostility and against whose evil desires they must protect themselves by every possible means. Nevertheless, almost all the authorities are at one in attributing these views to primitive peoples. Westermarck, who, in my opinion, takes far too little notice of taboo in his book on *The Origin and Development of the Moral Ideas*, actually writes in his chapter on 'Regard for the Dead': 'Generally speaking, my collection of facts has led me to the conclusion that the dead are more commonly regarded as enemies than friends, and that Professor Jevons and Mr. Grant Allen are mistaken in their assertion that, according to early beliefs, the malevolence of the dead is for the most part directed against strangers only, whereas they exercise a fatherly care over the lives and fortunes of their descendants and fellow clansmen.'¹

¹ Westermarck (1906-8, 2, 532 ff.). In his footnotes and in the section of the text which follows, the author gives copious confirmatory evidence, often of an extremely pertinent sort. For instance: 'Among the Maoris the nearest and most beloved relatives were supposed to have their natures changed by death, and to become malignant, even towards those they formerly loved. . . . Australian natives believed that a deceased person is malevolent for a long time after death, and the more nearly related the more he is feared. . . . According to ideas prevalent among the Central Eskimo, the dead are at first malevolent spirits who frequently roam around the villages, causing sickness and mischief and killing men by their touch; but subsequently they are supposed to attain rest and are no longer feared.'

In an interesting volume, Rudolf Kleinpaul (1898) has used the remnants among civilized races of the ancient belief in spirits to throw light on the relation between the living and the dead. He, too, reaches the final conclusion that the dead, filled with a lust for murder, sought to drag the living in their train. The dead slew; and the skeleton which we use to-day to picture the dead stands for the fact that they themselves were slayers. The living did not feel safe from the attacks of the dead till there was a sheet of water between them. That is why men liked to bury the dead on islands or on the farther side of rivers; and that, in turn, is the origin of such phrases as 'Here and in the Beyond'. Later, the malignity of the dead diminished and was restricted to special categories which had a particular right to feel resentment - such as murdered men, for instance, who in the form of evil spirits went in pursuit of their murderers, or brides who had died with their desires unsatisfied. But originally, says Kleinpaul, *all* of the dead were vampires, all of them had a grudge against the living and sought to injure them and rob them of their lives. It was from corpses that the concept of evil spirits first arose.

The hypothesis that after their death those most beloved were transformed into demons clearly raises further questions. What was it that induced primitive men to attribute such a change of feeling to those who had been dear to them? Why did they make them into demons? Westermarck (1906-8, 2, 534 f.) is of the opinion that these questions can be answered easily. 'Death is commonly regarded as the gravest of all misfortunes; hence the dead are believed to be exceedingly dissatisfied with their fate. According to primitive ideas a person only dies if he is killed - by magic if not by force - and such a death naturally tends to make the soul revengeful and ill-tempered. It is envious of the living and is longing for the company of its old friends; no wonder, then, that it sends them diseases to cause their death. . . . But the notion that the disembodied soul is on the whole a malicious being . . . is also, no doubt, intimately connected with the instinctive fear of the dead, which is in its turn the outcome of the fear of death.'

The study of psychoneurotic disorders suggests a more comprehensive explanation, which at the same time covers that put forward by Westermarck

When a wife has lost her husband or a daughter her mother, it not infrequently happens that the survivor is overwhelmed by tormenting doubts (to which we give the name of 'obsessive self-reproaches') as to whether she may not herself have been responsible for the death of this cherished being through some act of carelessness or neglect. No amount of recollection of the care she lavished on the sufferer, no amount of objective disproof of the accusation, serves to bring the torment to an end. It may be regarded as a pathological form of mourning, and with the passage of time it gradually dies away. The psycho-analytic investigation of such cases has revealed the secret motives of the disorder. We find that in a certain sense these obsessive self-reproaches are justified, and that this is why they are proof against contradictions and protests. It is not that the mourner was really responsible for the death or was really guilty of neglect, as the self-reproaches declare to be the case. None the less there was something in her - a wish that was unconscious to herself - which would not have been dissatisfied by the occurrence of death and which might actually have brought it about if it had had the power. And after death *has* occurred, it is against this unconscious wish that the reproaches are a reaction. In almost every case where there is an intense emotional attachment to a particular person we find that behind the tender love there is a concealed hostility in the unconscious. This is the classical example, the prototype, of the ambivalence of human emotions. This ambivalence is present to a greater or less amount in the innate disposition of everyone; normally, there is not so much of it as to produce the obsessive self-reproaches we are considering. Where, however, it is copiously present in the disposition, it will manifest itself precisely in the subject's relation to those of whom he is most fond, in the place, in fact, where one would least expect to find it. It must be supposed that the presence of a particularly large amount of this original emotional ambivalence is characteristic of the disposition of obsessional neurotics - whom I have so often brought up for comparison in this discussion upon taboo.

We have now discovered a motive which can explain the idea that the souls of those who have just died are transformed into demons and the necessity felt by survivors to protect themselves by taboos against their hostility. Let us suppose that the emotional life of primitive peoples is characterized by an amount of ambivalence as great as that which we are led by the findings of psycho-analysis to attribute to obsessional patients. It then becomes easy to understand how after a painful bereavement savages should be obliged to produce a reaction against the hostility latent in their unconscious similar to that expressed as obsessive self-reproach in the case of neurotics. But this hostility, distressingly felt in the unconscious as satisfaction over the death, is differently dealt with among primitive peoples. The defence against it takes the form of displacing it on to the object of the hostility, on to the dead themselves. This defensive procedure, which is a common one both in normal and in pathological mental life, is known as a '*projection*'. The survivor thus denies that he has ever harboured any hostile feelings against the dead loved one; the soul of the dead harbours them instead and seeks to put them into action during the whole period of mourning. In spite of the successful defence which the survivor achieves by means of projection, his emotional reaction shows the characteristics of punishment and remorse, for he is the subject of fears and submits to renunciations and restrictions, though these are in part disguised as measures of protection against the hostile demon. Once again, therefore, we find that the taboo has grown up on the basis of an ambivalent emotional attitude. The taboo upon the dead arises, like the others, from the contrast between conscious pain and unconscious satisfaction over the death that has occurred. Since such is the origin of the ghost's resentment, it follows naturally that the survivors who have the most to fear will be those who were formerly its nearest and dearest.

In this respect taboo observances, like neurotic symptoms, have a double sense. On the one hand, in their restrictive character, they are expressions of mourning; but on the other hand they clearly betray - what they seek to conceal - hostility against the dead disguised as self-defence. We have already learned that certain taboos arise out of fear of temptation. The fact that a dead man is helpless is bound to act as an encouragement to the survivor to give free rein to his hostile passions, and that temptation must be countered by a prohibition.

Westermarck is right in insisting that savages draw no distinction between violent and natural death. In the view of unconscious thinking, a man who has died a natural death is a murdered man: evil wishes have killed him.¹ Anyone who investigates the origin and significance of dreams of the death of loved relatives (of parents or brothers or sisters) will be able to convince himself that dreamers, children and savages are at one in their attitude towards the dead - an attitude based upon emotional ambivalence.

At the beginning of this essay disagreement was expressed with Wundt's opinion that the essence of taboo was a fear of demons. Yet we have now assented to an explanation that derives the taboo upon the dead from a fear of the soul of the dead person transformed into a demon. The apparent contradiction can easily be resolved. It is true that we have accepted the presence of demons, but not as something ultimate and psychologically unanalysable. We have succeeded, as it were, in getting behind the demons, for we have explained them as projections of hostile feelings harboured by the survivors against the dead.

Both of the two sets of feelings (the affectionate and the hostile), which, as we have good reason to believe, exist towards the dead person, seek to take effect at the time of the bereavement, as mourning and as satisfaction. There is bound to be a conflict between these two contrary feelings; and, since one of the two, the hostility, is wholly or for the greater part unconscious, the outcome of the conflict cannot be to subtract, as it were, the feeling with the lesser intensity from that with the greater and to establish the remainder in consciousness - as occurs, for instance, when one forgives a slight that one has received from someone of whom one is fond. The process is dealt with instead by the special psychical mechanism known in psycho-analysis, as I have said, by the name of 'projection'. The hostility, of which the survivors know nothing and moreover wish to know nothing, is ejected from internal perception into the external world, and thus detached from them and pushed on to someone else. It is no longer true that they are rejoicing to be rid of the dead man; on the contrary, they are mourning for him; but, strange to say, *he* has turned into a wicked demon ready to gloat over their misfortunes and eager to kill them. It then becomes necessary for them, the survivors, to defend themselves against this evil enemy; they are relieved of pressure from within, but have only exchanged it for oppression from without.

¹ Cf. the next essay in this volume.

It cannot be disputed that this process of projection, which turns a dead man into a malignant enemy, is able to find support in any real acts of hostility on his part that may be recollected and felt as a grudge against him: his severity, his love of power, his unfairness, or whatever else may form the background of even the tenderest of human relationships. But it cannot be such a simple matter as that. This factor alone cannot explain the creation of demons by projection. The faults of the dead no doubt provide a part of the explanation of the survivors' hostility; but they would not operate in this way unless the survivors had first developed hostility on their own account. The moment of death, moreover, would certainly seem to be a most inappropriate occasion for recalling any justifiable grounds of complaint that might exist. It is impossible to escape the fact that the true determining factor is invariably *unconscious* hostility. A hostile current of feeling such as this against a person's nearest and dearest relatives may remain latent during their lifetime, that is, its existence may not be betrayed to consciousness either directly or through some substitute. But when they die this is no longer possible and the conflict becomes acute. The mourning which derives from an intensification of the affectionate feelings becomes on the one hand more impatient of the latent hostility and, on the other hand, will not allow it to give rise to any sense of satisfaction. Accordingly, there follow the repression of the unconscious hostility by the method of projection and the construction of the ceremonial which gives expression to the fear of being punished by the demons. When in course of time the mourning runs its course, the conflict grows less acute, so that the taboo upon the dead is able to diminish in severity or sink into oblivion.

(4)

Having thus explained the basis of the exceedingly instructive taboo upon the dead, we must not omit to add a few remarks that may help to increase our understanding of taboo in general.

The projection of unconscious hostility on to demons in the case of the taboo upon the dead is only a single instance of a number of processes to which the greatest influence must be attributed in the shaping of the primitive mind. In the case we have been dealing with, projection served the purpose of dealing with an emotional conflict; and it is employed in the same way in a large number of psychical situations that lead to neuroses. But projection was not created for the purpose of defence; it also occurs where there is no conflict. The projection outwards of internal perceptions is a primitive mechanism, to which, for instance, our sense perceptions are subject, and which therefore normally plays a very large part in determining the form taken by our external world. Under conditions whose nature has not yet been sufficiently established, internal perceptions of emotional and thought processes can be projected outwards in the same way as sense perceptions; they are thus employed for building up the external world, though they should by rights remain part of the *internal* world. This may have some genetic connection with the fact that the function of attention was originally directed not towards the internal world but towards the stimuli that stream in from the external world, and that that function's only information upon endopsychic processes was received from feelings of pleasure and unpleasure. It was not until a language of abstract thought had been developed, that is to say, not until the sensory residues of verbal presentations had been linked to the internal processes, that the latter themselves gradually became capable of being perceived. Before that, owing to the projection outwards of internal perceptions, primitive men arrived at a picture of the external world which we, with our intensified conscious perception, have now to translate back into psychology.

The projection of their own evil impulses into demons is only one portion of a system which constituted the *Weltanschauung* of primitive peoples, and which we shall come to know as 'animism' in the following essay. There we shall have to investigate that system's psychological characteristics, and we shall do so once again by reference to the similar systems which we find constructed by neurotics. For the moment I will only say that the prototype of all such systems is what we have termed the 'secondary revision' of the content of dreams. And we must not forget that, at and after the stage at which systems are constructed, two sets of reasons can be assigned for every psychical event that is consciously judged - one set belonging to the system and the other set real but unconscious.¹

Wundt (1906, 129) remarks that 'among the activities attributed by myths all over the world to demons, the harmful predominate, so that in popular belief bad demons are clearly older than good ones'. It is quite possible that the whole concept of demons was derived from the important relation of the living to the dead. The ambivalence inherent in that relation was expressed in the subsequent course of human development by the fact that, from the same root, it gave rise to two completely opposed psychical structures: on the one hand fear of demons and ghosts and on the other hand veneration of ancestors.² The fact that demons are always regarded as the spirits of those who have died *recently* shows better than anything the influence of mourning on the origin of the belief in demons. Mourning has a quite specific psychical task to perform: its function is to detach the survivors' memories and hopes from the dead. When this has been achieved, the pain grows less and with it the remorse and self-reproaches and consequently the fear of the demon as well. And the same spirits who to begin with were feared as demons may now expect to meet with friendlier treatment; they are revered as ancestors and appeals are made to them for help.

¹ The projected creations of primitive men resemble the personifications constructed by creative writers; for the latter externalize in the form of separate individuals the opposing instinctual impulses struggling within them.

² In the course of psycho-analyses of neurotics who suffer (or who suffered in their childhood) from fear of ghosts, it is often possible to show without much difficulty that the ghosts are disguises for the patient's parents. Cf. in this connection a paper upon 'Sexual Ghosts' by Haeberlin (1912). Here the person concerned was not the subject's parent (who was dead) but someone else of erotic significance to him.

If we follow the changing relations between survivors and the dead through the course of ages, it becomes obvious that there has been an extraordinary diminution in ambivalence. It is now quite easy to keep down the unconscious hostility to the dead (though its existence can still be traced) without any particular expenditure of psychical energy. Where, in earlier times, satisfied hatred and pained affection fought each other, we now find that a kind of scar has been formed in the shape of piety, which declares '*de mortuis nil nisi bonum*'. It is only neurotics whose mourning for the loss of those dear to them is still troubled by obsessive self-reproaches - the secret of which is revealed by psycho-analysis as the old emotional ambivalence. We need not discuss here how this alteration came about or how much share in it is due to a constitutional modification and how much to a real improvement in family relations. But this example suggests the probability that *the psychical impulses of primitive peoples were characterized by a higher amount of ambivalence than is to be found in modern civilized man. It is to be supposed that as this ambivalence diminished, taboo (a symptom of the ambivalence and a compromise between two conflicting impulses) slowly disappeared* Neurotics, who are obliged to reproduce the struggle and the taboo resulting from it, may be said to have inherited an archaic constitution as an atavistic vestige; the need to compensate for this at the behest of civilization is what drives them to their immense expenditure of mental energy.

And here we may recall the obscure and puzzling statement by Wundt on the double meaning of the word taboo: 'sacred' and 'unclean'. (See above.) Originally, according to him, the word did not possess these two meanings, but described 'what is demonic', 'what may not be touched', thus stressing an important characteristic common to both the extreme concepts. The persistence, however (he added), of this common characteristic was evidence that the ground covered by the two - the sacred and the unclean - was originally one and did not become differentiated until later.

Our discussions, on the contrary, lead us to the simple conclusion that the word 'taboo' had a double meaning from the very first and that it was used to designate a particular kind of ambivalence and whatever arose from it. 'Taboo' is itself an ambivalent word; and one feels on looking back that the well-attested meaning of the word should alone have made it possible to infer - what has actually been arrived at as a result of extensive researches - that the prohibitions of taboo are to be understood as consequences of an emotional ambivalence. Study of the earliest languages has taught us that there were once many such words, which expressed contrary ideas and in a sense (though not in quite the same sense as the word 'taboo') were ambivalent.¹ Slight modifications in the pronunciation of the antithetical 'primal word' made it possible subsequently to give separate verbal expression to the two contrary ideas which were originally combined in it.

The word 'taboo' met with a different fate. As the importance of the ambivalence denoted by it diminished, the word itself, or rather the words analogous to it, fell out of use. I hope to be able, in a later connection, to make it probable that a definite historical chain of events is concealed behind the fate of this concept: that the word was at first attached to certain quite specific human relations which were characterized by great emotional ambivalence, and that its use then spread on to other analogous relations.

If I am not mistaken, the explanation of taboo also throws light on the nature and origin of *conscience*. It is possible, without any stretching of the sense of the terms, to speak of a taboo conscience or, after a taboo has been violated, of a taboo sense of guilt. Taboo conscience is probably the earliest form in which the phenomenon of conscience is met with.

For what is 'conscience'? On the evidence of language it is related to that of which one is 'most certainly conscious'. Indeed, in some languages the words for 'conscience' and 'consciousness' can scarcely be distinguished.

¹ Cf. my review of Abel's 'Antithetical Meaning of Primal Words'.

Conscience is the internal perception of the rejection of a particular wish operating within us. The stress, however, is upon the fact that this rejection has no need to appeal to anything else for support, that it is quite 'certain of itself'. This is even clearer in the case of consciousness of guilt - the perception of the internal condemnation of an act by which we have carried out a particular wish. To put forward any reason for this would seem superfluous: anyone who has a conscience must feel within him the justification for the condemnation, must feel the self-reproach for the act that has been carried out. This same characteristic is to be seen in the savage's attitude towards taboo. It is a command issued by conscience; any violation of it produces a fearful sense of guilt which follows as a matter of course and of which the origin is unknown.¹

Thus it seems probable that conscience too arose, on a basis of emotional ambivalence, from quite specific human relations to which this ambivalence was attached; and that it arose under the conditions which we have shown to apply in the case of taboo and of obsessional neurosis - namely, that one of the opposing feelings involved shall be unconscious and kept under repression by the compulsive domination of the other one. This conclusion is supported by several things we have learnt from the analysis of neuroses.

In the first place, we have found that a feature in the character of obsessional neurotics is a scrupulous conscientiousness which is a symptom reacting against the temptation lurking in their unconscious. If their illness becomes more acute, they develop a sense of guilt of the most intense degree. In fact, one may venture to say that if we cannot trace the origin of the sense of guilt in obsessional neurotics, there can be no hope of our ever tracing it. This task can be directly achieved in the case of individual neurotic patients, and we may rely upon reaching a similar solution by inference in the case of primitive peoples.

¹ The sense of guilt in the case of taboos is not in the least diminished if the violation occurs unwittingly. (Cf. the instances above.) An interesting parallel is found in Greek mythology: the guilt of Oedipus was not palliated by the fact that he incurred it without his knowledge and even against his intention.

In the second place, we cannot help being struck by the fact that a sense of guilt has about it much of the nature of anxiety: we could describe it without any misgivings as 'dread of conscience'. But the anxiety points to unconscious sources. The psychology of the neuroses has taught us that, if wishful impulses are repressed, their libido is transformed into anxiety. And this reminds us that there is something unknown and unconscious in connection with the sense of guilt, namely the reasons for the act of repudiation. The character of anxiety that is inherent in the sense of guilt corresponds to this unknown factor.

Since taboos are mainly expressed in prohibitions, the underlying presence of a *positive* current of desire may occur to us as something quite obvious and calling for no lengthy proofs based on the analogy of the neuroses. For, after all, there is no need to prohibit something that no one desires to do, and a thing that is forbidden with the greatest emphasis must be a thing that is desired. If we were to apply this plausible thesis to our primitive peoples, we should be led to the conclusion that some of their strongest temptations were to kill their kings and priests, to commit incest, to maltreat the dead, and so on - which seems scarcely probable. And we should be met with the most positive contradiction if we were to apply the same thesis to instances in which we ourselves seem most clearly to hear the voice of conscience. We should maintain with the most absolute certainty that we feel not the slightest temptation to violate any of these prohibitions - the commandment to 'do no murder', for instance - and that we feel nothing but horror at the notion of violating them.

If, however, we were to admit the claims thus asserted by our conscience, it would follow, on the one hand, that these prohibitions would be superfluous - both taboo and our own moral prohibitions - and, on the other hand, the fact of conscience would remain unexplained and no place would be left for the relations between conscience, taboo and neurosis. In other words, we should be back in the state of knowledge we were in before we approached the problem from the psycho-analytic angle.

Suppose, on the other hand, that we were to take into account the finding arrived at by psycho-analysis from the dreams of normal people, to the effect that we ourselves are subject, more strongly and more often than we suspect, to a temptation to kill someone and that that temptation produces psychical effects even though it remains out of sight of our consciousness. Suppose, again, that we were to recognize the compulsive observances of certain neurotics as being guarantees against an intensified impulse to murder or as being self-punishments on account of it. In that case we should have to attach still greater importance to our thesis that where there is a prohibition there must be an underlying desire. We should have to suppose that the desire to murder is actually present in the unconscious and that neither taboos nor moral prohibitions are psychologically superfluous but that on the contrary they are explained and justified by the existence of an ambivalent attitude towards the impulse to murder.

One of the characteristics of this ambivalent relation which I have repeatedly stressed as fundamental - the fact that the positive current of desire is an unconscious one - opens the way to further considerations and to further possible explanations. Psychical processes in the unconscious are not in every respect identical with those with which our conscious mind is familiar; they enjoy some remarkable liberties that are forbidden to the latter. An unconscious impulse need not have arisen at the point where it makes its appearance; it may arise from some quite other region and have applied originally to quite other persons and connections; it may have reached the place at which it attracts our attention though the mechanism of 'displacement'. Owing, moreover, to the indestructibility and insusceptibility to correction which are attributes of unconscious processes, it may have survived from very early times to which it was appropriate into later times and circumstances in which its manifestations are bound to seem strange. These are no more than hints, but if they were attentively developed their importance for our understanding of the growth of civilization would become apparent.

Before I conclude this discussion, a further point must not be overlooked which will pave the way for later inquiries. In maintaining the essential similarity between taboo prohibitions and moral prohibitions, I have not sought to dispute the fact that there must be a psychological difference between them. The only possible reason why the prohibitions no longer take the form of taboos must be some change in the circumstances governing the ambivalence underlying them.

In our analytical examination of the problems of taboo we have hitherto allowed ourselves to be led by the points of agreement that we have been able to show between it and obsessional neurosis. But after all taboo is not a neurosis but a social institution. We are therefore faced with the task of explaining what difference there is in principle between a neurosis and a cultural creation such as taboo.

Once again I will take a single fact as my starting-point. It is feared among primitive peoples that the violation of a taboo will be followed by a punishment, as a rule by some serious illness or by death. The punishment threatens to fall on whoever was responsible for violating the taboo. In obsessional neuroses the case is different. What the patient fears if he performs some forbidden action is that a punishment will fall not on himself but on someone else. This person's identity is as a rule left unstated, but can usually be shown without difficulty by analysis to be one of those closest and most dear to the patient. Here, then, the neurotic seems to be behaving altruistically and the primitive man egoistically. Only if the violation of a taboo is not automatically avenged upon the wrong-doer does a collective feeling arise among savages that they are all threatened by the outrage; and they thereupon hasten to carry out the omitted punishment themselves. There is no difficulty in explaining the mechanism of this solidarity. What is in question is fear of an infectious example, of the temptation to imitate - that is, of the contagious character of taboo. If one person succeeds in gratifying the repressed desire, the same desire is bound to be kindled in all the other members of the community. In order to keep the temptation down, the envied transgressor must be deprived of the fruit of his enterprise; and the punishment will not infrequently give those who carry it out an opportunity of committing the same outrage under colour of an act of expiation. This is indeed one of the foundations of the human penal system and it is based, no doubt correctly, on the assumption that the prohibited impulses are present alike in the criminal and in the avenging community. In this, psycho-analysis is no more than confirming the habitual pronouncement of the pious: we are all miserable sinners.

How, then, are we to account for the unexpected nobility of mind of the neurotic, who fears nothing on his own account but everything for someone he loves? Analytical inquiry shows that this attitude is not primary. Originally, that is to say at the beginning of the illness, the threat of punishment applied, as in the case of savages, to the patient himself; he was invariably in fear for his own life; it was not until later that the mortal fear was displaced on to another and a loved person. The process is a little complicated, but we can follow it perfectly. At the root of the prohibition there is invariably a hostile impulse against someone the patient loves - a wish that that person should die. This impulse is repressed by a prohibition and the prohibition is attached to some particular act, which, by displacement, represents, it may be, a hostile act against the loved person. There is a threat of death if this act is performed. But the process goes further, and the original *wish* that the loved person may die is replaced by *fear* that he may die. So that when the neurosis appears to be so tenderly altruistic, it is merely *compensating* for an underlying contrary attitude of brutal egoism. We may describe as 'social' the emotions which are determined by showing consideration for another person without taking him as a sexual object. The receding into the background of these social factors may be stressed as a fundamental characteristic of the neurosis, though one which is later disguised by overcompensation.

I do not propose to linger over the origin of these social impulses and their relation to the other basic human instincts but shall proceed to illustrate the second main characteristic of the neurosis by means of another example. In the forms which it assumes, taboo very closely resembles the neurotic's fear of touching, his 'touching phobia'. Now, in the case of the neurosis the prohibition invariably relates to touching of a *sexual* kind, and psycho-analysis has shown that it is in general true that the instinctual forces that are diverted and displaced in neuroses have a sexual origin. In the case of taboo the prohibited touching is obviously not to be understood in an exclusively sexual sense but in the more general sense of attacking, of getting control, and of asserting oneself. If there is a prohibition against touching a chief or anything that has been in contact with him, this means that an inhibition is to be laid on the same impulse which expresses itself on other occasions in keeping a suspicious watch upon the chief or even in ill-treating him physically before his coronation. (See above.) *Thus the fact which is characteristic of the neurosis is the preponderance of the sexual over the social instinctual elements.* The social instincts, however, are themselves derived from a combination of egoistic and erotic components into wholes of a special kind.

This single comparison between taboo and obsessional neurosis is enough to enable us to gather the nature of the relation between the different forms of neurosis and cultural institutions, and to see how it is that the study of the psychology of the neuroses is important for an understanding of the growth of civilization.

The neuroses exhibit on the one hand striking and far-reaching points of agreement with those great social institutions, art, religion and philosophy. But on the other hand they seem like distortions of them. It might be maintained that a case of hysteria is a caricature of a work of art, that an obsessional neurosis is a caricature of a religion and that a paranoid delusion is a caricature of a philosophical system. The divergence resolves itself ultimately into the fact that the neuroses are asocial structures; they endeavour to achieve by private means what is effected in society by collective effort. If we analyse the instincts at work in the neuroses, we find that the determining influence in them is exercised by instinctual forces of sexual origin; the corresponding cultural formations, on the other hand, are based upon social instincts, originating from the combination of egoistic and erotic elements. Sexual needs are not capable of uniting men in the same way as are the demands of self-preservation. Sexual satisfaction is essentially the private affair of each individual.

The asocial nature of neuroses has its genetic origin in their most fundamental purpose, which is to take flight from an unsatisfying reality into a more pleasurable world of phantasy. The real world, which is avoided in this way by neurotics, is under the sway of human society and of the institutions collectively created by it. To turn away from reality is at the same time to withdraw from the community of man.

III

ANIMISM, MAGIC AND THE OMNIPOTENCE OF THOUGHTS

(1)

Writings that seek to apply the findings of psycho-analysis to topics in the field of the mental sciences have the inevitable defect of offering too little to readers of both classes. Such writings can only be in the nature of an instigation: they put before the specialist certain suggestions for him to take into account in his own work. This defect is bound to be extremely evident in an essay which will attempt to deal with the immense domain of what is known as '*animism*'.¹

Animism is, in its narrower sense, the doctrine of souls, and, in its wider sense, the doctrine of spiritual beings in general. The term '*animatism*' has also been used to denote the theory of the living character of what appear to us to be inanimate objects, and the terms '*animalism*' and '*manism*' occur as well in this connection. The word '*animism*', originally used to describe a particular philosophical system, seems to have been given its present meaning by Tylor.²

¹ The necessity for a concise treatment of the material involves the omission of any elaborate bibliography. Instead, I will merely refer to the standard works of Herbert Spencer, J. G. Frazer, Andrew Lang, E. B. Tylor and Wilhelm Wundt, from which all that I have to say about animism and magic is derived. My own contribution is visible only in my selection both of material and of opinions.

² Cf. Tylor (1891, 1, 425), Wundt (1906, 173).

What led to the introduction of these terms was a realization of the highly remarkable view of nature and the universe adopted by the primitive races of whom we have knowledge, whether in past history or at the present time. They people the world with innumerable spiritual beings both benevolent and malignant; and these spirits and demons they regard as the causes of natural phenomena and they believe that not only animals and plants but all the inanimate objects in the world are animated by them. A third, and perhaps the most important, article of this primitive 'philosophy of nature' strikes us as less strange, since, while we have retained only a very limited belief in the existence of spirits and explain natural phenomena by the agency of impersonal physical forces, we ourselves are not very far removed from this third belief. For primitive peoples believe that human individuals are inhabited by similar spirits. These souls which live in human beings can leave their habitations and migrate into other human beings; they are the vehicle of mental activities and are to a certain extent independent of their bodies. Originally souls were pictured as very similar to persons and only in the course of a long development have they lost their material characteristics and become to a high degree 'spiritualized'.¹

Most authorities incline to the view that these ideas of a soul are the original nucleus of the animistic system, that spirits are only souls that have made themselves independent, and that the souls of animals, plants and objects were constructed on the analogy of human souls.

How did primitive men arrive at the peculiar dualistic views on which the animistic system is based? It is supposed that they did so by observing the phenomena of sleep (including dreams) and of death which so much resembles it, and by attempting to explain those states, which are of such close concern to every one. The chief starting-point of this theorizing must have been the problem of death. What primitive man regarded as the natural thing was the indefinite prolongation of life - immortality. The idea of death was only accepted late, and with hesitancy. Even for us it is lacking in content and has no clear connotation. There have been very lively but inconclusive discussions upon the part that may have been played in the formation of the basic doctrines of animism by such other observed or experienced facts as dream-pictures, shadows, mirror images, and so on.²

¹ Wundt (1906), Chapter IV, 'Die Seelenvorstellungen'.

² Cf. Wundt, Herbert Spencer, as well as the general articles in the *Encyclopaedia Britannica* (1910-11) on 'Animism', 'Mythology', etc.

It has been regarded as perfectly natural and not in the least puzzling that primitive man should have reacted to the phenomena which aroused his speculations by forming the idea of the soul and then of extending it to objects in the external world. In discussing the fact that the same animistic ideas have emerged among the most various races and at every period, Wundt (1906, 154) declares that 'they are the necessary psychological product of a mythopoeic consciousness . . . and in this sense, therefore, primitive animism must be regarded as the spiritual expression of the natural state of man, so far as it is accessible to our observation'. The justification for attributing life to inanimate objects was already stated by Hume in his *Natural History of Religion*: 'There is an universal tendency among mankind to conceive all beings like themselves, and to transfer to every object those qualities with which they are familiarly acquainted, and of which they are intimately conscious.'¹

Animism is a system of thought. It does not merely give an explanation of a particular phenomenon, but allows us to grasp the whole universe as a single unity from a single point of view. The human race, if we are to follow the authorities, have in the course of ages developed three such systems of thought - three great pictures of the universe: animistic (or mythological), religious and scientific. Of these, animism, the first to be created, is perhaps the one which is most consistent and exhaustive and which gives a truly complete explanation of the nature of the universe. This first human *Weltanschauung* is a *psychological* theory. It would go beyond our present purpose to show how much of it still persists in modern life, either in the debased form of superstition or as the living basis of our speech, our beliefs and our philosophies.

With these three stages in mind, it may be said that animism itself is not yet a religion but contains the foundations on which religions are later built. It is obvious, too, that myths are based on animistic premises, though the details of the relation between myths and animism seem to be unexplained in some essential respects.

¹ Quoted by Tylor (1891, 1, 477).

(2)

Our psycho-analytic approach to the subject, however, is from another side. It is not to be supposed that men were inspired to create their first system of the universe by pure speculative curiosity. The practical need for controlling the world around them must have played its part. So we are not surprised to learn that, hand in hand with the animistic system, there went a body of instructions upon how to obtain mastery over men, beasts and things - or rather, over their spirits. These instructions go by the names of 'sorcery [*Zauberei*]' and 'magic [*Magie*]'. Reinach (1905-12, 2, xv) describes them as the 'strategy of animism'; I should prefer, following Hubert and Mauss (1904), to regard them as its technique.

Can the concepts of sorcery and magic be distinguished? Perhaps - if we are prepared to show a somewhat arbitrary disregard for the fluctuations of linguistic usage. Sorcery, then, is essentially the art of influencing spirits by treating them in the same way as one would treat men in like circumstances: appeasing them, making amends to them, propitiating them, intimidating them, robbing them of their power, subduing them to one's will - by the same methods that have proved effective with living men. Magic, on the other hand, is something different: fundamentally, it disregards spirits and makes use of special procedures and not of everyday psychological methods. It is easy to guess that magic is the earlier and more important branch of animistic technique; for magical methods can, among others, be used in dealing with spirits,¹ and magic can be applied as well in cases where, as it seems to us, the process of spiritualizing Nature has not yet been carried out.

Magic has to serve the most varied purposes - it must subject natural phenomena to the will of man, it must protect the individual from his enemies and from dangers and it must give him power to injure his enemies. But the principle on the presumption of which magical action is based - or, more properly, the principle of magic - is so striking that none of the authorities has failed to recognize it. Tylor, if we leave on one side an accompanying moral judgement, states it in its most succinct form as mistaking an ideal connection for a real one. I will illustrate this feature from two groups of magical acts.

¹ If a spirit is scared away by making a noise and shouting, the action is one purely of sorcery; if compulsion is applied to it by getting hold of its name, magic has been used against it.

One of the most widespread magical procedures for injuring an enemy is by making an effigy of him from any convenient material. Whether the effigy resembles him is of little account: any object can be 'made into' an effigy of him. Whatever is then done to the effigy, the same thing happens to the detested original; whatever part of the former's body is damaged, the same part of the latter's becomes diseased. The same magical technique may be employed, not only for purposes of private enmity, but also for pious ends and for giving help to gods against malignant demons. I will quote from Frazer (1911a, 1, 67): 'Every night when the sun-god Ra sank down to his home in the glowing west he was assailed by hosts of demons under the leadership of the arch-fiend Apepi. All night long he fought them, and sometimes by day the powers of darkness sent up clouds even into the blue Egyptian sky to obscure his light and weaken his power. To aid the sun-god in this daily struggle, a ceremony was daily performed in his temple at Thebes. A figure of his foe Apepi, represented as a crocodile with a hideous face or a serpent with many coils, was made of wax, and on it the demon's name was written in green ink. Wrapt in a papyrus case, on which another likeness of Apepi had been drawn in green ink, the figure was then tied up with black hair, spat upon, hacked with a stone knife, and cast on the ground. There the priest trod on it with his left foot again and again, and then burnt it in a fire made of a certain plant or grass. When Apepi himself had thus been effectually disposed of, waxen effigies of each of his principal demons, and of their fathers, mothers and children, were made and burnt in the same way. The service, accompanied by the recitation of certain prescribed spells, was repeated not merely morning, noon and night, but whenever a storm was raging, or heavy rain had set in, or black clouds were stealing across the sky to hide the sun's bright disc. The fiends of darkness, clouds, and rain felt the injuries inflicted on their images as if they had been done to themselves; they passed away, at least for a time, and the beneficent sun-god shone out triumphant once more.'¹

¹ It seems probable that the biblical prohibition against making an image of any living thing originated, not from any objection to the plastic arts, but from a desire to deprive magic (which was abominated by the Hebrew religion) of one of its tools. Cf. Frazer (1911a, 1, 87 *n.*).

From the vast number of magical acts having a similar basis I will only draw attention to two more, which have played a large part among primitive peoples of every age and which persist to some degree in the myths and cults of higher stages of civilization - that is, rituals for producing rain and fertility. Rain is produced magically by imitating it or the clouds and storms which give rise to it, by 'playing at rain', one might almost say. In Japan, for instance, 'a party of Ainos will scatter water by means of sieves, while others will take a porringer, fit it up with sails and oars as if it were a boat, and then push or draw it about the village and gardens'. In the same way, the fertility of the earth is magically promoted by a dramatic representation of human intercourse. Thus, to take one from a countless number of instances, 'in some parts of Java, at the season when the bloom will soon be on the rice, the husbandman and his wife visit their fields by night and there engage in sexual intercourse' to encourage the fertility of the rice by their example.¹ There is a dread, however, that prohibited, incestuous sexual relations may cause a failure of the crops and make the earth sterile.²

Certain negative observances, that is, magical precautions, must be included in this first group. 'When a Dyak village has turned out to hunt wild pigs in the jungle, the people who stay at home may not touch oil or water with their hands during the absence of their friends; for if they did so, the hunters would all be "butter-fingered" and the prey would slip through their hands.'³ Or again, 'while a Gilyak hunter is pursuing game in the forest, his children at home are forbidden to make drawings on wood or on sand; for they fear that if the children did so, the paths in the forest would become as perplexed as the lines in the drawings, so that the hunter might lose his way and never return.'⁴

¹ Frazer (1911a, 2, 98).

² An echo of this is to be found in the *Oedipus Rex* of Sophocles.

³ Frazer (1911a, 1, 120).

⁴ Frazer (1911a, 1, 122).

In these last, as in so many other instances of the workings of magic, the element of distance is disregarded; in other words, telepathy is taken for granted. We shall find no difficulty, therefore, in understanding this characteristic of magic.

There can be no doubt what is to be regarded as the operative factor in all these examples. It is the *similarity* between the act performed and the result expected. For this reason Frazer describes this sort of magic as 'imitative' or 'homoeopathic'. If I wish it to rain, I have only to do something that looks like rain or is reminiscent of rain. At a later stage of civilization, instead of this rain-magic, processions will be made to a temple and prayers for rain will be addressed to the deity living in it. Finally, this religious technique will in its turn be given up and attempts will be made to produce effects in the atmosphere which will lead to rain.

In a second group of magical acts the principle of similarity plays no part, and its place is taken by another one, the nature of which will at once become clear from the following examples.

There is another procedure by which an enemy can be injured. One gets possession of some of his hair or nails or other waste products or even a piece of his clothing, and treats them in some hostile way. It is then exactly as though one had got possession of the man himself; and he himself experiences whatever it is that has been done to the objects that originated from him. In the view of primitive man, one of the most important parts of a person is his name. So that if one knows the name of a man or of a spirit, one has obtained a certain amount of power over the owner of the name. This is the origin of the remarkable precautions and restrictions in the use of names which we have already touched upon in the essay on taboo. (See p. 2699 ff.) In these examples the place of similarity is evidently taken by affinity.

The higher motives for cannibalism among primitive races have a similar origin. By incorporating parts of a person's body through the act of eating, one at the same time acquires the qualities possessed by him. This leads in certain circumstances to precautions and restrictions in regard to diet. A woman who is with child will avoid eating the flesh of certain animals for fear that any undesirable qualities they may have (cowardice, for instance) might be passed over to the child that is nourished by her. The magical power is not affected even if the connection between the two objects has already been severed or even if the contact occurred only on a single important occasion. For instance, the belief that there is a magical bond between a wound and the weapon which caused it may be traced unaltered for thousands of years. If a Melanesian can obtain possession of the bow which caused his wound, he will keep it carefully in a cool place so as to reduce the inflammation of the wound. But if the bow was left in the enemy's possession, it will undoubtedly be hung up close to the fire so that the wound may become thoroughly hot and inflamed. Pliny (in his *Natural History*, Book xxviii) tells us that 'if you have wounded a man and are sorry for it, you have only to spit on the hand that gave the wound, and the pain of the sufferer will be instantly alleviated'. Francis Bacon (in his *Sylva Sylvarum*) mentions that 'it is constantly received and avouched that the anointing of the weapon that maketh the wound will heal the wound itself'. English country people are said even to day to follow this prescription, and if they cut themselves with a scythe carefully keep the instrument clean, to prevent the wound from festering. 'At Norwich in June 1902 a woman named Matilda Henry accidentally ran a nail into her foot. Without examining the wound, or even removing her stocking, she caused her daughter to grease the nail, saying that if this were done no harm would come of the hurt. A few days afterwards she died of lockjaw' - as a result of this displaced antisepsis. (Frazer, *ibid.*, 203.)

The last group of instances exemplify what Frazer distinguishes from 'imitative' magic under the name of 'contagious' magic. What is believed to be their effective principle is no longer similarity but spatial connection, contiguity, or at least *imagined* contiguity - the recollection of it. Since, however, similarity and contiguity are the two essential principles of processes of association, it appears that the true explanation of all the folly of magical observances is the domination of the association of ideas. The aptness of Tylor's description of magic which I have already quoted now becomes evident: mistaking an ideal connection for a real one. Frazer (1911a, 1, 420) has put it almost in the same words: 'Men mistook the order of their ideas for the order of nature, and hence imagined that the control which they have, or seem to have, over their thoughts, permitted them to exercise a corresponding control over things.'

We shall at first be surprised to learn that this illuminating explanation of magic has been rejected by some writers as unsatisfactory (e.g. Thomas, 1910-11a). On reflection, however, it will be seen that the criticism is justified. The associative theory of magic merely explains the paths along which magic proceeds; it does not explain its true essence, namely the misunderstanding which leads it to replace the laws of nature by psychological ones. Some dynamic factor is evidently missing. But whereas the critics of Frazer's theory have gone astray in their search for it, it will be easy to arrive at a satisfactory explanation of magic merely by carrying the associative theory further and deeper.

Let us consider first the simpler and more important case of imitative magic. According to Frazer (1911a, 1, 54) it can be practised by itself, whereas contagious magic as a rule presupposes the other. It is easy to perceive the motives which lead men to practise magic: they are human wishes. All we need to suppose is that primitive man had an immense belief in the power of his wishes. The basic reason why what he sets about by magical means comes to pass is, after all, simply that he wills it. To begin with, therefore, the emphasis is only upon his wish.

Children are in an analogous psychical situation, though their motor efficiency is still undeveloped. I have elsewhere (1911*b*) put forward the hypothesis that, to begin with, they satisfy their wishes in a hallucinatory manner, that is, they create a satisfying situation by means of centrifugal excitations of their sense organs. An adult primitive man has an alternative method open to him. His wishes are accompanied by a motor impulse, the will, which is later destined to alter the whole face of the earth in order to satisfy his wishes. This motor impulse is at first employed to give a representation of the satisfying situation in such a way that it becomes possible to experience the satisfaction by means of what might be described as motor hallucinations. This kind of representation of a satisfied wish is quite comparable to children's play, which succeeds their earlier purely sensory technique of satisfaction. If children and primitive men find play and imitative representation enough for them, that is not a sign of their being unassuming in our sense or of their resignedly accepting their actual impotence. It is the easily understandable result of the paramount virtue they ascribe to their wishes, of the will that is associated with those wishes and of the methods by which those wishes operate. As time goes on, the psychological accent shifts from the *motives* for the magical act on to the *measures* by which it is carried out - that is, on to the act itself. (It would perhaps be more correct to say that it is only these measures that reveal to the subject the excessive valuation which he attaches to his psychical acts.) It thus comes to appear as though it is the magical act itself which, owing to its similarity with the desired result, alone determines the occurrence of that result. There is no opportunity, at the stage of animistic thinking, for showing any objective evidence of the true state of affairs. But a possibility of doing so *does* arrive at a later time, when, though all of these procedures are still being carried out, the psychical phenomenon of doubt has begun to emerge as an expression of a tendency to repression. At that point, men will be ready to admit that conjuring up spirits has no result unless it is accompanied by faith, and that the magical power of prayer fails if there is no piety at work behind it.¹

¹ Cf. the King in *Hamlet* (III. 3):

My words fly up, my thoughts remain below:
Words without thoughts never to heaven go.

The fact that it has been possible to construct a system of contagious magic on associations of contiguity shows that the importance attached to wishes and to the will has been extended from them on to all those psychical acts which are subject to the will. A general overvaluation has thus come about of all mental processes - an attitude towards the world, that is, which, in view of our knowledge of the relation between reality and thought, cannot fail to strike *us* as an overvaluation of the latter. Things become less important than ideas of things: whatever is done to the latter will inevitably also occur to the former. Relations which hold between the ideas of things are assumed to hold equally between the things themselves. Since distance is of no importance in thinking - since what lies furthest apart both in time and space can without difficulty be comprehended in a single act of consciousness - so, too, the world of magic has a telepathic disregard for spatial distance and treats past situations as though they were present. In the animistic epoch the reflection of the internal world is bound to blot out the other picture of the world - the one which *we* seem to perceive.

It is further to be noticed that the two principles of association - similarity and contiguity - are both included in the more comprehensive concept of 'contact'. Association by contiguity is contact in the literal sense; association by similarity is contact in the metaphorical sense. The use of the same word for the two kinds of relation is no doubt accounted for by some identity in the psychical processes concerned which we have not yet grasped. We have here the same range of meaning of the idea of 'contact' as we found in our analysis of taboo. (Cf. p. 2675.)

By way of summary, then, it may be said that the principle governing magic, the technique of the animistic mode of thinking, is the principle of the 'omnipotence of thoughts'.

(3)

I have adopted the term 'omnipotence of thoughts' from a highly intelligent man who suffered from obsessional ideas and who, after having been set right by psycho-analytic treatment, was able to give evidence of his efficiency and good sense. (Cf. Freud, 1909*d*.) He had coined the phrase as an explanation of all the strange and uncanny events by which he, like others afflicted with the same illness, seemed to be pursued. If he thought of someone, he would be sure to meet that very person immediately afterwards, as though by magic. If he suddenly asked after the health of an acquaintance whom he had not seen for a long time, he would hear that he had just died, so that it would look as though a telepathic message had arrived from him. If, without any really serious intention, he swore at some stranger, he might be sure that the man would die soon afterwards, so that he would feel responsible for his death. In the course of the treatment he himself was able to tell me how the deceptive appearance arose in most of these cases, and by what contrivances he himself had helped to strengthen his own superstitious beliefs. All obsessional neurotics are superstitious in this way, usually against their better judgement.¹

¹ We appear to attribute an 'uncanny' quality to impressions that seek to confirm the omnipotence of thoughts and the animistic mode of thinking in general, after we have reached a stage at which, in our *judgement*, we have abandoned such beliefs.

It is in obsessional neuroses that the survival of the omnipotence of thoughts is most clearly visible and that the consequences of this primitive mode of thinking come closest to consciousness. But we must not be misled into supposing that it is a distinguishing feature of this particular neurosis, for analytic investigation reveals the same thing in the other neuroses as well. In all of them what determines the formation of symptoms is the reality not of experience but of thought. Neurotics live in a world apart, where, as I have said elsewhere, only 'neurotic currency' is legal tender; that is to say, they are only affected by what is thought with intensity and pictured with emotion, whereas agreement with external reality is a matter of no importance. What hysterics repeat in their attacks and fix by means of their symptoms are experiences which have occurred in that form only in their imagination though it is true that in the last resort those imagined experiences go back to actual events or are based upon them. To attribute the neurotic sense of guilt to real misdeeds would show an equal misunderstanding. An obsessional neurotic may be weighed down by a sense of guilt that would be appropriate in a mass-murderer, while in fact, from his childhood onwards, he has behaved to his fellow-men as the most considerate and scrupulous member of society. Nevertheless, his sense of guilt has a justification: it is founded on the intense and frequent death wishes against his fellows which are unconsciously at work in him. It has a justification if what we take into account are unconscious thoughts and not intentional deeds. Thus the omnipotence of thoughts, the overvaluation of mental processes as compared with reality, is seen to have unrestricted play in the emotional life of neurotic patients and in everything that derives from it. If one of them undergoes psycho-analytic treatment, which makes what is unconscious in him conscious, he will be unable to believe that thoughts are free and will constantly be afraid of expressing evil wishes, as though their expression would lead inevitably to their fulfilment. This behaviour, as well as the superstitions which he practises in ordinary life, reveals his resemblance to the savages who believe they can alter the external world by mere thinking.

The primary obsessive acts of these neurotics are of an entirely magical character. If they are not charms, they are at all events counter-charms, designed to ward off the expectations of disaster with which the neurosis usually starts. Whenever I have succeeded in penetrating the mystery, I have found that the expected disaster was death. Schopenhauer has said that the problem of death stands at the outset of every philosophy; and we have already seen that the origin of the belief in souls and in demons, which is the essence of animism, goes back to the impression which is made upon men by death. It is difficult to judge whether the obsessive or protective acts performed by obsessional neurotics follow the law of similarity (or, as the case may be, of contrast); for as a rule, owing to the prevailing conditions of the neurosis, they have been distorted by being displaced on to something very small, some action in itself of the greatest triviality.¹ The protective formulas of obsessional neuroses, too, have their counterpart in the formulas of magic. It is possible, however, to describe the course of development of obsessive acts: we can show how they begin by being as remote as possible from anything sexual - magical defences against evil wishes - and how they end by being substitutes for the forbidden sexual act and the closest possible imitations of it.

¹ A further motive for such displacement on to a very small action will appear in what follows.

If we are prepared to accept the account given above of the evolution of human views of the universe - an animistic phase followed by a religious phase and this in turn by a scientific one - it will not be difficult to follow the vicissitudes of the 'omnipotence of thoughts' through these different phases. At the animistic stage men ascribe omnipotence to *themselves*. At the religious stage they transfer it to the gods but do not seriously abandon it themselves, for they reserve the power of influencing the gods in a variety of ways according to their wishes. The scientific view of the universe no longer affords any room for human omnipotence; men have acknowledged their smallness and submitted resignedly to death and to the other necessities of nature. None the less some of the primitive belief in omnipotence still survives in men's faith in the power of the human mind, which grapples with the laws of reality.

If we trace back the development of libidinal trends as we find them in the individual from their adult forms to the first beginnings in childhood, an important distinction emerges, which I have described in my *Three Essays on the Theory of Sexuality* (1905d). Manifestations of the sexual instincts can be observed from the very first, but to begin with they are not yet directed towards any external object. The separate instinctual components of sexuality work independently of one another to obtain pleasure and find satisfaction in the subject's own body. This stage is known as that of auto-erotism and it is succeeded by one in which an object is chosen.

Further study has shown that it is expedient and indeed indispensable to insert a third stage between these two, or, putting it in another way, to divide the first stage, that of auto-erotism, into two. At this intermediate stage, the importance of which is being made more and more evident by research, the hitherto isolated sexual instincts have already come together into a single whole and have also found an object. But this object is not an external one, extraneous to the subject, but it is his own ego, which has been constituted at about this same time. Bearing in mind pathological fixations of this new stage, which become observable later, we have given it the name of 'narcissism'. The subject behaves as though he were in love with himself; his egoistic instincts and his libidinal wishes are not yet separable under our analysis.

Although we are not yet in a position to describe with sufficient accuracy the characteristics of this narcissistic stage, at which the hitherto dissociated sexual instincts come together into a single unity and cathect the ego as an object, we suspect already that this narcissistic organization is never wholly abandoned. A human being remains to some extent narcissistic even after he has found external objects for his libido. The cathexes of objects which he effects are as it were emanations of the libido that still remains in his ego and can be drawn back into it once more. The state of being in love, which is psychologically so remarkable and is the normal prototype of the psychoses, shows these emanations at their maximum compared to the level of self-love.

Primitive men and neurotics, as we have seen, attach a high valuation - in our eyes an *over-valuation* - to psychical acts. This attitude may plausibly be brought into relation with narcissism and regarded as an essential component of it. It may be said that in primitive men the process of thinking is still to a great extent sexualized. This is the origin of their belief in the omnipotence of thoughts, their unshakable confidence in the possibility of controlling the world and their inaccessibility to the experiences, so easily obtainable, which could teach them man's true position in the universe. As regards neurotics, we find that on the one hand a considerable part of this primitive attitude has survived in their constitution, and on the other hand that the sexual repression that has occurred in them has brought about a further sexualization of their thinking processes. The psychological results must be the same in both cases, whether the libidinal hypercathexis of thinking is an original one or has been produced by regression: intellectual narcissism and the omnipotence of thoughts.¹

¹ 'It is almost an axiom with writers on this subject, that a sort of Solipsism, or Berkleianism (as Professor Sully terms it as he finds it in the Child), operates in the savage to make him refuse to recognize death as a fact.' (Marett, 1900, 178.)

If we may regard the existence among primitive races of the omnipotence of thoughts as evidence in favour of narcissism, we are encouraged to attempt a comparison between the phases in the development of men's view of the universe and the stages of an individual's libidinal development. The animistic phase would correspond to narcissism both chronologically and in its content; the religious phase would correspond to the stage of object-choice of which the characteristic is a child's attachment to his parents; while the scientific phase would have an exact counterpart in the stage at which an individual has reached maturity, has renounced the pleasure principle, adjusted himself to reality and turned to the external world for the object of his desires.¹

In only a single field of our civilization has the omnipotence of thoughts been retained, and that is in the field of art. Only in art does it still happen that a man who is consumed by desires performs something resembling the accomplishment of those desires and that what he does in play produces emotional effects - thanks to artistic illusion - just as though it were something real. People speak with justice of the 'magic of art' and compare artists to magicians. But the comparison is perhaps more significant than it claims to be. There can be no doubt that art did not begin as art for art's sake. It worked originally in the service of impulses which are for the most part extinct to-day. And among them we may suspect the presence of many magical purposes.²

¹ I will only briefly allude here to the fact that the original narcissism of children has a decisive influence upon our view of the development of their character and excludes the possibility of their having any primary sense of inferiority.

² Cf. Reinach, 'L'art et la magie' (1905-12, 1, 125-36). In Reinach's opinion the primitive artists who left behind the carvings and paintings of animals in the French caves, did not desire to 'please' but to 'evoke' or conjure up. He thus explains why it is that these pictures are situated in the darkest and most inaccessible parts of the caves and that dangerous beasts of prey do not appear among them. 'Les modernes parlent souvent, par hyperbole, de la magie du pinceau ou du ciseau d'un grand artiste et, en général, de la magie de l'art. Entendu au sens propre, qui est celui d'une contrainte mystique exercée par la volonté de l'homme sur d'autres volontés ou sur les choses, cette expression n'est plus admissible; mais nous avons vu qu'elle était autrefois rigoureusement vraie, du moins dans l'opinion des artistes.' (Ibid., 136.) ['In modern times people often speak metaphorically of the magic of a great artist's brush or chisel, or more generally of the magic of art. This expression is no longer permissible in its proper sense of a mystical force brought to bear by the human will upon other wills or upon objects; but, as we have seen, there was a time when it was literally true - at least in the artists' opinion.']

(4)

Thus the first picture which man formed of the world - animism - was a psychological one. It needed no scientific basis as yet, since science only begins after it has been realized that the world is unknown and that means must therefore be sought for getting to know it. Animism came to primitive man naturally and as a matter of course. He knew what things were like in the world, namely just as he felt himself to be. We are thus prepared to find that primitive man transposed the structural conditions of his own mind¹ into the external world; and we may attempt to reverse the process and put back into the human mind what animism teaches as to the nature of things.

The technique of animism, magic, reveals in the clearest and most unmistakable way an intention to impose the laws governing mental life upon real things; in this, spirits need not as yet play any part, though spirits may be taken as objects of magical treatment. Thus the assumptions of magic are more fundamental and older than the doctrine of spirits, which forms the kernel of animism. Our psycho-analytic point of view coincides here with a theory put forward by R. R. Marett (1900), who postulates a pre-animistic stage before animism, the character of which is best indicated by the term 'animatism', the doctrine of the universality of life. Experience has little light to throw on pre-animism, since no race has yet been discovered which is without the concept of spirits. (Cf. Wundt, 1906, 171 ff.)

Whereas magic still reserves omnipotence solely for thoughts, animism hands some of it over to spirits and so prepares the way for the construction of a religion. What, we may ask, can have induced a primitive man to make this first act of renunciation? It can scarcely have been a recognition of the falseness of his premises, for he continued to practise the magical technique.

¹ Which he was aware of by what is known as endopsychic perception.

Spirits and demons, as I have shown in the last essay, are only projections of man's own emotional impulses.¹ He turns his emotional cathexes into persons, he peoples the world with them and meets his internal mental processes again outside himself - in just the same way as that intelligent paranoid, Schreber, found a reflection of the attachments and detachments of his libido in the vicissitudes of his confabulated 'rays of God'.²

I propose to avoid (as I have already done elsewhere³) entering into the general problem of the origin of the tendency to project mental processes into the outside. It is, however, safe to assume that that tendency will be intensified when projection promises to bring with it the advantage of mental relief. Such an advantage may be expected with certainty where a conflict has arisen between different impulses all of which are striving towards omnipotence - for they clearly cannot *all* become omnipotent. The pathological process in paranoia in fact makes use of the mechanism of projection in order to deal with mental conflicts of this kind. The typical case of such a conflict is one between the two members of a pair of opposites - the case of an ambivalent attitude, which we have examined in detail as it appears in someone mourning the death of a loved relative. This kind of case must seem particularly likely to provide a motive for the creation of projections. Here again we are in agreement with the writers who maintain that the first born spirits were evil spirits, and who derive the idea of a soul from the impression made by death upon the survivors. The only difference is that we do not lay stress on the *intellectual* problem with which death confronts the living; in our view the force which gives the impetus to research is rather to be attributed to the *emotional* conflict into which the survivors are plunged.

Thus man's first theoretical achievement - the creation of spirits - seems to have arisen from the same source as the first moral restrictions to which he was subjected - the observances of taboo. The fact that they had the same origin need not imply, however, that they arose simultaneously. If the survivors' position in relation to the dead was really what first caused primitive man to reflect, and compelled him to hand over some of his omnipotence to the spirits and to sacrifice some of his freedom of action, then these cultural products would constitute a first acknowledgement of *'Ανάγκη* [Necessity], which opposes human narcissism. Primitive man would thus be submitting to the supremacy of death with the same gesture with which he seemed to be denying it.

¹ I assume that at this early narcissistic stage cathexes arising from libidinal and from other sources of excitation may still be indistinguishable from one another.

² Cf. Schreber (1903) and Freud (1911c).

³ In my paper on Schreber (Freud, 1911c).

If we may venture to exploit our hypothesis still further, we may inquire which essential part of our psychological structure is reflected and reproduced in the projective creation of souls and spirits. It could scarcely be disputed that the primitive conception of a soul, however much it may differ from the later, purely immaterial soul, is nevertheless intrinsically the same; that is to say, it assumes that both persons and things are of a double nature and that their known attributes and modifications are distributed between their two component portions. This original 'duality', to borrow an expression from Herbert Spencer (1893), is identical with the dualism proclaimed by our current distinction between soul and body and by such ineradicable linguistic expressions of it as the use of phrases like 'beside himself' or 'coming to himself' in relation to fits of rage or fainting (*ibid.*, 144).

When we, no less than primitive man, project something into external reality, what is happening must surely be this: we are recognizing the existence of two states - one in which something is directly given to the senses and to consciousness (that is, is *present* to them), and alongside it another, in which the same thing is *latent* but capable of re-appearing. In short, we are recognizing the co-existence of perception and memory, or, putting it more generally, the existence of *unconscious* mental processes alongside the *conscious* ones.¹ It might be said that in the last analysis the 'spirit' of persons or things comes down to their capacity to be remembered and imagined after perception of them has ceased.

It is not, of course, to be expected that either the primitive or the present-day concept of a 'soul' will be separated from that of the other portion of the personality by the same line of demarcation which our modern science draws between conscious and unconscious mental activity. The animistic soul unites properties from both sides. Its volatile and mobile quality, its power of leaving the body and of taking possession, temporarily or permanently, of another body - these are characteristics which remind us unmistakably of the nature of consciousness. But the way in which it remains concealed behind the manifest personality is reminiscent of the unconscious; immutability and indestructibility are qualities which we no longer attribute to conscious but rather to unconscious processes, and we regard the latter as the true vehicle of mental activity.

¹ Cf. my short paper on the use of the concept 'unconscious' in psycho-analysis, first published in the *Proceedings of the Society for Psychical Research* in 1912.

I have said that animism is a system of thought, the first complete theory of the universe, and I shall now go on to draw certain conclusions from the psycho-analytic view of such systems. Every day of our lives our experience is in a position to show us the principal characteristics of a 'system'. We have dreams during the night and we have learnt how to interpret them during the day. Dreams may, without contradicting their nature, appear confused and disconnected. But they may, on the contrary, simulate the orderly impressions of a real experience, they may make one event follow from another and make one portion of their content refer to another. Such a result can be more or less successfully achieved; but it scarcely ever succeeds so completely as to leave no absurdity, no rift in its texture, visible. When we come to submit a dream to interpretation, we find that the erratic and irregular arrangement of its constituent parts is quite unimportant from the point of view of our understanding it. The essential elements in a dream are the dream-thoughts, and these have meaning, connection and order. But their order is quite other than that remembered by us as present in the manifest dream. In the latter the connection between the dream-thoughts has been abandoned and may either remain completely lost or be replaced by the new connection exhibited in the manifest content. The elements of the dream, apart from their being condensed, are almost invariably arranged in a new order more or less independent of their earlier arrangement. Finally, it must be added that whatever the original material of the dream-thoughts has been turned into by the dream-work is then subjected to a further influence. This is what is known as 'secondary revision', and its purpose is evidently to get rid of the disconnectedness and unintelligibility produced by the dream-work and replace it by a new 'meaning'. But this new meaning, arrived at by secondary revision, is no longer the meaning of the dream-thoughts.

The secondary revision of the product of the dream-work is an admirable example of the nature and pretensions of a system. There is an intellectual function in us which demands unity, connection and intelligibility from any material, whether of perception or thought, that comes within its grasp; and if, as a result of special circumstances, it is unable to establish a true connection, it does not hesitate to fabricate a false one. Systems constructed in this way are known to us not only from dreams, but also from phobias, from obsessive thinking and from delusions. The construction of systems is seen most strikingly in delusional disorders (in paranoia), where it dominates the symptomatic picture; but its occurrence in other forms of neuro-psychosis must not be overlooked. In all these cases it can be shown that a rearrangement of the psychical material has been made with a fresh aim in view; and the rearrangement may often have to be a drastic one if the outcome is to be made to appear intelligible from the point of view of the system. Thus a system is best characterized by the fact that at least two reasons can be discovered for each of its products: a reason based upon the premises of the system (a reason, then, which may be delusional) and a concealed reason, which we must judge to be the truly operative and the real one.

This may be illustrated by an example from a neurosis. In my essay on taboo I mentioned a woman patient of mine whose obsessional prohibitions showed the most perfect agreement with a Maori taboo (p. 2676). This woman's neurosis was aimed at her husband and culminated in her defence against an unconscious wish that he should die. Her manifest, systematic phobia, however, related to the mention of death in general, while her husband was entirely excluded from it and was never an object of her conscious solicitude. One day she heard her husband giving instructions that his razors, which had lost their edge, were to be taken to a particular shop to be re-set. Driven by a strange uneasiness, she herself set off for the shop. After reconnoitring the ground, she came back and insisted that her husband should get rid of the razors for good and all, since she had discovered that next door to the shop he had named there was an undertaker's establishment: owing to the plan he had made, she said, the razors had become inextricably involved with thoughts of death. This, then, was the *systematic* reason for her prohibition. We may be quite sure that, even without her discovery of the next-door shop, the patient would have come home with a prohibition against the razors. It would have been enough if she had met a hearse on her way to the shop, or someone dressed in mourning or carrying a funeral wreath. The net of possible determinants for the prohibition was spread wide enough to catch the quarry in any event; it merely depended on her decision whether to draw it together or not. It could be shown that on other occasions she would not put the determinants into operation, and she would explain this by saying it had been 'a better day'. The *real* cause of her prohibition upon the razors was, of course, as it was easy to discover, her repugnance to attaching any pleasurable feeling to the idea that her husband might cut his throat with the newly ground razors.

In just the same way, an inhibition upon movement (an abasia or an agoraphobia) will gradually become more complete and more detailed, when once that system has succeeded in installing itself as a representative of an unconscious wish and of the defence against the wish. Whatever other unconscious phantasies and operative reminiscences may be present in the patient force their way to expression as symptoms along this same path, once it has been opened, and group themselves into an appropriate new arrangement within the framework of the inhibition upon movement. Thus it would be a vain and indeed a foolish task to attempt to understand the complexities and details of the symptoms of (for example) an agoraphobia on the basis of its underlying premises; for the whole consistency and strictness of the combination are merely *apparent*. Just as with the façades of dreams, if we look more attentively we find the most blatant inconsistency and arbitrariness in the structure of symptoms. The real reason for the details of a systematic phobia of this kind lies in concealed determinants, which need have nothing to do with an inhibition upon movement; and that, too, is why these phobias take such various and contradictory shapes in different people.

Let us now return to the animistic system with which we are dealing. The insight we have gained into *other* psychological systems enables us to conclude that with primitive man, too, 'superstition' need not be the only or the real reason for some particular custom or observance and does not excuse us from the duty of searching for its hidden motives. Under the domination of an animistic system it is inevitable that every observance and every activity shall have a systematic basis, which nowadays we describe as 'superstitious'. 'Superstition' - like 'anxiety', 'dreams' and 'demons' - is one of those provisional psychological concepts which have crumbled under the impact of psycho-analytic research. Once we have penetrated behind these constructions, which are like screens erected as defences against correct understanding, we begin to realize that the mental life and cultural level of savages have not hitherto had all the recognition they deserve.

If we take instinctual repression as a measure of the level of civilization that has been reached, we shall have to admit that even under the animistic system advances and developments took place which are unjustly despised on account of their superstitious basis. When we are told that the warriors in a savage tribe practise the greatest continence and cleanliness when they go on the war-path, the explanation is put forward that their motive is 'a fear lest the enemy should obtain the refuse of their persons, and thus be enabled to work their destruction by magic' (Frazer, 1911*b*, 157); and an analogous superstitious reason could be suggested for their continence. None the less the fact remains that they have made an instinctual renunciation; and we can understand the position better if we suppose that the savage warrior submits to these restrictions as a counter-measure because he is on the point of yielding completely to the satisfaction of cruel and hostile impulses which are as a rule prohibited to him. The same is true of the numerous cases of sexual restrictions being imposed on anyone who is engaged on difficult or responsible work (ibid., 200 f.). Though the grounds alleged for these prohibitions may belong to a magical context, yet the fundamental idea of gaining greater strength by renouncing some instinctual satisfaction remains unmistakable; and the hygienic root of the prohibition which lies alongside its magical rationalization must not be overlooked. When the men of a savage tribe go out on an expedition to hunt, to fish, to fight or to gather precious plants, their wives left at home are subjected to many oppressive restrictions, to which the savages themselves ascribe a favourable influence, operating at a distance upon the success of the expedition. But it requires very little penetration to see that this factor which operates at a distance is nothing other than the absent men's longing thoughts of home, and that behind these disguises lies a sound piece of psychological insight that the men will only do their best if they feel completely secure about the women whom they have left behind them unguarded. Sometimes they will even themselves declare, without alleging any magical reasons, that a wife's infidelity in marriage will bring to nothing the efforts of an absent husband engaged on some responsible work.

The countless taboo regulations to which the women in savage communities are subject during menstruation are said to be due to a superstitious horror of blood, and this is no doubt in fact one of their determinants. But it would be wrong to overlook the possibility that in this case the horror of blood also serves aesthetic and hygienic purposes, which are obliged in every case to cloak themselves behind magical motives.

I am under no illusion that in putting forward these attempted explanations I am laying myself open to the charge of endowing modern savages with a subtlety in their mental activities which exceeds all probability. It seems to me quite possible, however, that the same may be true of our attitude towards the psychology of those races that have remained at the animistic level as is true of our attitude towards the mental life of children, which we adults no longer understand and whose fullness and delicacy of feeling we have in consequence so greatly underestimated.

One further group of taboo observances, which have not hitherto been accounted for, deserve mention, since they admit of an explanation which is familiar to psycho-analysts. Among many savage peoples there is a prohibition against keeping sharp weapons or cutting instruments in a house. Frazer (1911*b*, 238) quotes a German superstition to the effect that a knife should not be left edge upwards, for fear that God and the angels might be injured on it. May we not recognize in this taboo a premonitory warning against possible 'symptomatic acts' in the execution of which a sharp weapon might be employed by unconscious evil impulses?

IV

THE RETURN OF TOTEMISM IN CHILDHOOD

There are no grounds for fearing that psycho-analysis, which first discovered that psychical acts and structures are invariably overdetermined, will be tempted to trace the origin of anything so complicated as religion to a single source. If psycho-analysis is compelled - and is, indeed, in duty bound - to lay all the emphasis upon one particular source, that does not mean it is claiming either that that source is the only one or that it occupies first place among the numerous contributory factors. Only when we can synthesize the findings in the different fields of research will it become possible to arrive at the relative importance of the part played in the genesis of religion by the mechanism discussed in these pages. Such a task lies beyond the means as well as beyond the purposes of a psycho-analyst.

(1)

In the first of this series of essays we became acquainted with the concept of totemism. We heard that totemism is a system which takes the place of a religion among certain primitive peoples of Australia, America and Africa, and provides the basis of their social organization. As we have heard, it was a Scotsman, McLennan, who in 1869 first drew general attention to the phenomena of totemism (which had hitherto been regarded as mere curiosities) by giving voice to a suspicion that a large number of customs and usages current in various societies ancient and modern were to be explained as remnants of a totemic age. Since that date science has fully accepted his estimate of totemism. Let me quote, as one of the most recent statements on the subject, a passage from Wundt's *Elemente der Völkerpsychologie* (1912, 139): 'In the light of all these facts, the conclusion appears highly probable that at some time totemic culture everywhere paved the way for a more advanced civilization, and, thus, that it represents a transitional stage between the age of primitive men and the era of heroes and gods.'

The purpose of the present essays obliges us to enter more deeply into the nature of totemism. For reasons which will presently become clear I will begin with an account given by Reinach, who, in 1900,¹ sketched out a '*Code du totémisme*' in twelve Articles - a catechism, as it were, of the totemic religion:

(1) Certain animals may neither be killed nor eaten, but individual members of the species are reared by human beings and cared for by them.

(2) An animal which has died an accidental death is mourned over and buried with the same honours as a member of the clan.

(3) In some instances the eating prohibition extends only to one particular part of the animal's body.

(4) When one of the animals which are usually spared has to be killed under the stress of necessity, apologies are offered to it and an attempt is made by means of various artifices and evasions to mitigate the violation of the taboo - that is to say, the murder.

(5) When the animal is made the victim of a ritual sacrifice, it is solemnly bewailed.

(6) On particular solemn occasions and at religious ceremonies the skins of certain animals are worn.

Where totemism is still in force, they are the totem animals.

(7) Clans and individuals adopt the names of animals - viz. of the totem animals.

(8) Many clans make use of representations of animals on their standards and weapons; the men have pictures of animals painted or tattooed on their bodies.

(9) If the totem is a formidable or dangerous animal, it is supposed to spare members of the clan named after it.

(10) The totem animal protects and gives warning to members of its clan.

(11) The totem animal foretells the future to the loyal members of its clan and serves them as guide.

(12) The members of the totemic clan often believe that they are related to the totem animal by the bond of a common ancestry.

This catechism of the totemic religion can only be seen at its proper value if we take into account the fact that Reinach has included in it all the indications and traces from which the earlier existence of a totemic system can be inferred. The author's peculiar attitude to the problem is shown by his partial neglect of the essential features of totemism. As we shall see, he has relegated one of the two principal articles of the totemic catechism to the background and entirely overlooked the other.

¹ Cf. Reinach (1905-12, 1, 17 ff.).

To obtain a correct picture of the nature of totemism we must turn to another author, who has devoted a four-volume work to the subject, which combines the fullest collection of the relevant observations with the most detailed discussion of the problems they raise. We shall remain indebted to J. G. Frazer, the author of *Totemism and Exogamy* (1910), both for enjoyment and instruction, even if psycho-analytic research may lead to conclusions which differ widely from his.¹

¹ It may be as well, however, to warn the reader, in advance, of the difficulties with which any statements on the subject have to contend.

In the first place, those who collect the observations are not the same as those who examine and discuss them. The former are travellers and missionaries while the latter are students who may never have set eyes on the objects of their researches. Again, communication with savages is not an easy matter. The observers are not always acquainted with the native language but may be obliged to rely on the help of interpreters or to conduct their inquiries through the medium of pidgin-English. Savages are not communicative on the subject of the most intimate details of their cultural life and they talk openly only to those foreigners who have lived among them for many years. They often give false or misleading information for a great variety of motives. (Cf. Frazer, 1910, 1, 150 f.) It should not be forgotten that primitive races are not young races but are in fact as old as civilized races. There is no reason to suppose that, for the benefit of our information, they have retained their original ideas and institutions undeveloped and undistorted. On the contrary, it is certain that there have been profound changes in every direction among primitive races, so that it is never possible to decide without hesitation how far their present-day conditions and opinions preserve the *primaeval* past in a petrified form and how far they are distortions and modifications of it. Hence arise the all-too-frequent disputes among the authorities as to which characteristics of a primitive civilization are to be regarded as primary and as to which are later and secondary developments. The determination of the original state of things thus invariably remains a matter of construction. Finally, it is not easy to feel one's way into primitive modes of thinking. We misunderstand primitive men just as easily as we do children, and we are always apt to interpret their actions and feelings according to our own mental constellations.

'A totem', wrote Frazer in his first essay on the subject,¹ 'is a class of material objects which a savage regards with superstitious respect, believing that there exists between him and every member of the class an intimate and altogether special relation . . . The connection between a man and his totem is mutually beneficent; the totem protects the man, and the man shows his respect for the totem in various ways, by not killing it if it be an animal, and not cutting or gathering it if it be a plant. As distinguished from a fetish, a totem is never an isolated individual, but always a class of objects, generally a species of animals or of plants, more rarely a class of inanimate natural objects, very rarely a class of artificial objects. . . .

'Totems are of at least three kinds: (1) the clan totem, common to a whole clan, and passing by inheritance from generation to generation; (2) the sex totem, common either to all the males or to all the females of a tribe, to the exclusion in either case of the other sex; (3) the individual totem, belonging to a single individual and not passing to his descendants. . . .'

The last two kinds of totem do not compare in significance with the clan totem. Unless we are quite mistaken, they are late developments and of little importance for the essential nature of the totem.

'The clan totem is revered by a body of men and women who call themselves by the name of the totem, believe themselves to be of one blood, descendants of a common ancestor, and are bound together by common obligations to each other and by a common faith in the totem. Totemism is thus both a religious and a social system. In its religious aspect it consists of the relations of mutual respect and protection between a man and his totem; in its social aspect it consists of the relations of the clansmen to each other and to men of other clans. In the later history of totemism these two sides, the religious and the social, tend to part company; the social system sometimes survives the religious; and, on the other hand, religion sometimes bears traces of totemism in countries where the social system based on totemism has disappeared. How in the origin of totemism these two sides were related to each other it is, in our ignorance of that origin, impossible to say with certainty. But on the whole the evidence points strongly to the conclusion that the two sides were originally inseparable; that, in other words, the farther we go back, the more we should find that the clansman regards himself and his totem as beings of the same species, and the less he distinguishes between conduct towards his totem and towards his fellow-clansmen.'

¹ *Totemism*, Edinburgh, 1887, reprinted in Frazer (1910, 1, 3 ff.).

In giving particulars of totemism as a religious system, Frazer begins by stating that the members of a totem clan call themselves by the name of their totem, and *commonly believe themselves to be actually descended from it*. It follows from this belief that they will not hunt the totem animal or kill or eat it and, if it is something other than an animal, they refrain from making use of it in other ways. The rules against killing or eating the totem are not the only taboos; sometimes they are forbidden to touch it, or even to look at it; in a number of cases the totem may not be spoken of by its proper name. Any violation of the taboos that protect the totem are automatically punished by severe illness or death.¹

Specimens of the totem animal are occasionally reared by the clan and cared for in captivity.² A totem animal that is found dead is mourned for and buried like a dead clansman. If it is necessary to kill a totem animal, this is done according to a prescribed ritual of apologies and ceremonies of expiation.

The clan expects to receive protection and care from its totem. If it is a dangerous animal (such as a beast of prey or a venomous snake) there is a presumption that it will do no harm to its clansmen; and if that expectation is not fulfilled the injured man is expelled from the clan. Oaths, in Frazer's opinion, were originally ordeals; thus, many tests of descent and legitimacy were submitted for decision to the totem. The totem gives help in sickness and delivers omens and warnings to its clan. The appearance of the totem in or about a house is often regarded as an omen of death; the totem has come to fetch his kinsman.³

¹ Cf. my earlier essay on taboo.

² As is done to this day with the she-wolf in her cage beside the steps leading up to the Capitol in Rome and with the bears in their den at Berne.

³ Like the White Lady in certain aristocratic families.

In particular important circumstances the clansman seeks to emphasize his kinship with the totem by making himself resemble it externally, by dressing in the skin of the animal, by incising a picture of the totem upon his own body, and so on. This identification with the totem is carried into effect in actions and words on the ceremonial occasions of birth, initiation and burial. Various magical and religious purposes are served by dances in which all the clansmen disguise themselves as their totem and imitate its behaviour. Lastly, there are ceremonies in which the totem animal is ceremoniously killed.¹

The social aspect of totemism is principally expressed in a severely enforced injunction and a sweeping restriction.

The members of a totem clan are brothers and sisters and are bound to help and protect one another. If a member of a clan is killed by someone outside it, the whole clan of the aggressor is responsible for the deed and the whole clan of the murdered man is at one in demanding satisfaction for the blood that has been shed. The totem bond is stronger than that of the family in our sense. The two do not coincide, since the totem is as a rule inherited through the female line, and it is possible that paternal descent may originally have been left entirely out of account.

The corresponding taboo restriction prohibits members of the same totem clan from marrying or having sexual intercourse with each other. Here we have the notorious and mysterious correlate of totemism - exogamy. I have devoted the whole of the first essay in the present work to that subject, so that here I need only repeat that it originates from the intensification among savages of the horror of incest, that it would be fully explained as an assurance against incest under conditions of group marriage, and that it is primarily aimed at restraining the *younger* generation from incest and that only as a later development does it interfere with the older generation.

¹ Frazer (1910, 1, 45). See my discussion of sacrifice below.

To Frazer's account of totemism - one of the earliest in the literature of the subject - I will add a few extracts from one of the most recent ones. In his *Elemente der Völkerpsychologie*, Wundt (1912, 116 ff.) writes as follows: 'The totem animal is also usually regarded as the ancestral animal of the group in question. "Totem" is, on the one hand a group name, and, on the other, a name indicative of ancestry. In the latter connection it has also a mythological significance. These various ideas, however, interplay in numerous ways. Some of the meanings may recede, so that totems have frequently become a mere nomenclature of tribal divisions, while at other times the idea of ancestry, or, perhaps also, the cult significance, predominates. . . .' The concept of the totem has a decisive influence upon tribal division and tribal organization, which are subject to certain norms of custom. 'These norms, and their fixed place in the beliefs and feelings of the tribal members, are connected with the fact that originally, at all events, the totem animal was regarded, for the most part, as having not merely given its name to a group of tribal members but as having actually been its fore father. . . . Bound up with this is the further fact that these animal ancestors possessed a cult. . . . Aside from specific ceremonies and ceremonial festivals, this animal cult originally found expression primarily in the relations maintained towards the totem animal. It was not merely a particular animal that was to a certain extent held sacred, but every representative of the species. The totem members were forbidden to eat the flesh of the totem animal, or were allowed to do so only under specific conditions. A significant counter-phenomenon, not irreconcilable with this, is the fact that on certain occasions the eating of the totem flesh constituted a sort of ceremony. . . .'

'. . . The most important social aspect of this totemic tribal organization, however, consists in the fact that it involved certain norms of custom regulating the intercourse of the separate groups with one another. Of these norms, those governing marriage relations were of first importance. The tribal organization of this period was bound up with an important institution, *exogamy*, which originated in the totemic age.'

If we seek to penetrate to the original nature of totemism, without regard to subsequent accretions or attenuations, we find that its essential characteristics are these: *Originally, all totems were animals, and were regarded as the ancestors of the different clans. Totems were inherited only through the female line. There was a prohibition against killing the totem* (or - which, under primitive conditions, is the same thing - against eating it). *Members of a totem clan were forbidden to practise sexual intercourse with one another.*¹

We shall now, perhaps, be struck by the fact that in Reinach's *Code du totémisme* one of the two principal taboos, that of exogamy, is not mentioned at all, while the belief upon which the second one is founded, namely descent from the totem animal, is only referred to in passing. My reason, however, for selecting the account given by Reinach (a writer, incidentally, who has made very valuable contributions to the subject) was to prepare us for the differences of opinion between the authorities - differences into which we must now enter.

¹ The picture of totemism given by Frazer in his second work on it ('The Origin of Totemism', published in the *Fortnightly Review* in 1899) agrees with what I have written above: 'Thus, Totemism has commonly been treated as a primitive system both of religion and of society. As a system of religion it embraces the mystic union of the savage with his totem; as a system of society it comprises the relations in which men and women of the same totem stand to each other and to the members of other totemic groups. And corresponding to these two sides of the system are two rough and ready tests or canons of Totemism: first, the rule that a man may not kill or eat his totem animal or plant; and second, the rule that he may not marry or cohabit with a woman of the same totem.' Frazer then proceeds (thus plunging us into the middle of the controversies on totemism): 'Whether the two sides - the religious and the social - have always co-existed or are essentially independent, is a question which has been variously answered.'

(2)

The more incontestable became the conclusion that totemism constitutes a regular phase in all cultures, the more urgent became the need for arriving at an understanding of it and for throwing light upon the puzzle of its essential nature. Everything connected with totemism seems to be puzzling: the decisive problems concern the origin of the idea of descent from the totem and the reasons for exogamy (or rather for the taboo upon incest of which exogamy is the expression), as well as the relation between these two institutions, totemic organization and prohibition of incest. Any satisfactory explanation should be at once a historical and a psychological one. It should tell us under what conditions this peculiar institution developed and to what psychical needs in men it has given expression.

My readers will, I am sure, be astonished to hear of the variety of angles from which attempts have been made to answer these questions, and of the wide divergences of opinion upon them put forward by the experts. Almost any generalization that could be made on the subject of totemism and exogamy seems open to question. Even the account that I have just given, derived from the book published by Frazer in 1887, is open to the criticism that it expresses the present writer's arbitrary preferences; and indeed it would be contested to-day by Frazer himself, who has repeatedly changed his opinions on the subject.¹

¹ He makes the following admirable comment upon such changes of opinion: 'That my conclusions on these difficult questions are final, I am not so foolish as to pretend. I have changed my views repeatedly, and I am resolved to change them again with every change of the evidence, for like a chameleon the candid inquirer should shift his colours with the shifting colours of the ground he treads.' (Frazer, 1910, 1, xiii.)

It is plausible to suppose that an understanding of the essential nature of totemism and exogamy would best be arrived at, if it were possible to come nearer to the origins of the two institutions. But in this connection we must bear in mind Andrew Lang's warning that even primitive peoples have not retained the original forms of those institutions nor the conditions which gave rise to them; so that we have nothing whatever but hypotheses to fall back upon as a substitute for the observations which we are without.¹ Some of the attempted explanations seem, in the judgement of a psychologist, inadequate at the very outset: they are too rational and take no account of the emotional character of the matters to be explained. Others are based on assumptions which are unconfirmed by observation. Yet others rely upon material which would be better interpreted in another way. There is generally little difficulty in refuting the various views put forward: the authorities are as usual more effective in their criticisms of one another's work than in their own productions. The conclusion upon most of the points raised must be a *non liquet*. It is not surprising, therefore, that in the most recent literature on the subject (which is for the most part passed over in the present work) an unmistakable tendency emerges to reject any general solution of totemic problems as impracticable. (See, for instance, Goldenweiser, 1910.) In the discussion of these conflicting hypotheses which follows, I have ventured to disregard their chronological sequence.

(a) THE ORIGIN OF TOTEMISM

The question of the origin of totemism may be put in another way: how did it come about that primitive men called themselves (and their clans) after animals, plants and inanimate objects?²

McLennan (1865 and 1869-70), the Scot who discovered totemism and exogamy for the world of science, refrained from publishing any opinion on the origin of totemism. According to Andrew Lang (1905, 34) he was at one time inclined to think that it originated from the custom of tattooing. I propose to divide the published theories on the origin of totemism into three groups - (α) the nominalist, (β) the sociological and (γ) the psychological.

¹ 'By the nature of the case, as the origin of totemism lies far beyond our powers of historical examination or of experiment, we must have recourse as regards this matter to conjecture.' (Lang, 1905, 27.) 'Nowhere do we see absolutely *primitive* man, and a totemic system in the making.' (Ibid., 29.)

² In the first instance probably after animals only.

(α) Nominalist Theories

My accounts of these theories will justify my having brought them together under the title I have adopted.

Garcilasso de la Vega, a descendant of the Peruvian Incas, who wrote a history of his people in the seventeenth century, seems already to have attributed the origin of what he knew of totemic phenomena to the need felt by clans to distinguish themselves from one another by the use of names. (Lang, 1905, 34.) Hundreds of years later the same idea was again proposed. Keane¹ regards totems as 'heraldic badges' by means of which individuals, families and clans sought to distinguish themselves from one another. The same idea is expressed once more by Max-Müller (1897):² 'A totem is a clan mark, then a clan name, then the name of the ancestor of a clan, and lastly the name of something worshipped by a clan.' Julius Pikler,³ writing later, declares: 'Mankind required both for communities and for individuals a permanent name which could be fixed in writing. . . . Thus totemism did not arise from the religious needs of men but from their practical, everyday needs. The core of totemism, nomenclature, is a result of the primitive technique of writing. In its nature a totem is like an easily drawn pictograph. But when once savages bore the name of an animal, they went on to form the idea of kinship with it.'

In the same way, Herbert Spencer (1870 and 1893, 331-46) regards the giving of names as the decisive factor in the origin of totemism. The personal characteristics of particular individuals, he argues, prompted the idea of calling them after animals, and in that way they acquired laudatory names or nicknames which were handed on to their descendants. As a result of the vagueness and unintelligibility of primitive speech, later generations interpreted these names as evidence of descent from the actual animals. Totemism would thus be shown to be a misunderstood form of ancestor worship.

¹ Quoted by Lang.

² Quoted by Lang.

³ Pikler and Somló. These authors justly describe their attempted explanation of the origin of totemism as 'a contribution to the materialist theory of history'.

Lord Avebury (better known under his earlier name of Sir John Lubbock) gives a very similar account of the origin of totemism, though without insisting upon the element of misunderstanding. If, he says, we wish to explain animal-worship, we must not forget how often human names are borrowed from animals. The children and followers of a man who was called 'Bear' or 'Lion' naturally turned his name into a clan-name. Thence it came about that the animal itself would come to be regarded 'first with interest, then with respect and at length with a sort of awe'.

What would seem to be an incontrovertible objection to this derivation of totem names from the names of individuals was brought forward by Fison.¹ He showed from conditions in Australia that the totem is invariably 'the badge of a group, not of an individual'. But even if this were not so, and the totem was originally the name of an individual, it could never - since totems are inherited through the female line - be transmitted to his children.

Moreover, the theories which I have so far discussed are obviously inadequate. They might perhaps explain the fact that primitive peoples adopt animal names for their clans, but they could never explain the importance that has become attached to this nomenclature - namely, the totemic system. The theory belonging to this group which most deserves attention is that proposed by Andrew Lang (1903 and 1905). He, too, regards the giving of names as the heart of the problem, but he introduces two interesting psychological factors and may thus claim to have led the way towards the final solution of the enigma of totemism.

Andrew Lang regards it as initially a matter of indifference how clans obtained their animal names. It is only necessary to assume that they awoke one day to the consciousness that they bore such names and could give no account of how this had come about. *The origin of the names had been forgotten*. They would then attempt to arrive at an explanation by speculating on the subject; and, in view of their belief in the importance of names, they were bound to reach all the ideas contained in the totemic system. Primitive races (as well as modern savages and even our own children²) do not, like us, regard names as something indifferent and conventional, but as significant and essential. A man's name is a principal component of his personality, perhaps even a portion of his soul. The fact of a primitive man bearing the same name as an animal must lead him to assume the existence of a mysterious and significant bond between himself and that particular species of animal. What other bond could it be than one of blood relationship? Once the similarity of names had led to this conclusion, the blood taboo would immediately involve all the totemic ordinances, including exogamy. 'No more than these three things - a group animal name of unknown origin; belief in a transcendental connection between all bearers, human and bestial, of the same name; and belief in the blood superstitions - was needed to give rise to all the totemic creeds and practices, including exogamy.' (Lang, 1905, 125 f.)

¹ Fison and Howitt (1880, 165), quoted by Lang (1905).

² See the discussion of taboo above, p. 2699 ff.

Lang's explanation falls into two parts. One part of it traces the totemic system as a matter of psychological necessity from the fact of the totems having animal names - always presupposing that the origin of these names had been forgotten. The second part of his theory goes on to try to explain how the names in fact originated; as we shall see, it is of a very different character from the first part.

This second part of Lang's theory differs in no essential way from the other theories which I have called 'nominalist'. The practical necessity for differentiation compelled the various clans to adopt names, and they therefore acquiesced in the names by which each clan was called by another clan. This 'naming from without' is the special feature of Lang's construction. The fact that the names adopted in this way were borrowed from animals needs no special comment and there is no reason why they should have been regarded in primitive times as insulting or derisive. Moreover, Lang has adduced not a few instances from later historical times in which names that were originally given in derision by outsiders have been accepted and willingly adopted (e.g. '*Les Gueux*', 'Whigs' and 'Tories'). The hypothesis that in the course of time the origin of these names was forgotten connects this part of Lang's theory with the other part which I have already discussed.

(β) Sociological Theories

Reinach, who has been successful in tracing survivals of the totemic system in the cults and usages of later periods but who has always attached small importance to the factor of descent from the totem, remarks confidently in one passage that in his opinion totemism is nothing more than '*un hypertrophie de l'instinct social*'. (Reinach, 1905-12, 1, 41.) A similar view seems to run through the recent book by Durkheim (1912). The totem, he argues, is the visible representative of social religion among the races concerned: it embodies the community, which is the true object of their worship.

Other writers have sought to find a more precise basis for the participation of the social instincts in the formation of totemic institutions. Thus Haddon (1902)¹ supposes that each primitive clan originally subsisted upon some one species of animal or plant and perhaps traded in that particular article of food and exchanged it with other clans. It would inevitably follow that this clan would be known to the others by the name of the animal which was of such importance to it. At the same time the clan would be bound to become especially familiar with the animal and develop a peculiar interest in it, though this would be founded on no psychical motive other than the most elementary and urgent of human needs, that is, on hunger.

Against this most 'rational' of all the theories of totemism it has been objected that feeding conditions of this kind are never found among primitive races and have probably never existed. Savages are omnivorous, and the more so the lower their condition. Nor is it easy to see how an exclusive diet such as this could have developed into an almost religious attitude to the totem, culminating in absolute abstention from the favourite food.

¹ Quoted by Frazer (1910, 4, 50).

The first of the three theories on the origin of totemism which Frazer himself has supported at different times was a psychological one, and I shall deal with it later. His second theory, with which we are here concerned, took form under the influence of a momentous publication by two men who had made researches among the natives of Central Australia.

Spencer and Gillen (1899) described a number of peculiar observances, usages and beliefs found in a group of tribes known as the Arunta nation; and Frazer agreed with their opinion that these peculiarities were to be regarded as features of a primitive condition of things and might throw light upon the original and true meaning of totemism.

The peculiarities found in the Arunta tribe (a portion of the Arunta nation) are as follows:

(1) The Arunta are divided into totem clans, but the totem is not hereditary but determined for each individual in a manner to be described presently.

(2) The totem clans are not exogamous; but the restrictions upon marriage are based upon a highly developed division into marriage-classes, which have no connection with the totem.

(3) The function of the totem clans lies in their performing a ceremony which has as its aim the multiplication of the edible totem object by a characteristically magical method. (This ceremony is known as *intichiuma*.)

(4) The Arunta have a peculiar theory of conception and reincarnation. They believe that there are places scattered over the country at each of which the spirits of the dead of some one totem await reincarnation and enter the body of any woman who passes by the spot. When a child is born, the mother reports at which of these places she thinks it was conceived, and the child's totem is determined accordingly. It is further believed that the spirits (both of the dead and of the reborn) are intimately associated with certain peculiar stone amulets, known as *churinga*, which are found at these same centres.

Two factors seem to have led Frazer to suppose that the observances among the Arunta constitute the oldest form of totemism. First, there was the existence of certain myths which declared that the ancestors of the Arunta regularly ate their totem and always married women of their own totem. Secondly, there was the apparent disregard of the sexual act in their theory of conception. People who had not yet discovered that conception is the result of sexual intercourse might surely be regarded as the most backward and primitive of living men.

By focusing his judgement of totemism upon the *intichiuma* ceremony, Frazer came all at once to see the totemic system in an entirely new light: as a purely practical organization for meeting the most natural of human needs. (Cf. Haddon's theory above.)¹ The system was simply an example upon a large scale of 'co-operative magic'. Primitive men set up what might be described as a magical producers' and consumers' union. Each totem clan undertook the business of guaranteeing the plentiful supply of one particular article of food. Where non-edible totems were concerned (such as dangerous animals, or rain, wind, etc.) the duty of the totem clan lay in controlling the natural force in question and in counteracting its injurious possibilities. The achievements of each clan were to the advantage of all the rest. Since each clan might eat none, or only very little, of its own totem, it provided that valuable material for the other clans and was itself provided in exchange with what *they* produced as their social totemic duty. In the light of the insight which he thus obtained from the *intichiuma* ceremony, Frazer came to believe that the prohibition against eating one's own totem had blinded people to the more important element in the situation, namely the injunction to produce as much as possible of an edible totem to meet the needs of other people.

Frazer accepted the Arunta tradition that each totem clan had originally eaten its own totem without restriction. But it was then difficult to understand the next stage in development, at which the clansmen became content with assuring a supply of the totem for others, while themselves renouncing its enjoyment almost completely. He supposed that this restriction had arisen, not from any kind of religious deference, but perhaps from observing that animals never fed upon their own kind: to do so might imply a breach in their identification with their totem and consequently reduce their power of controlling it. Or it might be that by sparing the creatures they hoped to conciliate them. Frazer, however, makes no disguise of the difficulties involved in these explanations (1910, 1, 121 ff.); nor does he venture to suggest by what means the custom described in the Arunta myths of marrying within the totem was transformed into exogamy.

¹ 'There is nothing vague or mystical about it, nothing of that metaphysical haze which some writers love to conjure up over the humble beginnings of human speculation, but which is utterly foreign to the simple, sensuous and concrete modes of thought of the savage.' (Frazer, 1910, 1, 117.)

The theory based by Frazer on the *intichiuma* ceremony stands or falls with the assertion of the primitive character of the Arunta institutions. But in face of the objections raised by Durkheim¹ and Lang (1903 and 1905), that assertion appears untenable. On the contrary, the Arunta seem to be the most highly developed of the Australian tribes and to represent a stage of totemism in dissolution rather than its beginnings. The myths which impressed Frazer so deeply because, in contrast to the conditions that rule to-day, they lay stress upon liberty to eat the totem and to marry within the totem - these myths are easily explicable as wishful phantasies which, like the myth of a Golden Age, have been projected back into the past.

(γ) *Psychological Theories*

Frazer's first psychological theory, formed before he became acquainted with Spencer and Gillen's observations, was based on the belief in an 'external soul'.² The totem, according to this view, represented a safe place of refuge in which the soul could be deposited and so escape the dangers which threatened it. When a primitive man had deposited his soul in his totem he himself was invulnerable, and he naturally avoided doing any injury to the receptacle of his soul. Since, however, he did not know in which particular individual of the animal species concerned his own soul was lodged, it was reasonable for him to spare the whole species.

¹ In *L'année sociologique* (1898, 1902, 1905, etc.); see especially 'Sur le totémisme' (1902).

² See Frazer, *The Golden Bough*, First Edition (1890), 2, 332 ff.

Frazer himself subsequently abandoned this theory that totemism was derived from a belief in souls; and, after coming to know of Spencer and Gillen's observations, adopted the sociological theory which I have already discussed. But he came to see himself that the motive from which that second theory derived totemism was too 'rational' and that it implied a social organization which was too complicated to be described as primitive.¹ The magical co-operative societies now seemed to him to be the fruit rather than the seed of totemism. He sought for some simpler factor, some primitive superstition behind these structures, to which the origin of totemism might be traced back. At last he found this original factor in the Arunta's remarkable story of conception.

The Arunta, as I have already explained, eliminate the connection between the sexual act and conception. At the moment at which a woman feels she is a mother, a spirit, which has been awaiting reincarnation in the nearest totem centre where the spirits of the dead collect, has entered her body. She will bear this spirit as a child, and the child will have the same totem as all the spirits waiting at that particular centre. This theory of conception cannot explain totemism, since it presupposes the existence of totems. But let us go back a step further and suppose that originally the woman believed that the animal, plant, stone or other object, with which her imagination was occupied at the moment when she first felt she was a mother, actually made its way into her and was later born in human form. In that case the identity between a man and his totem would have a factual basis in his mother's belief and all the remaining totem ordinances (with the exception of exogamy) would follow. A man would refuse to eat this animal or plant because to do so would amount to eating himself. He would, however, have a reason for occasionally partaking of his totem in a ceremonial manner, because in that way he might strengthen his identification with the totem, which is the essence of totemism. Some observations made by Rivers upon the natives of the Banks' Islands² seemed to prove a direct identification of human beings with their totem on the basis of a similar theory of conception.

¹ 'It is unlikely that a community of savages should deliberately parcel out the realm of nature into provinces, assign each province to a particular band of magicians, and bid all the bands to work their magic and weave their spells for the common good.' (Frazer, 1910, 4, 57.)

² Quoted by Frazer (1910, 2, 89 ff. and 4, 59).

Accordingly, the ultimate source of totemism would be the savages' ignorance of the process by which men and animals reproduce their kind; and, in particular, ignorance of the part played by the male in fertilization. This ignorance must have been facilitated by the long interval between the act of fertilization and the birth of the child (or the first perception of its movements). Thus totemism would be a creation of the feminine rather than of the masculine mind: its roots would lie in 'the sick fancies of pregnant women'. 'Anything indeed that struck a woman at that mysterious moment of her life when she first knows herself to be a mother might easily be identified by her with the child in her womb. Such maternal fancies, so natural and seemingly so universal, appear to be the root of totemism.' (Frazer, 1910, 4, 63.)

The main objection to this third of Frazer's theories is the same as has already been brought against the second or sociological one. The Arunta seem to be far removed from the beginnings of totemism. Their denial of paternity does not appear to rest upon primitive ignorance; in some respects they themselves make use of descent through the father. They seem to have sacrificed paternity for the sake of some sort of speculation designed to honour the souls of their ancestors.¹ They have enlarged the myth of the impregnation of a virgin by the spirit into a general theory of conception; but that is no reason why ignorance of the conditions governing fertilization should be imputed to them any more than to the peoples of antiquity at the time of the origin of the Christian myths.

Another psychological theory of the origin of totemism has been advanced by a Dutchman, G. A. Wilken. It connects totemism with the belief in the transmigration of souls. 'The animal in which the souls of the dead are thought by preference to be incarnate becomes a kinsman, an ancestor, and as such is revered.'² It seems more likely, however, that the belief in transmigration was derived from totemism than vice versa.

¹ 'That belief is a philosophy far from primitive.' (Lang, 1905, 192.)

² Quoted by Frazer (1910, 4, 45 f.).

Yet another theory of totemism is held by some eminent American ethnologists, Franz Boas, C. Hill-Tout, and others. It is based upon observations on North American Indian totemic clans and maintains that the totem was originally the guardian spirit of an ancestor, who acquired it in a dream and transmitted it to his descendants. We have already heard the difficulties which stand in the way of the view that totems are inherited from single individuals; but apart from this, the Australian evidence lends no support to the theory that totems are derived from guardian spirits. (Frazer, 1910, 4, 48 ff.)

The last of the psychological theories, that put forward by Wundt (1912, 190), is based upon two facts. 'In the first place, the original totem, and the one which continues to remain most common, is the animal; and, secondly, the earliest totem animals are identical with soul animals.' Soul animals (such as birds, snakes, lizards and mice) are appropriate receptacles of souls which have left the body, on account of their rapid movements or flight through the air or of other qualities likely to produce surprise or alarm. Totem animals are derived from the transformations of the 'breath-soul' into animals. Thus, according to Wundt, totemism is directly connected with the belief in spirits, that is to say with animism.

(b) and (c) THE ORIGIN OF EXOGAMY AND ITS RELATION TO TOTEMISM

I have set out the different theories about totemism in some detail, though even so compression has been inevitable and I fear that my account may have suffered in consequence. In what follows, however, I shall venture, for my readers' sake, to be still more condensed. The discussions on the exogamy practised by totemic peoples are, owing to the nature of the material with which they deal, particularly complicated and diffuse one might even say confused. The purposes of the present work make it possible for me to limit myself to tracing certain of the main lines of dispute, while referring those who wish to enter into the subject more deeply to the specialized writings from which I have so frequently quoted.

The attitude taken by an author on the problems of exogamy must naturally depend to some extent on the position he has adopted towards the various theories of totemism. Some of the explanations of totemism exclude any connection with exogamy, so that the two institutions fall completely apart. Thus we find two opposing views: one which seeks to maintain the original presumption that exogamy forms an inherent part of the totemic system, and the other which denies that there is any such connection and holds that the convergence between these two features of the oldest cultures is a chance one. This latter opinion has been adopted without qualification by Frazer in his later works: 'I must request the reader to bear constantly in mind', he writes, 'that the two institutions of totemism and exogamy are fundamentally distinct in origin and nature, though they have accidentally crossed and blended in many tribes.' (Frazer, 1910, 1, xii.) He gives an explicit warning that the opposite view must be a source of endless difficulties and misunderstandings.

Other writers have, on the contrary, found a means of regarding exogamy as an inevitable consequence of the basic principles of totemism. Durkheim (1898, 1902 and 1905) has put forward the view that the taboo attached to totems was bound to involve prohibition against practising sexual intercourse with a woman of the same totem. The totem is of the same blood as the man and consequently the ban upon shedding blood (in connection with defloration and menstruation) prohibits him from sexual relations with a woman belonging to his totem.¹ Andrew Lang (1905, 125), who agrees with Durkheim on this subject, believes that the prohibition against women of the same clan might operate even without any blood taboo. The general totem taboo (which, for instance, forbids a man to sit under his own totem tree) would, in Lang's opinion, have been sufficient. Incidentally, he complicates this with another explanation of exogamy (see below) and omits to show how the two explanations are related to each other.

¹ See the criticisms of Durkheim's views by Frazer (1910, 4, 100 ff.).

As regards the chronological relations between the two institutions, most of the authorities agree that totemism is the older of them and that exogamy arose later.¹

Of the theories which seek to show that exogamy is independent of totemism I shall only draw attention to a few which throw light on the attitude of the different authors to the problem of incest.

McLennan (1865) ingeniously inferred the existence of exogamy from the vestiges of customs which seemed to indicate the earlier practice of marriage by capture. He formed a hypothesis that in the earliest times it had been a general usage for men to obtain their wives from another group and that marriage with a woman of their own group gradually 'came to be considered improper because it was unusual'. He accounted for the prevalence of exogamy by supposing that the practice of killing the majority of female children at birth had led to a scarcity of women in primitive societies. We are not here concerned with the question of how far these assumptions of McLennan's are supported by the actual findings. What interests us far more is the fact that his hypotheses fail to explain why the male members of a group should refuse themselves access to the few remaining women of their own blood - the fact that he entirely overlooks the problem of incest. (Frazer, 1910, 4, 71-92.)

Other students of exogamy, on the contrary, and evidently with greater justice, have seen in exogamy an institution for the prevention of incest.² When one considers the gradually increasing complication of the Australian restrictions upon marriage, it is impossible not to accept the opinions of Morgan (1877), Frazer (1910, 4, 105 ff.), Howitt and Baldwin Spencer that those regulations bear (in Frazer's words) 'the impress of deliberate design' and that they aimed at achieving the result they have in fact achieved. 'In no other way does it seem possible to explain in all its details a system at once so complex and so regular.' (Frazer, *ibid.*, 106.)

It is interesting to observe that the first restrictions produced by the introduction of marriage-classes affected the sexual freedom of the *younger* generation (that is, incest between brothers and sisters and between sons and mothers) whereas incest between fathers and daughters was only prevented by a further extension of the regulations.

¹ See, for instance, Frazer (1910, 4, 75): 'The totemic clan is a totally different social organism from the exogamous clan, and we have good grounds for thinking that it is far older.'

² Cf. the first essay in this work.

But the fact that exogamous sexual restrictions were imposed intentionally throws no light on the motive which led to their imposition. What is the ultimate source of the horror of incest which must be recognized as the root of exogamy? To explain it by the existence of an instinctive dislike of sexual intercourse with blood relatives - that is to say, by an appeal to the fact that there is a horror of incest - is clearly unsatisfactory; for social experience shows that, in spite of this supposed instinct, incest is no uncommon event even in our present-day society, and history tells us of cases in which incestuous marriage between privileged persons was actually the rule.

Westermarck (1906-8, 2, 368)¹ has explained the horror of incest on the ground that 'there is an innate aversion to sexual intercourse between persons living very closely together from early youth, and that, as such persons are in most cases related by blood, this feeling would naturally display itself in custom and law as a horror of intercourse between near kin'. Havelock Ellis, though he disputed the instinctiveness of the aversion, subscribed to this explanation in the main: 'The normal failure of the pairing instinct to manifest itself in the case of brothers and sisters, or of boys and girls brought up together from infancy, is a merely negative phenomenon due to the inevitable absence in those circumstances of the conditions which evoke the pairing instinct. . . . Between those who have been brought up together from childhood all the sensory stimuli of vision, hearing and touch have been dulled by use, trained to the calm level of affection, and deprived of their potency to arouse the erethistic excitement which produces sexual tumescence.'

¹ In the same chapter he replies to various objections which have been raised against his views.

It seems to me very remarkable that Westermarck should consider that this innate aversion to sexual intercourse with those with whom one has been intimate in childhood is also the equivalent in psychical terms of the biological fact that inbreeding is detrimental to the species. A biological instinct of the kind suggested would scarcely have gone so far astray in its psychological expression that, instead of applying to blood relatives (intercourse with whom might be injurious to reproduction), it affected persons who were totally innocuous in this respect, merely because they shared a common home. I cannot resist referring, too, to Frazer's admirable criticism of Westermarck's theory. Frazer finds it inexplicable that to-day there should be scarcely any sexual aversion to intercourse with house-mates, whereas the horror of incest, which on Westermarck's theory is only a derivative of that aversion, should have increased so enormously. But some further comments of Frazer's go deeper, and these I shall reproduce in full, since they are in essential agreement with the arguments which I put forward in my essay on taboo:

'It is not easy to see why any deep human instinct should need to be reinforced by law. There is no law commanding men to eat and drink or forbidding them to put their hands in the fire. Men eat and drink and keep their hands out of the fire instinctively for fear of natural not legal penalties, which would be entailed by violence done to these instincts. The law only forbids men to do what their instincts incline them to do; what nature itself prohibits and punishes, it would be superfluous for the law to prohibit and punish. Accordingly we may always safely assume that crimes forbidden by law are crimes which many men have a natural propensity to commit. If there was no such propensity there would be no such crimes, and if no such crimes were committed what need to forbid them? Instead of assuming, therefore, from the legal prohibition of incest that there is a natural aversion to incest, we ought rather to assume that there is a natural instinct in favour of it, and that if the law represses it, as it represses other natural instincts, it does so because civilized men have come to the conclusion that the satisfaction of these natural instincts is detrimental to the general interests of society.' (Frazer, 1910, 4, 97 f.)

I may add to these excellent arguments of Frazer's that the findings of psycho-analysis make the hypothesis of an innate aversion to incestuous intercourse totally untenable. They have shown, on the contrary, that the earliest sexual excitations of youthful human beings are invariably of an incestuous character and that such impulses when repressed play a part that can scarcely be over-estimated as motive forces of neuroses in later life.

Thus the view which explains the horror of incest as an innate instinct must be abandoned. Nor can anything more favourable be said of another, widely held explanation of the law against incest, according to which primitive peoples noticed at an early date the dangers with which their race was threatened by inbreeding and for that reason deliberately adopted the prohibition. There are a host of objections to this theory. (Cf. Durkheim, 1898.) Not only must the prohibition against incest be older than any domestication of animals which might have enabled men to observe the effects of inbreeding upon racial characters, but even to-day the detrimental results of inbreeding are not established with certainty and cannot easily be demonstrated in man. Moreover, everything that we know of contemporary savages makes it highly improbable that their most remote ancestors were already concerned with the question of preserving their later progeny from injury. Indeed it is almost absurd to attribute to such improvident creatures motives of hygiene and eugenics to which consideration is scarcely paid in our own present-day civilization.¹

Lastly, account must be taken of the fact that a prohibition against inbreeding, based upon practical motives of hygiene, on the ground of its tending to racial enfeeblement, seems quite inadequate to explain the profound abhorrence shown towards incest in our society. As I have shown elsewhere,² this feeling seems to be even more active and intense among contemporary primitive peoples than among civilized ones.

It might have been expected that here again we should have before us a choice between sociological, biological and psychological explanations. (In this connection the psychological motives should perhaps be regarded as representing biological forces.) Nevertheless, at the end of our inquiry, we can only subscribe to Frazer's resigned conclusion. We are ignorant of the origin of the horror of incest and cannot even tell in what direction to look for it. None of the solutions of the enigma that have been proposed seems satisfactory.³

¹ Darwin writes of savages that they 'are not likely to reflect on distant evils to their progeny'.

² See the first essay in this work.

³ 'Thus the ultimate origin of exogamy, and with it of the law of incest - since exogamy was devised to prevent incest - remains a problem nearly as dark as ever.' (Frazer, 1910, 1, 165.)

I must, however, mention one other attempt at solving it. It is of a kind quite different from any that we have so far considered, and might be described as 'historical'.

This attempt is based upon a hypothesis of Charles Darwin's upon the social state of primitive men. Darwin deduced from the habits of the higher apes that men, too, originally lived in comparatively small groups or hordes within which the jealousy of the oldest and strongest male prevented sexual promiscuity. 'We may indeed conclude from what we know of the jealousy of all male quadrupeds, armed, as many of them are, with special weapons for battling with their rivals, that promiscuous intercourse in a state of nature is extremely improbable. . . . Therefore, if we look far enough back in the stream of time, . . . judging from the social habits of man as he now exists . . . the most probable view is that primaeval man aboriginally lived in small communities, each with as many wives as he could support and obtain, whom he would have jealously guarded against all other men. Or he may have lived with several wives by himself, like the Gorilla; for all the natives "agree that but one adult male is seen in a band; when the young male grows up, a contest takes place for mastery, and the strongest, by killing and driving out the others, establishes himself as the head of the community". (Dr. Savage, in *Boston Journal of Nat. Hist.*, vol. v, 1845-7, p. 423.) The younger males, being thus expelled and wandering about, would, when at last successful in finding a partner, prevent too close interbreeding within the limits of the same family.' (Darwin, 1871, 2, 362 f.)

Atkinson (1903) seems to have been the first to realize that the practical consequence of the conditions obtaining in Darwin's primal horde must be exogamy for the young males. Each of them might, after being driven out, establish a similar horde, in which the same prohibition upon sexual intercourse would rule owing to its leader's jealousy. In course of time this would produce what grew into a conscious law: 'No sexual relations between those who share a common home.' After the establishment of totemism this regulation would assume another form and would run: 'No sexual relations within the totem.'

Andrew Lang (1905, 114 and 143) accepted this explanation of exogamy. In the same volume, however, he supports the other theory (held by Durkheim), according to which exogamy was a resultant of the totemic laws. It is a little difficult to bring these two points of view into harmony: according to the first theory exogamy would have originated before totemism, while according to the second it would have been derived from it.¹

¹ 'If it be granted that exogamy existed in practice, on the lines of Mr. Darwin's theory, before the totem beliefs lent to the practice a *sacred* sanction, our task is relatively easy. The first practical rule would be that of the jealous Sire, "No males to touch the females in my camp", with expulsion of adolescent sons. *In efflux of time that rule, become habitual*, would be, "No marriage within the local group". Next, let the local groups receive names, such as Emus, Crows, Opossums, Snipes, and the rule becomes, "No marriage within the local group of animal name; no Snipe to marry Snipe". But, if the primal groups were not exogamous, they would become so, as soon as totemic myths and tabus were developed out of the animal, vegetable, and other names of local groups.' (Lang, 1905, 143.) (The italics in the middle of this passage are mine.) In his last discussion of this subject, moreover, Lang (1911) states that he has 'abandoned the idea that exogamy is a consequence of the general totemic taboo'.

(3)

Into this obscurity one single ray of light is thrown by psycho-analytic observation.

There is a great deal of resemblance between the relations of children and of primitive men towards animals. Children show no trace of the arrogance which urges adult civilized men to draw a hard-and-fast line between their own nature and that of all other animals. Children have no scruples over allowing animals to rank as their full equals. Uninhibited as they are in the avowal of their bodily needs, they no doubt feel themselves more akin to animals than to their elders, who may well be a puzzle to them.

Not infrequently, however, a strange rift occurs in the excellent relations between children and animals. A child will suddenly begin to be frightened of some particular species of animal and to avoid touching or seeing any individual of that species. The clinical picture of an animal phobia emerges - a very common, and perhaps the earliest, form of psychoneurotic illness occurring in childhood. As a rule the phobia is attached to animals in which the child has hitherto shown a specially lively interest and it has nothing to do with any particular individual animal. There is no large choice of animals that may become objects of a phobia in the case of children living in towns: horses, dogs, cats, less often birds, and with striking frequency very small creatures such as beetles and butterflies. The senseless and immoderate fear shown in these phobias is sometimes attached to animals only known to the child from picture books and fairy tales. On a few rare occasions it is possible to discover what has led to an unusual choice of this kind; and I have to thank Karl Abraham for telling me of a case in which the child himself explained that his fear of wasps was due to their colour and stripes reminding him of tigers, which from all accounts were beasts to be feared.

No detailed analytic examination has yet been made of children's animal phobias, though they would greatly repay study. This neglect has no doubt been due to the difficulty of analysing children of such a tender age. It cannot therefore be claimed that we know the general meaning of these disorders and I myself am of the opinion that this may not turn out to be of a uniform nature. But a few cases of phobias of this kind directed towards the larger animals have proved accessible to analysis and have thus yielded their secret to the investigator. It was the same in every case: where the children concerned were boys, their fear related at bottom to their father and had merely been displaced on to the animal.

Everyone with psycho-analytic experience will no doubt have come across cases of the sort and have derived the same impression from them. Yet I can quote only a few detailed publications on the subject. This paucity of literature is an accidental circumstance and it must not be supposed that our conclusions are based on a few scattered observations. I may mention, for instance, a writer who has studied the neuroses of childhood with great understanding - Dr. M. Wulff, of Odessa. In the course of a case history of a nine-year-old boy he reports that at the age of four the patient had suffered from a dog-phobia. 'When he saw a dog running past in the street, he would weep and call out: "Dear doggie, don't bite me! I'll be good!" By "being good" he meant "not playing on the fiddle" - not masturbating. (Wulff, 1912, 15.) 'The boy's dog-phobia', the author explains, 'was in reality his fear of his father displaced on to dogs; for his curious exclamation "Doggie, I'll be good!" - that is, "I won't masturbate" - was directed to his father, who had forbidden him to masturbate.' Wulff adds a footnote which is in complete agreement with my views and at the same time bears witness to the frequent occurrence of such experiences: 'Phobias of this type (phobias of horses, dogs, cats, fowls and other domestic animals) are, in my opinion, at least as common in childhood as *pavor nocturnus*; and in analysis they almost invariably turn out to be a displacement on to the animals of the child's fear of one of his parents. I should not be prepared to maintain that the same mechanism applies to the widespread phobias of rats and mice.'

I recently published (1909b) an 'Analysis of a Phobia in a Five-Year-Old Boy', the material of which was supplied to me by the little patient's father. The boy had a phobia of horses, and as a result he refused to go out in the street. He expressed a fear that the horse would come into the room and bite him; and it turned out that this must be the punishment for a wish that the horse might fall down (that is, die). After the boy's fear of his father had been removed by reassurances, it became evident that he was struggling against wishes which had as their subject the idea of his father being absent (going away on a journey, dying). He regarded his father (as he made all too clear) as a competitor for the favours of his mother, towards whom the obscure foreshadowings of his budding sexual wishes were aimed. Thus he was situated in the typical attitude of a male child towards his parents to which we have given the name of the 'Oedipus complex' and which we regard in general as the nuclear complex of the neuroses. The new fact that we have learnt from the analysis of 'little Hans' - a fact with an important bearing upon totemism - is that in such circumstances children displace some of their feelings from their father on to an animal.

Analysis is able to trace the associative paths along which this displacement passes - both the fortuitous paths and those with a significant content. Analysis also enables us to discover the *motives* for the displacement. The hatred of his father that arises in a boy from rivalry for his mother is not able to achieve uninhibited sway over his mind; it has to contend against his old-established affection and admiration for the very same person. The child finds relief from the conflict arising out of this double-sided, this ambivalent emotional attitude towards his father by displacing his hostile and fearful feelings on to a *substitute* for his father. The displacement cannot, however, bring the conflict to an end, it cannot effect a clear-cut severance between the affectionate and the hostile feelings. On the contrary, the conflict is resumed in relation to the object on to which the displacement has been made: the ambivalence is extended to *it*. There could be no doubt that little Hans was not only *frightened* of horses; he also approached them with admiration and interest. As soon as his anxiety began to diminish, he identified himself with the dreaded creature: he began to jump about like a horse and in his turn bit his father.¹ At another stage in the resolution of his phobia he did not hesitate to identify his parents with some other large animals.²

¹ Freud (1909*b*).

² In his giraffe phantasy.

It may fairly be said that in these children's phobias some of the features of totemism reappear, but reversed into their negative. We are, however, indebted to Ferenczi (1913a) for an interesting history of a single case which can only be described as an instance of *positive* totemism in a child. It is true that in the case of little Árpád (the subject of Ferenczi's report) his totemic interests did not arise in direct relation with his Oedipus complex but on the basis of its narcissistic precondition, the fear of castration. But any attentive reader of the story of little Hans will find abundant evidence that he, too, admired his father as possessing a big penis and feared him as threatening his own. The same part is played by the father alike in the Oedipus and the castration complexes - the part of a dreaded enemy to the sexual interests of childhood. The punishment which he threatens is castration, or its substitute, blinding.¹

When little Árpád was two and a half years old, he had once, while he was on a summer holiday, tried to micturate into the fowl-house and a fowl had pecked, or pecked *at* his penis. A year later, when he was back in the same place, he himself turned into a fowl; his one interest was in the fowl-house and in what went on there and he abandoned human speech in favour of cackling and crowing. At the time at which the observation was made (when he was five years old) he had recovered his speech, but his interests and his talk were entirely concerned with chickens and other kinds of poultry. They were his only toys and he only sang songs that had some mention of fowls in them. His attitude towards his totem animal was superlatively ambivalent: he showed both hatred and love to an extravagant degree. His favourite game was playing slaughtering fowls. 'The slaughtering of poultry was a regular festival for him. He would dance round the animals' bodies for hours at a time in a state of intense excitement.' But afterwards he would kiss and stroke the slaughtered animal or would clean and caress the toy fowls that he had himself ill-treated.

Little Árpád himself saw to it that the meaning of his strange behaviour should not remain hidden. From time to time he translated his wishes from the totemic language into that of everyday life. 'My father's the cock', he said on one occasion, and another time: 'Now I'm small, now I'm a chicken. When I get bigger I'll be a fowl. When I'm bigger still I'll be a cock.' On another occasion he suddenly said he would like to eat some 'fricassee of mother' (on the analogy of fricassee of chicken). He was very generous in threatening other people with castration, just as he himself had been threatened with it for his masturbatory activities.

¹ For the substitution of blinding for castration - a substitution that occurs, too, in the myth of Oedipus - see Reitler (1913), Ferenczi (1913b), Rank (1913) and Eder (1913).

There was no doubt, according to Ferenczi, as to the sources of Árpád's interest in events in the poultry-yard: 'the continual sexual activity between the cock and hens, the laying of eggs and the hatching out of the young brood' gratified his sexual curiosity, the real object of which was *human* family-life. He showed that he had formed his own choice of sexual objects on the model of life in the hen-run, for he said one day to the neighbour's wife: 'I'll marry you and your sister and my three cousins and the cook; no, not the cook, I'll marry my mother instead.'

Later on we shall be able to assess the worth of this observation more completely. At the moment I will only emphasize two features in it which offer valuable points of agreement with totemism: the boy's complete identification with his totem animal¹ and his ambivalent emotional attitude to it. These observations justify us, in my opinion, in substituting the father for the totem animal in the formula for totemism (in the case of males). It will be observed that there is nothing new or particularly daring in this step forward. Indeed, primitive men say the very same thing themselves, and, where the totemic system is still in force to-day, they describe the totem as their common ancestor and primal father. All we have done is to take at its literal value an expression used by these people, of which the anthropologists have been able to make very little and which they have therefore been glad to keep in the background. Psycho-analysis, on the contrary, leads us to put special stress upon this same point and to take it as the starting-point of our attempt at explaining totemism.²

¹ This, according to Frazer (1910, 4, 5), constitutes 'the whole essence of totemism': 'totemism is an identification of a man with his totem.'

² I have to thank Otto Rank for bringing to my notice a dog-phobia in an intelligent young man. His explanation of the way in which he acquired his illness sounds markedly like the totemic theory of the Arunta which I mentioned on [page 2755](#): he thought he had heard from his father that his mother had had a severe fright from a dog during her pregnancy.

The first consequence of our substitution is most remarkable. If the totem animal is the father, then the two principal ordinances of totemism, the two taboo prohibitions which constitute its core - not to kill the totem and not to have sexual relations with a woman of the same totem - coincide in their content with the two crimes of Oedipus, who killed his father and married his mother, as well as with the two primal wishes of children, the insufficient repression or the re-awakening of which forms the nucleus of perhaps every psychoneurosis. If this equation is anything more than a misleading trick of chance, it must enable us to throw a light upon the origin of totemism in the inconceivably remote past. In other words, it would enable us to make it probable that the totemic system - like little Hans's animal phobia and little Árpád's poultry perversion - was a product of the conditions involved in the Oedipus complex. In order to pursue this possibility, we shall have, in the following pages, to study a feature of the totemic system (or, as we might say, of the totemic religion) which I have hitherto scarcely found an opportunity of mentioning.

(4)

William Robertson Smith, who died in 1894 - physicist, philologist, Bible critic and archaeologist - was a man of many-sided interests, clear-sighted and liberal-minded. In his book on the *Religion of the Semites* (first published in 1889) he put forward the hypothesis that a peculiar ceremony known as the 'totem meal' had from the very first formed an integral part of the totemic system. At that time he had only a single piece of evidence in support of his theory: an account of a procedure of the kind dating from the fifth century A.D. But by an analysis of the nature of sacrifice among the ancient Semites he was able to lend his hypothesis a high degree of probability. Since sacrifice implies a divinity, it was a question of arguing back from a comparatively high phase of religious ritual to the lowest one, that is, to totemism.

I will now attempt to extract from Robertson Smith's admirable work those of his statements on the origin and meaning of the ritual of sacrifice which are of decisive interest for us. In so doing I must omit all the details, often so fascinating, and neglect all the later developments. It is quite impossible for an abstract such as this to give my readers any notion of the lucidity and convincing force of the original.

Robertson Smith explains that sacrifice at the altar was the essential feature in the ritual of ancient religions. It plays the same part in all religions, so that its origin must be traced back to very general causes, operating everywhere in the same manner. Sacrifice - the sacred act *par excellence* (*sacrificium*, *ἱεροπρωγία*) - originally had a somewhat different meaning, however, from its later one of making an offering to the deity in order to propitiate him or gain his favour. (The non-religious usage of the word followed from this subsidiary sense of 'renunciation'.) It can be shown that, to begin with, sacrifice was nothing other than 'an act of fellowship between the deity and his worshippers'.

The materials offered for sacrifice were things that can be eaten or drunk; men sacrificed to their deity the things on which they themselves lived: flesh, cereals, fruit, wine and oil. Only in the case of flesh were there limitations and exceptions. The god shared the animal sacrifices with his worshippers, the vegetable offerings were for him alone. There is no doubt that animal sacrifices were the older and were originally the only ones. Vegetable sacrifices arose from the offering of first-fruits and were in the nature of a tribute to the lord of the earth and of the land; but animal sacrifices are more ancient than agriculture.

Linguistic survivals make it certain that the portion of the sacrifice allotted to the god was originally regarded as being literally his food. As the nature of gods grew progressively less material, this conception became a stumbling-block. It was avoided by assigning to the deity only the *liquid* part of the meal. Later, the use of fire, which caused the flesh of the sacrifice upon the altar to rise in smoke, afforded a method of dealing with human food more appropriate to the divine nature. The drink-offering consisted originally of the blood of the animal victim. This was later replaced by wine. In ancient times wine was regarded as 'the blood of the grape', and it has been so described by modern poets.

The oldest form of sacrifice, then, older than the use of fire or the knowledge of agriculture, was the sacrifice of animals, whose flesh and blood were enjoyed in common by the god and his worshippers. It was essential that each one of the participants should have his share of the meal.

A sacrifice of this kind was a public ceremony, a festival celebrated by the whole clan. Religion in general was an affair of the community and religious duty was a part of social obligation. Everywhere a sacrifice involves a feast and a feast cannot be celebrated without a sacrifice. The sacrificial feast was an occasion on which individuals rose joyously above their own interests and stressed the mutual dependence existing between one another and their god.

The ethical force of the public sacrificial meal rested upon very ancient ideas of the significance of eating and drinking together. Eating and drinking with a man was a symbol and a confirmation of fellowship and mutual social obligations. What was *directly* expressed by the sacrificial meal was only the fact that the god and his worshippers were 'commensals', but every other point in their mutual relations was included in this. Customs still in force among the Arabs of the desert show that what is binding in a common meal is not a religious factor but the act of eating itself. Anyone who has eaten the smallest morsel of food with one of these Bedouin or has swallowed a mouthful of his milk need no longer fear him as an enemy but may feel secure in his protection and help. Not, however, for an unlimited time; strictly speaking, only so long as the food which has been eaten in common remains in the body. Such was the realistic view of the bond of union. It needed repetition in order to be confirmed and made permanent.

But why is this binding force attributed to eating and drinking together? In primitive societies there was only one kind of bond which was absolute and inviolable - that of kinship. The solidarity of such a fellowship was complete. 'A kin was a group of persons whose lives were so bound up together, in what must be called a physical unity, that they could be treated as parts of one common life. . . . In a case of homicide Arabian tribesmen do not say, "The blood of M. or N. has been spilt", naming the man; they say, "Our blood has been spilt". In Hebrew the phrase by which one claims kinship is "I am your bone and your flesh".' Thus kinship implies participation in a common substance. It is therefore natural that it is not merely based on the fact that a man is a part of his mother's substance, having been born of her and having been nourished by her milk, but that it can be acquired and strengthened by food which a man eats later and with which his body is renewed. If a man shared a meal with his god he was expressing a conviction that they were of one substance; and he would never share a meal with one whom he regarded as a stranger.

The sacrificial meal, then, was originally a feast of kinsmen, in accordance with the law that only kinsmen eat together. In our own society the members of a family have their meals in common; but the sacrificial meal bears no relation to the family. Kinship is an older thing than family life, and in the most primitive societies known to us the family contained members of more than one kindred. The man married a woman of another clan and the children inherited their mother's clan; so that there was no communion of kin between the man and the other members of the family. In a family of such a kind there was no common meal. To this day, savages eat apart and alone and the religious food prohibitions of totemism often make it impossible for them to eat in common with their wives and children.

Let us now turn to the sacrificial animal. As we have heard, there is no gathering of a clan without an animal sacrifice, nor - and this now becomes significant - any slaughter of an animal except upon these ceremonial occasions. While game and the milk of domestic animals might be consumed without any qualms, religious scruples made it impossible to kill a domestic animal for private purposes. There cannot be the slightest doubt, says Robertson Smith, that the slaughter of a victim was originally among the acts which *'are illegal to an individual, and can only be justified when the whole clan shares the responsibility of the deed.'*¹ So far as I know, there is only one class of actions recognized by early nations to which this description applies, viz. actions which involve an invasion of the sanctity of the tribal blood. In fact, a life which no single tribesman is allowed to invade, and which can be sacrificed only by the consent and common action of the kin, stands on the same footing with the life of the fellow-tribesman.' The rule that every participant at the sacrificial meal must eat a share of the flesh of the victim has the same meaning as the provision that the execution of a guilty tribesman must be carried out by the tribe as a whole. In other words, the sacrificial animal was treated as a member of the tribe; *the sacrificing community, the god and the sacrificial animal were of the same blood and members of one clan.*

Robertson Smith brings forward copious evidence for identifying the sacrificial animal with the primitive totem animal. In later antiquity there were two classes of sacrifice: one in which the victims were domestic animals of the kinds habitually used for eating, and the other extraordinary sacrifices of animals which were unclean and whose consumption was forbidden. Investigation shows that these unclean animals were sacred animals, that they were offered as sacrifices to the gods to whom they were sacred, that originally they were identical with the gods themselves, and that by means of the sacrifice the worshippers in some way laid stress upon their blood kinship with the animal and the god. But in still earlier times this distinction between ordinary and 'mystic' sacrifices disappears. Originally *all* animals were sacred, their flesh was forbidden meat and might only be consumed on ceremonial occasions and with the participation of the whole clan. The slaughter of an animal was equivalent to a shedding of the tribal blood and could occur subject only to the same precautions and the same insurances against incurring reproach.

¹ [This sentence is italicized by Freud.]

The domestication of animals and the introduction of cattle-breeding seems everywhere to have brought to an end the strict and unadulterated totemism of *primaeval* days.¹ But such sacred character as remained to domestic animals under what had then become 'pastoral' religion is obvious enough to allow us to infer its original totemic nature. Even in late classical times ritual prescribed in many places that the sacrificial priest must take to flight after performing the sacrifice, as though to escape retribution. The idea that slaughtering oxen was a crime must at one time have prevailed generally in Greece. At the Athenian festival of Buphonia a regular trial was instituted after the sacrifice, and all the participants were called as witnesses. At the end of it, it was agreed that the responsibility for the murder should be placed upon the knife; and this was accordingly cast into the sea.

In spite of the ban protecting the lives of sacred animals in their quality of fellow-clansmen, a necessity arose for killing one of them from time to time in solemn communion and for dividing its flesh and blood among the members of the clan. The compelling motive for this deed reveals the deepest meaning of the nature of sacrifice. We have heard how in later times, whenever food is eaten in common, the participation in the same substance establishes a sacred bond between those who consume it when it has entered their bodies. In ancient times this result seems only to have been effected by participation in the substance of a *sacrosanct* victim. *The holy mystery of sacrificial death 'is justified by the consideration that only in this way can the sacred cement be procured which creates or keeps alive a living bond of union between the worshippers and their god.'*²(Ibid., 313.)

This bond is nothing else than the life of the sacrificial animal, which resides in its flesh and in its blood and is distributed among all the participants in the sacrificial meal. A notion of this kind lies at the root of all the blood covenants by which men made compacts with each other even at a late period of history. This completely literal way of regarding blood-kinship as identity of substance makes it easy to understand the necessity for renewing it from time to time by the physical process of the sacrificial meal.

¹ 'The inference is that the domestication to which totemism inevitably leads (when there are any animals capable of domestication) is fatal to totemism.' (Jevons, 1902, 120.)

² [This sentence is italicized by Freud.]

At this point I will interrupt my survey of Robertson Smith's line of thought and restate the gist of it in the most concise terms. With the establishment of the idea of private property sacrifice came to be looked upon as a gift to the deity, as a transference of property from men to the god. But this interpretation left unexplained all the peculiarities of the ritual of sacrifice. In the earliest times the sacrificial animal had itself been sacred and its life untouchable; it might only be killed if all the members of the clan participated in the deed and shared their guilt in the presence of the god, so that the sacred substance could be yielded up and consumed by the clansmen and thus ensure their identity with one another and with the deity. The sacrifice was a sacrament and the sacrificial animal was itself a member of the clan. It was in fact the ancient totem animal, the primitive god himself, by the killing and consuming of which the clans men renewed and assured their likeness to the god.

From this analysis of the nature of sacrifice Robertson Smith draws the conclusion that the periodic killing and eating of the totem in times *before the worship of anthropomorphic deities* had been an important element in totemic religion. The ceremonial of a totem meal of this kind is, he suggests, to be found in a description of a sacrifice of comparatively late date. St. Nilus records a sacrificial ritual current among the Bedouin of the Sinai Desert at the end of the fourth century A.D. The victim of the sacrifice, a camel, 'is bound upon a rude altar of stones piled together, and when the leader of the band has thrice led the worshippers round the altar in a solemn procession accompanied with chants, he inflicts the first wound . . . and in all haste drinks of the blood that gushes forth. Forthwith the whole company fall on the victim with their swords, hacking off pieces of the quivering flesh and devouring them raw with such wild haste, that in the short interval between the rise of the day star¹ which marked the hour for the service to begin, and the disappearance of its rays before the rising sun, the entire camel, body and bones, skin, blood and entrails, is wholly devoured.' All the evidence goes to show that this barbaric ritual, which bears every sign of extreme antiquity, was no isolated instance but was everywhere the original form taken by totemic sacrifice, though later toned down in many different directions.

¹ To which the sacrifice was offered.

Many authorities have refused to attach importance to the concept of the totem meal, because it was not supported by any direct observation at the level of totemism. Robertson Smith himself pointed to instances in which the sacramental significance of the sacrifice seemed to be assured: for instance, the human sacrifices of the Aztecs, and others which recall the circumstances of the totem meal - the sacrifice of bears by the Bear clan of the Ouataouak tribe in America and the bear feast of the Aino in Japan. These and similar cases have been reported in detail by Frazer in the Fifth Part of his great work (1912, 2). An American Indian tribe in California, which worship a large bird of prey (a buzzard), kill it once a year at a solemn festival, after which it is mourned and its skin and feathers are preserved. The Zuni Indians of New Mexico behave in a similar way to their sacred turtles.

A feature has been observed in the *intichiuma* ceremonies of the Central Australian tribes which agrees admirably with Robertson Smith's conjectures. Each clan, when it is performing magic for the multiplication of its totem (which it itself is normally prohibited from consuming), is obliged during the ceremony to eat a small portion of its own totem before making it accessible to the other clans. According to Frazer (*ibid.*, 2, 590) the clearest example of a sacramental consumption of an otherwise prohibited totem is to be found among the Bini of West Africa in connection with their funeral ceremonies.

Accordingly, I propose that we should adopt Robertson Smith's hypothesis that the sacramental killing and communal eating of the totem animal, whose consumption was forbidden on all other occasions, was an important feature of totemic religion.¹

¹ I am not unaware of the objections to this theory of sacrifice which have been brought forward by various writers (such as Marillier, Hubert and Mauss, etc.); but they have not diminished to any important extent the impression produced by Robertson Smith's hypothesis.

(5)

Let us call up the spectacle of a totem meal of the kind we have been discussing, amplified by a few probable features which we have not yet been able to consider. The clan is celebrating the ceremonial occasion by the cruel slaughter of its totem animal and is devouring it raw - blood, flesh and bones. The clansmen are there, dressed in the likeness of the totem and imitating it in sound and movement, as though they are seeking to stress their identity with it. Each man is conscious that he is performing an act forbidden to the individual and justifiable only through the participation of the whole clan; nor may any one absent himself from the killing and the meal. When the deed is done, the slaughtered animal is lamented and bewailed. The mourning is obligatory, imposed by dread of a threatened retribution. As Robertson Smith (1894, 412) remarks of an analogous occasion, its chief purpose is to disclaim responsibility for the killing.

But the mourning is followed by demonstrations of festive rejoicing: every instinct is unfettered and there is licence for every kind of gratification. Here we have easy access to an understanding of the nature of festivals in general. A festival is a permitted, or rather an obligatory, excess, a solemn breach of a prohibition. It is not that men commit the excesses because they are feeling happy as a result of some injunction they have received. It is rather that excess is of the essence of a festival; the festive feeling is produced by the liberty to do what is as a rule prohibited.

What are we to make, though, of the prelude to this festive joy - the mourning over the death of the animal? If the clansmen rejoice over the killing of the totem - a normally forbidden act - why do they mourn over it as well?

As we have seen, the clansmen acquire sanctity by consuming the totem: they reinforce their identification with it and with one another. Their festive feelings and all that follows from them might well be explained by the fact that they have taken into themselves the sacred life of which the substance of the totem is the vehicle.

Psycho-analysis has revealed that the totem animal is in reality a substitute for the father; and this tallies with the contradictory fact that, though the killing of the animal is as a rule forbidden, yet its killing is a festive occasion - with the fact that it is killed and yet mourned. The ambivalent emotional attitude, which to this day characterizes the father-complex in our children and which often persists into adult life, seems to extend to the totem animal in its capacity as substitute for the father.

If, now, we bring together the psycho-analytic translation of the totem with the fact of the totem meal and with Darwin's theories of the earliest state of human society, the possibility of a deeper understanding emerges - a glimpse of a hypothesis which may seem fantastic but which offers the advantage of establishing an unsuspected correlation between groups of phenomena that have hitherto been disconnected.

There is, of course, no place for the beginnings of totemism in Darwin's primal horde. All that we find there is a violent and jealous father who keeps all the females for himself and drives away his sons as they grow up. This earliest state of society has never been an object of observation. The most primitive kind of organization that we actually come across - and one that is in force to this day in certain tribes - consists of bands of males; these bands are composed of members with equal rights and are subject to the restrictions of the totemic system, including inheritance through the mother. Can this form of organization have developed out of the other one? and if so along what lines?

If we call the celebration of the totem meal to our help, we shall be able to find an answer. One day¹ the brothers who had been driven out came together, killed and devoured their father and so made an end of the patriarchal horde. United, they had the courage to do and succeeded in doing what would have been impossible for them individually. (Some cultural advance, perhaps, command over some new weapon, had given them a sense of superior strength.) Cannibal savages as they were, it goes without saying that they devoured their victim as well as killing him. The violent primal father had doubtless been the feared and envied model of each one of the company of brothers: and in the act of devouring him they accomplished their identification with him, and each one of them acquired a portion of his strength. The totem meal, which is perhaps mankind's earliest festival, would thus be a repetition and a commemoration of this memorable and criminal deed, which was the beginning of so many things - of social organization, of moral restrictions and of religion.¹

¹ To avoid possible misunderstanding, I must ask the reader to take into account the final sentences of the following footnote as a corrective to this description.

² This hypothesis, which has such a monstrous air, of the tyrannical father being overwhelmed and killed by a combination of his exiled sons, was also arrived at by Atkinson (1903, 220 f.) as a direct implication of the state of affairs in Darwin's primal horde: 'The patriarch had only one enemy whom he should dread . . . a youthful band of brothers living together in forced celibacy, or at most in polyandrous relation with some single female captive. A horde as yet weak in their impubescence they are, but they would, when strength was gained with time, inevitably wrench by combined attacks, renewed again and again, both wife and life from the paternal tyrant.' Atkinson, who incidentally passed his whole life in New Caledonia and had unusual opportunities for studying the natives, also pointed out that the conditions which Darwin assumed to prevail in the primal horde may easily be observed in herds of wild oxen and horses and regularly lead to the killing of the father of the herd. He further supposed that, after the father had been disposed of, the horde would be disintegrated by a bitter struggle between the victorious sons. Thus any new organization of society would be precluded: there would be 'an ever-recurring violent succession to the solitary paternal tyrant, by sons whose parricidal hands were so soon again clenched in fratricidal strife.' (Ibid., 228.) Atkinson, who had no psycho-analytic hints to help him and who was ignorant of Robertson Smith's studies, found a less violent transition from the primal horde to the next social stage, at which numbers of males live together in a peaceable community. He believed that through the intervention of maternal love the sons - to begin with only the youngest, but later others as well - were allowed to remain with the horde, and that in return for this toleration the sons acknowledged their father's sexual privilege by renouncing all claim to their mother and sisters.

Such is the highly remarkable theory put forward by Atkinson. In its essential feature it is in agreement with my own; but its divergence results in its failing to effect a correlation with many other issues.

The lack of precision in what I have written in the text above, its abbreviation of the time factor and its compression of the whole subject matter, may be attributed to the reserve necessitated by the nature of the topic. It would be as foolish to aim at exactitude in such questions as it would be unfair to insist upon certainty.

In order that these latter consequences may seem plausible, leaving their premises on one side, we need only suppose that the tumultuous mob of brothers were filled with the same contradictory feelings which we can see at work in the ambivalent father-complexes of our children and of our neurotic patients. They hated their father, who presented such a formidable obstacle to their craving for power and their sexual desires; but they loved and admired him too. After they had got rid of him, had satisfied their hatred and had put into effect their wish to identify themselves with him, the affection which had all this time been pushed under was bound to make itself felt.¹ It did so in the form of remorse. A sense of guilt made its appearance, which in this instance coincided with the remorse felt by the whole group. The dead father became stronger than the living one had been - for events took the course we so often see them follow in human affairs to this day. What had up to then been prevented by his actual existence was thenceforward prohibited by the sons themselves, in accordance with the psychological procedure so familiar to us in psycho-analyses under the name of 'deferred obedience'. They revoked their deed by forbidding the killing of the totem, the substitute for their father; and they renounced its fruits by resigning their claim to the women who had now been set free. They thus created out of their filial sense of guilt the two fundamental taboos of totemism, which for that very reason inevitably corresponded to the two repressed wishes of the Oedipus complex. Whoever contravened those taboos became guilty of the only two crimes with which primitive society concerned itself.²

¹ This fresh emotional attitude must also have been assisted by the fact that the deed cannot have given complete satisfaction to those who did it. From one point of view it had been done in vain. Not one of the sons had in fact been able to put his original wish - of taking his father's place - into effect. And, as we know, failure is far more propitious for a moral reaction than satisfaction.

² 'Murder and incest, or offences of a like kind against the sacred laws of blood, are in primitive society the only crimes of which the community as such takes cognizance.' (Smith, 1894, 419.)

The two taboos of totemism with which human morality has its beginning are not on a par psychologically. The first of them, the law protecting the totem animal, is founded wholly on emotional motives: the father had actually been eliminated, and in no real sense could the deed be undone. But the second rule, the prohibition of incest, has a powerful practical basis as well. Sexual desires do not unite men but divide them. Though the brothers had banded together in order to overcome their father, they were all one another's rivals in regard to the women. Each of them would have wished, like his father, to have all the women to himself. The new organization would have collapsed in a struggle of all against all, for none of them was of such over-mastering strength as to be able to take on his father's part with success. Thus the brothers had no alternative, if they were to live together, but - not, perhaps, until they had passed through many dangerous crises - to institute the law against incest, by which they all alike renounced the women whom they desired and who had been their chief motive for despatching their father. In this way they rescued the organization which had made them strong - and which may have been based on homosexual feelings and acts, originating perhaps during the period of their expulsion from the horde. Here, too, may perhaps have been the germ of the institution of matriarchy, described by Bachofen, which was in turn replaced by the patriarchal organization of the family.

On the other hand, the claim of totemism to be regarded as a first attempt at a religion is based on the first of these two taboos - that upon taking the life of the totem animal. The animal struck the sons as a natural and obvious substitute for their father; but the treatment of it which they found imposed on themselves expressed more than the need to exhibit their remorse. They could attempt, in their relation to this surrogate father, to allay their burning sense of guilt, to bring about a kind of reconciliation with their father. The totemic system was, as it were, a covenant with their father, in which he promised them everything that a childish imagination may expect from a father - protection, care and indulgence - while on their side they undertook to respect his life, that is to say, not to repeat the deed which had brought destruction on their real father. Totemism, moreover, contained an attempt at self-justification: 'If our father had treated us in the way the totem does, we should never have felt tempted to kill him.' In this fashion totemism helped to smooth things over and to make it possible to forget the event to which it owed its origin.

Features were thus brought into existence which continued thenceforward to have a determining influence on the nature of religion. Totemic religion arose from the filial sense of guilt, in an attempt to allay that feeling and to appease the father by deferred obedience to him. All later religions are seen to be attempts at solving the same problem. They vary according to the stage of civilization at which they arise and according to the methods which they adopt; but all have the same end in view and are reactions to the same great event with which civilization began and which, since it occurred, has not allowed mankind a moment's rest.

There is another feature which was already present in totemism and which has been preserved unaltered in religion. The tension of ambivalence was evidently too great for any contrivance to be able to counteract it; or it is possible that psychological conditions in general are unfavourable to getting rid of these antithetical emotions. However that may be, we find that the ambivalence implicit in the father-complex persists in totemism and in religions generally. Totemic religion not only comprised expressions of remorse and attempts at atonement, it also served as a remembrance of the triumph over the father. Satisfaction over that triumph led to the institution of the memorial festival of the totem meal, in which the restrictions of deferred obedience no longer held. Thus it became a duty to repeat the crime of parricide again and again in the sacrifice of the totem animal, whenever, as a result of the changing conditions of life, the cherished fruit of the crime - appropriation of the paternal attributes - threatened to disappear. We shall not be surprised to find that the element of filial rebelliousness also emerges, in the *later* products of religion, often in the strangest disguises and transformations.

Hitherto we have followed the developments of the *affectionate* current of feeling towards the father, transformed into remorse, as we find them in religion and in moral ordinances (which are not sharply distinguished in totemism). But we must not overlook the fact that it was in the main with the impulses that led to parricide that the victory lay. For a long time afterwards, the social fraternal feelings, which were the basis of the whole transformation, continued to exercise a profound influence on the development of society. They found expression in the sanctification of the blood tie, in the emphasis upon the solidarity of all life within the same clan. In thus guaranteeing one another's lives, the brothers were declaring that no one of them must be treated by another as their father was treated by them all jointly. They were precluding the possibility of a repetition of their father's fate. To the religiously-based prohibition against killing the totem was now added the socially-based prohibition against fratricide. It was not until long afterwards that the prohibition ceased to be limited to members of the clan and assumed the simple form: 'Thou shalt do no murder.' The patriarchal horde was replaced in the first instance by the fraternal clan, whose existence was assured by the blood tie. Society was now based on complicity in the common crime; religion was based on the sense of guilt and the remorse attaching to it; while morality was based partly on the exigencies of this society and partly on the penance demanded by the sense of guilt.

Thus psycho-analysis, in contradiction to the more recent views of the totemic system but in agreement with the earlier ones, requires us to assume that totemism and exogamy were intimately connected and had a simultaneous origin.

(6)

A great number of powerful motives restrain me from any attempt at picturing the further development of religions from their origin in totemism to their condition to-day. I will only follow two threads whose course I can trace with especial clarity as they run through the pattern: the theme of the totemic sacrifice and the relation of son to father.¹

Robertson Smith has shown us that the ancient totem meal recurs in the original form of sacrifice. The meaning of the act is the same: sanctification through participation in a common meal. The sense of guilt, which can only be allayed by the solidarity of all the participants, also persists. What is new is the clan deity, in whose supposed presence the sacrifice is performed, who participates in the meal as though he were a clansman, and with whom those who consume the meal become identified. How does the god come to be in a situation to which he was originally a stranger?

The answer might be that in the meantime the concept of God had emerged - from some unknown source - and had taken control of the whole of religious life; and that, like everything else that was to survive, the totem meal had been obliged to find a point of contact with the new system. The psycho-analysis of individual human beings, however, teaches us with quite special insistence that the god of each of them is formed in the likeness of his father, that his personal relation to God depends on his relation to his father in the flesh and oscillates and changes along with that relation, and that at bottom God is nothing other than an exalted father. As in the case of totemism, psycho-analysis recommends us to have faith in the believers who call God their father, just as the totem was called the tribal ancestor. If psycho-analysis deserves any attention, then - without prejudice to any other sources or meanings of the concept of God, upon which psycho-analysis can throw no light - the paternal element in that concept must be a most important one. But in that case the father is represented twice over in the situation of primitive sacrifice: once as God and once as the totemic animal victim. And, even granting the restricted number of explanations open to psycho-analysis, one must ask whether this is possible and what sense it can have.

We know that there are a multiplicity of relations between the god and the sacred animal (the totem or the sacrificial victim). (1) Each god usually has an animal (and quite often several animals) sacred to him. (2) In the case of certain specially sacred sacrifices - 'mystic' sacrifices - the victim was precisely the animal sacred to the god (Smith, 1894). (3) The god was often worshipped in the shape of an animal (or, to look at it in another way, animals were worshipped as gods) long after the age of totemism. (4) In myths the god often transforms himself into an animal, and frequently into the animal that is sacred to him.

¹ Cf. the discussion by C. G. Jung (1912), which is governed by views differing in certain respects from mine.

It therefore seems plausible to suppose that the god himself was the totem animal, and that he developed out of it at a later stage of religious feeling. But we are relieved from the necessity for further discussion by the consideration that the totem is nothing other than a surrogate of the father. Thus, while the totem may be the *first* form of father-surrogate, the god will be a later one, in which the father has regained his human shape. A new creation such as this, derived from what constitutes the root of every form of religion - a longing for the father - might occur if in the process of time some fundamental change had taken place in man's relation to the father, and perhaps, too, in his relation to animals.

Signs of the occurrence of changes of this kind may easily be seen, even if we leave on one side the beginning of a mental estrangement from animals and the disrupting of totemism owing to domestication. (See above, [p2777 f.](#)) There was one factor in the state of affairs produced by the elimination of the father which was bound in the course of time to cause an enormous increase in the longing felt for him. Each single one of the brothers who had banded together for the purpose of killing their father was inspired by a wish to become like him and had given expression to it by incorporating parts of their father's surrogate in the totem meal. But, in consequence of the pressure exercised upon each participant by the fraternal clan as a whole, that wish could not be fulfilled. For the future no one could or might ever again attain the father's supreme power, even though that was what all of them had striven for. Thus after a long lapse of time their bitterness against their father, which had driven them to their deed, grew less, and their longing for him increased; and it became possible for an ideal to emerge which embodied the unlimited power of the primal father against whom they had once fought as well as their readiness to submit to him. As a result of decisive cultural changes, the original democratic equality that had prevailed among all the individual clansmen became untenable; and there developed at the same time an inclination, based on veneration felt for particular human individuals, to revive the ancient paternal ideal by creating gods. The notion of a man becoming a god or of a god dying strikes us to-day as shockingly presumptuous; but even in classical antiquity there was nothing revolting in it.¹ The elevation of the father who had once been murdered into a god from whom the clan claimed descent was a far more serious attempt at atonement than had been the ancient covenant with the totem.

¹ 'To us moderns, for whom the breach which divides the human and the divine has deepened into an impassable gulf, such mimicry may appear impious, but it was otherwise with the ancients. To their thinking gods and men were akin, for many families traced their descent from a divinity, and the deification of a man probably seemed as little extraordinary to them as the canonization of a saint seems to a modern Catholic.' (Frazer, 1911, 2, 177 f.)

I cannot suggest at what point in this process of development a place is to be found for the great mother-goddesses, who may perhaps in general have preceded the father-gods. It seems certain, however, that the change in attitude to the father was not restricted to the sphere of religion but that it extended in a consistent manner to that other side of human life which had been affected by the father's removal - to social organization. With the introduction of father-deities a fatherless society gradually changed into one organized on a patriarchal basis. The family was a restoration of the former primal horde and it gave back to fathers a large portion of their former rights. There were once more fathers, but the social achievements of the fraternal clan had not been abandoned; and the gulf between the new fathers of a family and the unrestricted primal father of the horde was wide enough to guarantee the continuance of the religious craving, the persistence of an unappeased longing for the father.

We see, then, that in the scene of sacrifice before the god of the clan the father *is* in fact represented twice over - as the god and as the totemic animal victim. But in our attempts at understanding this situation we must beware of interpretations which seek to translate it in a two-dimensional fashion as though it were an allegory, and which in so doing forget its historical stratification. The two-fold presence of the father corresponds to the two chronologically successive meanings of the scene. The ambivalent attitude towards the father has found a plastic expression in it, and so, too, has the victory of the son's affectionate emotions over his hostile ones. The scene of the father's vanquishment, of his greatest defeat, has become the stuff for the representation of his supreme triumph. The importance which is everywhere, without exception, ascribed to sacrifice lies in the fact that it offers satisfaction to the father for the outrage inflicted on him in the same act in which that deed is commemorated.

As time went on, the animal lost its sacred character and the sacrifice lost its connection with the totem feast; it became a simple offering to the deity, an act of renunciation in favour of the god. God Himself had become so far exalted above mankind that He could only be approached through an intermediary the priest. At the same time divine kings made their appearance in the social structure and introduced the patriarchal system into the state. It must be confessed that the revenge taken by the deposed and restored father was a harsh one: the dominance of authority was at its climax. The subjugated sons made use of the new situation in order to unburden themselves still further of their sense of guilt. They were no longer in any way responsible for the sacrifice as it now was. It was God Himself who demanded it and regulated it. This is the phase in which we find myths showing the god himself killing the animal which is sacred to him and which is in fact himself. Here we have the most extreme denial of the great crime which was the beginning of society and of the sense of guilt. But there is a second meaning to this last picture of sacrifice which is unmistakable. It expresses satisfaction at the earlier father-surrogate having been abandoned in favour of the superior concept of God. At this point the psycho-analytic interpretation of the scene coincides approximately with the allegorical, surface translation of it, which represents the god as overcoming the animal side of his own nature.¹

¹ It is generally agreed that when, in mythologies, one generation of gods is overcome by another, what is denoted is the historical replacement of one religious system by a new one, whether as a result of foreign conquest or of psychological development. In the latter case myth approximates to what Silberer has described as 'functional phenomena'. The view maintained by Jung (1912) that the god who kills the animal is a libidinal symbol implies a concept of libido other than that which has hitherto been employed and seems to me questionable from every point of view.

Nevertheless it would be a mistake to suppose that the hostile impulses inherent in the father-complex were completely silenced during this period of revived paternal authority. On the contrary, the first phases of the dominance of the two new father surrogates - gods and kings - show the most energetic signs of the ambivalence that remains a characteristic of religion.

In his great work, *The Golden Bough*, Frazer puts forward the view that the earliest kings of the Latin tribes were foreigners who played the part of a god and were solemnly executed at a particular festival. The annual sacrifice (or, as a variant, self-sacrifice) of a god seems to have been an essential element in the Semitic religions. The ceremonials of human sacrifice, performed in the most different parts of the inhabited globe, leave very little doubt that the victims met their end as representatives of the deity; and these sacrificial rites can be traced into late times, with an inanimate effigy or puppet taking the place of the living human being. The theanthropic sacrifice of the god, into which it is unfortunately impossible for me to enter here as fully as into animal sacrifice, throws a searching retrospective light upon the meaning of the older forms of sacrifice. It confesses, with a frankness that could hardly be excelled, to the fact that the object of the act of sacrifice has always been the same - namely what is now worshipped as God, that is to say, the father. The problem of the relation between animal and human sacrifice thus admits of a simple solution. The original animal sacrifice was already a substitute for a human sacrifice - for the ceremonial killing of the father; so that, when the father-surrogate once more resumed its human shape, the animal sacrifice too could be changed back into a human sacrifice.

The memory of the first great act of sacrifice thus proved indestructible, in spite of every effort to forget it; and at the very point at which men sought to be at the farthest distance from the motives that led to it, its undistorted reproduction emerged in the form of the sacrifice of the god. I need not enlarge here upon the developments of religious thought which, in the shape of rationalizations, made this recurrence possible. Robertson Smith, who had no thought of our derivation of sacrifice from the great event in human prehistory, states that the ceremonies at the festivals in which the ancient Semites celebrated the death of a deity 'were currently interpreted as the commemoration of a mythical tragedy'. 'The mourning', he declares, 'is not a spontaneous expression of sympathy with the divine tragedy, but obligatory and enforced by fear of supernatural anger. And a chief object of the mourners is to disclaim responsibility for the god's death - a point which has already come before us in connection with theanthropic sacrifices, such as the "ox-murder at Athens".' (Ibid., 412.) It seems most probable that these 'current interpretations' were correct and that the feelings of the celebrants were fully explained by the underlying situation.

Let us assume it to be a fact, then, that in the course of the later development of religions the two driving factors, the son's sense of guilt and the son's rebelliousness, never became extinct. Whatever attempt was made at solving the religious problem, whatever kind of reconciliation was effected between these two opposing mental forces, sooner or later broke down, under the combined influence, no doubt, of historical events, cultural changes and internal psychical modifications.

The son's efforts to put himself in the place of the father-god became ever more obvious. The introduction of agriculture increased the son's importance in the patriarchal family. He ventured upon new demonstrations of his incestuous libido, which found symbolic satisfaction in his cultivation of Mother Earth. Divine figures such as Attis, Adonis and Tammuz emerged, spirits of vegetation and at the same time youthful divinities enjoying the favours of mother goddesses and committing incest with their mother in defiance of their father. But the sense of guilt, which was not allayed by these creations, found expression in myths which granted only short lives to these youthful favourites of the mother-goddesses and decreed their punishment by emasculation or by the wrath of the father in the form of an animal. Adonis was killed by a wild boar, the sacred animal of Aphrodite; Attis, beloved of Cybele, perished by castration.¹ The mourning for these gods and the rejoicings over their resurrection passed over into the ritual of another son-deity who was destined to lasting success.

¹ Fear of castration plays an extremely large part, in the case of the youthful neurotics whom we come across, as an interference in their relations with their father. The illuminating instance reported by Ferenczi (1913a) has shown us how a little boy took as his totem the beast that had pecked at his little penis. When our children come to hear of ritual circumcision, they equate it with castration. The parallel in social psychology to this reaction by children has not yet been worked out, so far as I am aware. In primaeval times and in primitive races, where circumcision is so frequent, it is performed at the age of initiation into manhood and it is at that age that its significance is to be found; it was only as a secondary development that it was shifted back to the early years of life. It is of very great interest to find that among primitive peoples circumcision is combined with cutting the hair and knocking out teeth or is replaced by them, and that our children, who cannot possibly have any knowledge of this, in fact treat these two operations, in the anxiety with which they react to them, as equivalents of castration.

When Christianity first penetrated into the ancient world it met with competition from the religion of Mithras and for a time it was doubtful which of the two deities would gain the victory. In spite of the halo of light surrounding his form, the youthful Persian god remains obscure to us. We may perhaps infer from the sculptures of Mithras slaying a bull that he represented a son who was alone in sacrificing his father and thus redeemed his brothers from their burden of complicity in the deed. There was an alternative method of allaying their guilt and this was first adopted by Christ. He sacrificed his own life and so redeemed the company of brothers from original sin.

The doctrine of original sin was of Orphic origin. It formed a part of the mysteries, and spread from them to the schools of philosophy of ancient Greece. (Reinach, 1905-12, 2, 75 ff.) Mankind, it was said, were descended from the Titans, who had lulled the young Dionysus-Zagreus and had torn him to pieces. The burden of this crime weighed on them. A fragment of Anaximander relates how the unity of the world was broken by a *primaeval sin*,¹ and that whatever issued from it must bear the punishment. The tumultuous mobbing, the killing and the tearing in pieces by the Titans reminds us clearly enough of the totemic sacrifice described by St. Nilus - as, for the matter of that, do many other ancient myths, including, for instance, that of the death of Orpheus himself. Nevertheless, there is a disturbing difference in the fact of the murder having been committed on a *youthful* god.

¹ '*Une sorte de péché proethnique*' (Reinach, 1905-12, 2, 76).

There can be no doubt that in the Christian myth the original sin was one against God the Father. If, however, Christ redeemed mankind from the burden of original sin by the sacrifice of his own life, we are driven to conclude that the sin was a murder. The law of talion, which is so deeply rooted in human feelings, lays it down that a murder can only be expiated by the sacrifice of another life: self-sacrifice points back to blood-guilt.¹ And if this sacrifice of a life brought about atonement with God the Father, the crime to be expiated can only have been the murder of the father.

In the Christian doctrine, therefore, men were acknowledging in the most undisguised manner the guilty *primaeval* deed, since they found the fullest atonement for it in the sacrifice of this one son. Atonement with the father was all the more complete since the sacrifice was accompanied by a total renunciation of the women on whose account the rebellion against the father was started. But at that point the inexorable psychological law of ambivalence stepped in. The very deed in which the son offered the greatest possible atonement to the father brought him at the same time to the attainment of his wishes *against* the father. He himself became God, beside, or, more correctly, in place of, the father. A son-religion displaced the father-religion. As a sign of this substitution the ancient totem meal was revived in the form of communion, in which the company of brothers consumed the flesh and blood of the son - no longer the father - obtained sanctity thereby and identified themselves with him. Thus we can trace through the ages the identity of the totem meal with animal sacrifice, with theanthropic human sacrifice and with the Christian Eucharist, and we can recognize in all these rituals the effect of the crime by which men were so deeply weighed down but of which they must none the less feel so proud. The Christian communion, however, is essentially a fresh elimination of the father, a repetition of the guilty deed. We can see the full justice of Frazer's pronouncement that 'the Christian communion has absorbed within itself a sacrament which is doubtless far older than Christianity'.²

¹ We find that impulses to suicide in a neurotic turn out regularly to be self-punishments for wishes for someone else's death.

² Frazer (1912, 2, 51). No one familiar with the literature of the subject will imagine that the derivation of Christian communion from the totem meal is an idea originating from the author of the present essay.

(7)

An event such as the elimination of the primal father by the company of his sons must inevitably have left ineradicable traces in the history of humanity; and the less it itself was recollected, the more numerous must have been the substitutes to which it gave rise.¹ I shall resist the temptation of pointing out these traces in mythology, where they are not hard to find, and shall turn in another direction and take up a suggestion made by Salomon Reinach in a most instructive essay on the death of Orpheus.²

In the history of Greek art we come upon a situation which shows striking resemblances to the scene of the totem meal as identified by Robertson Smith, and not less profound differences from it. I have in mind the situation of the most ancient Greek tragedy. A company of individuals, named and dressed alike, surrounded a single figure, all hanging upon his words and deeds: they were the Chorus and the impersonator of the Hero. He was originally the only actor. Later, a second and third actor were added, to play as counterpart to the Hero and as characters split off from him; but the character of the Hero himself and his relation to the Chorus remained unaltered. The Hero of tragedy must suffer; to this day that remains the essence of a tragedy. He had to bear the burden of what was known as 'tragic guilt'; the basis of that guilt is not always easy to find, for in the light of our everyday life it is often no guilt at all. As a rule it lay in rebellion against some divine or human authority; and the Chorus accompanied the Hero with feelings of sympathy, sought to hold him back, to warn him and to sober him, and mourned over him when he had met with what was felt as the merited punishment for his rash undertaking.

But why had the Hero of tragedy to suffer? and what was the meaning of his 'tragic guilt'? I will cut the discussion short and give a quick reply. He had to suffer because he was the primal father, the Hero of the great primaeval tragedy which was being re-enacted with a tendentious twist; and the tragic guilt was the guilt which he had to take on himself in order to relieve the Chorus from theirs. The scene upon the stage was derived from the historical scene through a process of systematic distortion - one might even say, as the product of a refined hypocrisy. In the remote reality it had actually been the members of the Chorus who caused the Hero's suffering; now, however, they exhausted themselves with sympathy and regret and it was the Hero himself who was responsible for his own sufferings. The crime which was thrown on to his shoulders, presumptuousness and rebelliousness against a great authority, was precisely the crime for which the members of the Chorus, the company of brothers, were responsible. Thus the tragic Hero became, though it might be against his will, the redeemer of the Chorus.

In Greek tragedy the special subject-matter of the performance was the sufferings of the divine goat, Dionysus, and the lamentation of the goats who were his followers and who identified themselves with him. That being so, it is easy to understand how drama, which had become extinct, was kindled into fresh life in the Middle Ages around the Passion of Christ.

¹ In Ariel's words from *The Tempest*:

Full fathom five thy father lies;
Of his bones are coral made;
Those are pearls that were his eyes:
Nothing of him that doth fade,
But doth suffer a sea-change
Into something rich and strange.

² 'La mort d'Orphée', contained in the volume which I have so often quoted (1905-12, 2, 100 ff.).

At the conclusion, then, of this exceedingly condensed inquiry, I should like to insist that its outcome shows that the beginnings of religion, morals, society and art converge in the Oedipus complex. This is in complete agreement with the psycho-analytic finding that the same complex constitutes the nucleus of all neuroses, so far as our present knowledge goes. It seems to me a most surprising discovery that the problems of social psychology, too, should prove soluble on the basis of one single concrete point - man's relation to his father. It is even possible that yet another psychological problem belongs in this same connection. I have often had occasion to point out that emotional ambivalence in the proper sense of the term - that is, the simultaneous existence of love and hate towards the same object - lies at the root of many important cultural institutions. We know nothing of the origin of this ambivalence. One possible assumption is that it is a fundamental phenomenon of our emotional life. But it seems to me quite worth considering another possibility, namely that originally it formed no part of our emotional life but was acquired by the human race in connection with their father-complex,¹ precisely where the psycho-analytic examination of modern individuals still finds it revealed at its strongest.²

Before I bring my remarks to a close, however, I must find room to point out that, though my arguments have led to a high degree of convergence upon a single comprehensive nexus of ideas, this fact cannot blind us to the uncertainties of my premises or the difficulties involved in my conclusions. I will only mention two of the latter which may have forced themselves on the notice of a number of my readers.

No one can have failed to observe, in the first place, that I have taken as the basis of my whole position the existence of a collective mind, in which mental processes occur just as they do in the mind of an individual. In particular, I have supposed that the sense of guilt for an action has persisted for many thousands of years and has remained operative in generations which can have had no knowledge of that action. I have supposed that an emotional process, such as might have developed in generations of sons who were ill-treated by their father, has extended to new generations which were exempt from such treatment for the very reason that their father had been eliminated. It must be admitted that these are grave difficulties; and any explanation that could avoid presumptions of such a kind would seem to be preferable.

¹ Or, more correctly, their parental complex.

² Since I am used to being misunderstood, I think it worth while to insist explicitly that the derivations which I have proposed in these pages do not in the least overlook the complexity of the phenomena under review. All that they claim is to have added a new factor to the sources, known or still unknown, of religion, morality and society - a factor based on a consideration of the implications of psycho-analysis. I must leave to others the task of synthesizing the explanation into a unity. It does, however, follow from the nature of the new contribution that it could not play any other than a central part in such a synthesis, even though powerful emotional resistance might have to be overcome before its great importance was recognized.

Further reflection, however, will show that I am not alone in the responsibility for this bold procedure. Without the assumption of a collective mind, which makes it possible to neglect the interruptions of mental acts caused by the extinction of the individual, social psychology in general cannot exist. Unless psychical processes were continued from one generation to another, if each generation were obliged to acquire its attitude to life anew, there would be no progress in this field and next to no development. This gives rise to two further questions: how much can we attribute to psychical continuity in the sequence of generations? and what are the ways and means employed by one generation in order to hand on its mental states to the next one? I shall not pretend that these problems are sufficiently explained or that direct communication and tradition - which are the first things that occur to one - are enough to account for the process. Social psychology shows very little interest, on the whole, in the manner in which the required continuity in the mental life of successive generations is established. A part of the problem seems to be met by the inheritance of psychical dispositions which, however, need to be given some sort of impetus in the life of the individual before they can be roused into actual operation. This may be the meaning of the poet's words:

Was du ererbt von deinen Vätern hast,
Erwirb es, um es zu besitzen.¹

The problem would seem even more difficult if we had to admit that mental impulses could be so completely suppressed as to leave no trace whatever behind them. But that is not the case. Even the most ruthless suppression must leave room for distorted surrogate impulses and for reactions resulting from them. If so, however, we may safely assume that no generation is able to conceal any of its more important mental processes from its successor. For psycho-analysis has shown us that everyone possesses in his unconscious mental activity an apparatus which enables him to interpret other people's reactions, that is, to undo the distortions which other people have imposed on the expression of their feelings. An unconscious understanding such as this of all the customs, ceremonies and dogmas left behind by the original relation to the father may have made it possible for later generations to take over their heritage of emotion.

¹ ['What thou hast inherited from thy fathers, acquire it to make it thine.']

Another difficulty might actually be brought forward from psycho-analytic quarters. The earliest moral precepts and restrictions in primitive society have been explained by us as reactions to a deed which gave those who performed it the concept of 'crime'. They felt remorse for the deed and decided that it should never be repeated and that its performance should bring no advantage. This creative sense of guilt still persists among us. We find it operating in an asocial manner in neurotics, and producing new moral precepts and persistent restrictions, as an atonement for crimes that have been committed and as a precaution against the committing of new ones.¹ If, however, we inquire among these neurotics to discover what were the deeds which provoked these reactions, we shall be disappointed. We find no deeds, but only impulses and emotions, set upon evil ends but held back from their achievement. What lie behind the sense of guilt of neurotics are always *psychical* realities and never *factual* ones. What characterizes neurotics is that they prefer psychical to factual reality and react just as seriously to thoughts as normal people do to realities.

May not the same have been true of primitive men? We are justified in believing that, as one of the phenomena of their narcissistic organization, they overvalued their psychical acts to an extraordinary degree.² Accordingly the mere hostile *impulse* against the father, the mere existence of a wishful *phantasy* of killing and devouring him, would have been enough to produce the moral reaction that created totemism and taboo. In this way we should avoid the necessity for deriving the origin of our cultural legacy, of which we justly feel so proud, from a hideous crime, revolting to all our feelings. No damage would thus be done to the causal chain stretching from the beginning to the present day, for psychical reality would be strong enough to bear the weight of these consequences. To this it may be objected that an alteration in the form of society from a patriarchal horde to a fraternal clan did actually take place. This is a powerful argument, but not a conclusive one. The alteration might have been effected in a less violent fashion and none the less have been capable of determining the appearance of the moral reaction. So long as the pressure exercised by the primal father could be felt, the hostile feelings towards him were justified, and remorse on their account would have to await a later day. And if it is further argued that everything derived from the ambivalent relation to the father - taboo and the sacrificial ordinance - is characterized by the deepest seriousness and the most complete reality, this further objection carries just as little weight. For the ceremonials and inhibitions of obsessional neurotics show these same characteristics and are nevertheless derived only from psychical reality - from intentions and not from their execution. We must avoid transplanting a contempt for what is merely thought or wished from our commonplace world, with its wealth of material values, into the world of primitive men and neurotics, of which the wealth lies only within themselves.

¹ Cf. the essay on taboo, the second in this work.

² Cf. the third essay in this work.

Here we are faced by a decision which is indeed no easy one. First, however, it must be confessed that the distinction, which may seem fundamental to other people, does not in our judgement affect the heart of the matter. If wishes and impulses have the full value of facts for primitive men, it is our business to give their attitude our understanding attention instead of correcting it in accordance with our own standards. Let us, then, examine more closely the case of neurosis - comparison with which led us into our present uncertainty. It is not accurate to say that obsessional neurotics, weighed down under the burden of an excessive morality, are defending themselves only against *psychical* reality and are punishing themselves for impulses which were merely *felt*. *Historical* reality has a share in the matter as well. In their childhood they had these evil impulses pure and simple, and turned them into acts so far as the impotence of childhood allowed. Each of these excessively virtuous individuals passed through an evil period in his infancy - a phase of perversion which was the forerunner and precondition of the later period of excessive morality. The analogy between primitive men and neurotics will therefore be far more fully established if we suppose that in the former instance, too, psychical reality - as to the form taken by which we are in no doubt - coincided at the beginning with factual reality: that primitive men actually *did* what all the evidence shows that they intended to do.

Nor must we let ourselves be influenced too far in our judgement of primitive men by the analogy of neurotics. There are distinctions, too, which must be borne in mind. It is no doubt true that the sharp contrast that we make between thinking and doing is absent in both of them. But neurotics are above all *inhibited* in their actions: with them the thought is a complete substitute for the deed. Primitive men, on the other hand, are *uninhibited*: thought passes directly into action. With them it is rather the deed that is a substitute for the thought. And that is why, without laying claim to any finality of judgement, I think that in the case before us it may safely be assumed that 'in the beginning was the Deed'.

THE CLAIMS OF PSYCHO-ANALYSIS TO SCIENTIFIC INTEREST
(1913)

Intentionally left blank

THE CLAIMS OF PSYCHO-ANALYSIS TO SCIENTIFIC INTEREST

PART I

THE PSYCHOLOGICAL INTEREST OF PSYCHO-ANALYSIS

Psycho-analysis is a medical procedure which aims at the cure of certain forms of nervous disease (the neuroses) by a psychological technique. In a small volume published in 1910.¹ I described the evolution of psycho-analysis from Josef Breuer's cathartic procedure and its relation to the theories of Charcot and Pierre Janet.

We may give as instances of disorders that are accessible to psycho-analytic treatment hysterical convulsions and paralysees as well as the various symptoms of obsessional neurosis (obsessive ideas and actions). All of these are conditions which are occasionally subject to spontaneous recovery and are dependent on the personal influence of the physician in a haphazard fashion which has not yet been explained. Psycho-analysis has no therapeutic effect on the severer forms of mental disorder properly so called. But - for the first time in the history of medicine - psycho-analysis has made it possible to get some insight into the origin and mechanism alike of the neuroses and psychoses.

This medical significance of psycho-analysis would not, however, justify me in bringing it to the notice of a circle of *savants* concerned in the synthesis of the sciences. And such a plan must seem particularly premature so long as a large number of psychiatrists and neurologists are opposed to the new therapeutic method and reject both its postulates and its findings. If, nevertheless, I regard the experiment as a legitimate one, it is because psycho-analysis can also claim to be of interest to others than psychiatrists, since it touches upon various other spheres of knowledge and reveals unexpected relations between them and the pathology of mental life.

Accordingly in my present paper I shall leave the medical interest of psycho-analysis on one side and illustrate what I have just asserted of the young science by a series of examples.

¹ *Five Lectures on Psycho-Analysis.*

There are a large number of phenomena related to facial and other expressive movements and to speech, as well as many processes of thought (both in normal and sick people), which have hitherto escaped the notice of psychology because they have been regarded as no more than the results of organic disorder or of some abnormal failure in function of the mental apparatus. What I have in mind are 'parapraxes' (slips of the tongue or pen, forgetfulness, etc.), haphazard actions and dreams in normal people, and convulsive attacks, deliria, visions, and obsessive ideas or acts in neurotic subjects. These phenomena (in so far as they were not entirely neglected, as was the case with the parapraxes) were relegated to pathology and an attempt was made to find 'physiological' explanations of them, though these were invariably unsatisfactory. Psycho-analysis, on the contrary, has been able to show that all these things can be explained by means of hypotheses of a purely psychological nature and can be fitted into the chain of psychical events already known to us. Thus on the one hand psycho-analysis has narrowed the region subject to the physiological point of view and on the other hand has brought a large section of pathology into the sphere of psychology. In this instance the normal phenomena provide the more convincing evidence. Psycho-analysis cannot be accused of having applied to normal cases findings arrived at from pathological material. The evidence in the latter and in the former was reached independently and shows that normal processes and what are described as pathological ones follow the same rules.

I shall now discuss in greater detail two of the normal phenomena with which we are here concerned (phenomena, that is, which can be observed in normal people) - namely, parapraxes and dreams.

By parapraxes, then, I understand the occurrence in healthy and normal people of such events as forgetting words and names that are normally familiar to one, forgetting what one intends to do, making slips of the tongue and pen, misreading, mislaying things and being unable to find them, losing things, making mistakes against one's better knowledge, and certain habitual gestures and movements. All of these have on the whole had little attention paid to them by psychology; they have been classed as instances of 'absent-mindedness' and have been attributed to fatigue, to distracted attention or to the contributory effects of certain slight illnesses. Analytic enquiry, however, shows with enough certainty to satisfy every requirement that these latter factors merely operate as facilitating factors and may be absent. Parapraxes are full-blown psychical phenomena and always have a meaning and an intention. They serve definite purposes which, owing to the prevailing psychological situation, cannot be expressed in any other way. These situations as a rule involve a psychical conflict which prevents the underlying intention from finding direct expression and diverts it along indirect paths. A person who is guilty of a parapraxis may notice it or overlook it; the suppressed intention underlying it may well be familiar to him; but he is usually unaware, without analysis, that that intention is responsible for the parapraxis in question. Analyses of parapraxes are often quite easily and quickly made. If a person's attention is drawn to a blunder, the next thought that occurs to him provides its explanation.

Parapraxes are the most convenient material for anyone who wishes to convince himself of the trustworthiness of psycho-analytic explanations. In a small work, first published in book form in 1904, I presented a large number of examples of this kind, and since then I have been able to add to my collection many contributions from other observers.¹

The commonest motive for suppressing an intention, which has thereafter to be content with finding its expression in a parapraxis, turns out to be the avoidance of unpleasure. Thus, one obstinately forgets a proper name if one nourishes a secret grudge against its owner; one forgets to carry out an intention if one has in fact only formed it unwillingly - only, for instance, under the pressure of some convention; one loses an object, if one has quarrelled with someone of whom the object reminds one - with its original donor, for instance; one gets into the wrong train if one is making a journey unwillingly and would rather be somewhere else. This motive of avoiding unpleasure is seen most clearly where the forgetting of impressions and experiences is concerned - a fact which had already been observed by many writers before psycho-analysis existed. Memory shows its partiality by being ready to prevent the reproduction of impressions with a distressing affect, even though this purpose cannot be achieved in every case.

¹ *The Psychopathology of Everyday Life*. Cf. also works on the subject by Maeder, Brill, Jones, Rank, etc.

In other instances the analysis of a parapraxis is less simple and requires less obvious explanations, on account of the intrusion of a process which we describe as 'displacement'. One may, for instance, forget the name of someone against whom one has no objection; analysis will show, however, that the name has stirred up the memory of someone else, who has the same or a similar-sounding name and whom one has good reason to dislike. This connection has led to the innocent person's name being forgotten; the intention to forget has, as it were, been displaced along some line of association.

Nor is the intention to avoid unpleasure the only one which can find its outlet in parapraxes. In many cases analysis reveals other purposes which have been suppressed in the particular situation and which can only make themselves felt, so to say, as background disturbances. Thus a slip of the tongue will often serve to betray opinions which the speaker wishes to conceal from his interlocutor. Slips of the tongue have been understood in this sense by various great writers and employed for this purpose in their works. The loss of precious objects often turns out to be an act of sacrifice intended to avert some expected evil; and many other superstitions too survive in educated people in the form of parapraxes. The mislaying of objects means as a rule getting rid of them; damage is done to one's possessions (ostensibly by accident) so as to make it necessary to acquire something better - and so on.

Nevertheless, in spite of the apparent triviality of these phenomena, the psycho-analytic explanation of parapraxes involves some slight modifications in our view of the world. We find that even normal people are far more frequently moved by contradictory motives than we should have expected. The number of occurrences that can be described as 'accidental' is considerably diminished. It is almost a consolation to be able to exclude the loss of objects from among the chance events of life; our blunders often turn out to be a cover for our secret intentions. But - what is more important - many serious accidents that we should otherwise have ascribed entirely to chance reveal under analysis the participation of the subject's own volition, though without its being clearly admitted by him. The distinction between a chance accident and deliberate self-destruction, which in practice is so often hard to draw, becomes even more dubious when looked at from an analytic point of view.

The explanation of parapraxes owes its theoretical value to the ease with which they can be solved and their frequency in normal people. But the success of psycho-analysis in explaining them is far surpassed in importance by a further achievement made by it, relating to another phenomenon of normal mental life. What I have in mind is the interpretation of *dreams*, which brought psycho-analysis for the first time into the conflict with official science which was to be its destiny. Medical research explains dreams as purely somatic phenomena, without meaning or significance, and regards them as the reaction of a mental organ sunk in a state of sleep to physical stimuli which partially awaken it. Psycho-analysis raises the status of dreams into that of psychical acts possessing meaning and purpose, and having a place in the subject's mental life, and thus disregards their strangeness, incoherence and absurdity. On this view somatic stimuli merely play the part of material that is worked over in the course of the construction of the dream. There is no half-way house between these two views of dreams. What argues against the physiological hypothesis is its unfruitfulness, and what may be argued in favour of the psycho-analytic one is the fact that it has translated and given a meaning to thousands of dreams and has used them to throw light on the intimate details of the human mind.

I devoted a volume published in 1900 to the important subject of dream-interpretation and have had the satisfaction of seeing the theories put forward in it confirmed and amplified by contributions from almost every worker in the field of psycho-analysis.¹ It is generally agreed that dream-interpretation is the foundation stone of psycho-analytic work and that its findings constitute the most important contribution made by psycho-analysis to psychology.

¹ *The Interpretation of Dreams* (1900a). See also my shorter essay *On Dreams* (1901a), and other writings by Rank, Stekel, Jones, Silberer, Brill, Maeder, Abraham, Ferenczi, etc.

I cannot enter here into the technique by which an interpretation of dreams is arrived at, nor can I give the grounds for the conclusions to which the psycho-analytic investigation of dreams has led. I must restrict myself to enunciating some new concepts, reporting my findings and stressing their importance for normal psychology.

Psycho-analysis, then, has demonstrated the following facts. All dreams have a meaning. Their strangeness is due to distortions that have been made in the expression of their meaning. Their absurdity is deliberate and expresses derision, ridicule and contradiction. Their incoherence is a matter of indifference for their interpretation. The dream as we remember it after waking is described by us as its 'manifest content'. In the process of interpreting this, we are led to the 'latent dream-thoughts', which lie hidden behind the manifest content and which are represented by it. These latent dream-thoughts are no longer strange, incoherent or absurd; they are completely valid constituents of our waking thought. We give the name of 'dream-work' to the process which transforms the latent dream-thoughts into the manifest content of the dream; it is this dream-work that brings about the distortion which makes the dream-thoughts unrecognizable in the content of the dream.

The dream-work is a psychological process the like of which has hitherto been unknown to psychology. It has claims upon our interest in two main directions. In the first place, it brings to our notice novel processes such as 'condensation' (of ideas) and 'displacement' (of psychical emphasis from one idea to another), processes which we have never come across at all in our waking life, or only as the basis of what are known as 'errors in thought'. In the second place, it enables us to detect the operation in the mind of a play of forces which was concealed from our conscious perception. We find that there is a 'censorship', a testing agency, at work in us, which decides whether an idea cropping up in the mind shall be allowed to reach consciousness, and which, so far as lies within its power, ruthlessly excludes anything that might produce or revive unpleasure. And it will be recalled at this point that in our analysis of parapraxes we found traces of this same intention to avoid unpleasure in remembering things and of similar conflicts between mental impulses.

A study of the dream-work forces on us irresistibly a view of mental life which appears to decide the most controversial problems of psychology. The dream-work compels us to assume the existence of an *unconscious* psychical activity which is more comprehensive and more important than the familiar activity that is linked with consciousness. (I shall have some more to say on this point when I come to discuss the *philosophical* interest of psycho-analysis.) It enables us to dissect the psychical apparatus into a number of different agencies or systems, and shows us that in the system of unconscious mental activity processes operate which are of quite another kind from those perceived in consciousness.

The dream-work has only one function - namely to maintain sleep. 'Dreams are the guardians of sleep.' The dream-*thoughts* themselves may serve the purposes of the most various mental functions. The dream-work accomplishes its task by representing a wish that arises from the dream-thoughts as fulfilled in a hallucinatory fashion.

It may safely be said that the psycho-analytic study of dreams has given us our first insight into a 'depth-psychology' whose existence had not hitherto been suspected.¹ Fundamental changes will have to be introduced into normal psychology if it is to be brought into harmony with these new findings.

It is quite impossible to exhaust the psychological interest of dream-interpretation within the limits of my present paper. Let us bear in mind that what I have so far stressed is merely that dreams have a meaning and are objects for psychological study, and let us now proceed with our consideration of the new territory which has been annexed by psychology in the domain of pathology.

¹ Psycho-analysis does not at present postulate any relation between this psychical topography and anatomical stratification or histological layers.

The psychological novelties inferred from dreams and parapraxes must be applicable as an explanation of other phenomena if we are to believe in the value of these novelties, or, indeed, in their existence. And we do in fact find that psycho-analysis has shown that the hypotheses of unconscious mental activity, of censorship and repression and of distortion and substitution, at which we have arrived from our study of these normal phenomena, also afford us a first understanding of a number of *pathological* phenomena and, as one might say, put into our hands the key to all the riddles of the psychology of the neuroses. Thus dreams are to be regarded as the normal prototypes of all psychopathological structures. Anyone who understands dreams can also grasp the psychical mechanism of the neuroses and psychoses.

Starting from dreams, the investigations of psycho-analysis have enabled it to construct a psychology of the neuroses which is being continuously built up piece by piece. But what we are here concerned with - the *psychological* interest of psycho-analysis - obliges us to enter more fully into only two sides of this far reaching subject: the evidence that many pathological phenomena which had hitherto been believed to require physiological explanations are in fact psychical acts, and the evidence that the processes which lead to abnormal consequences can be traced back to psychical motive forces.

I will illustrate the first of these theses by a few examples. Hysterical attacks have long been recognized as signs of increased emotional excitement and equated with outbreaks of affect. Charcot attempted to reduce the multiplicity of their modes of manifestation by means of descriptive formulas; Pierre Janet recognized the unconscious ideas operating behind such attacks; while psycho-analysis has shown that they are mimetic representations of scenes (whether actually experienced or only invented) with which the patient's imagination is occupied without his becoming conscious of them. The meaning of these pantomimes is concealed from the spectators by means of condensations and distortions of the acts which they represent. And this applies equally to what are described as the 'chronic' symptoms of hysterical patients. All of them are mimetic or hallucinatory representations of phantasies which unconsciously dominate the subject's emotional life and which have the meaning of fulfilments of secret and repressed wishes. The tormenting character of these symptoms is due to the internal conflict into which these patients' minds are driven by the need to combat such unconscious wishes.

In another neurotic disorder, obsessional neurosis, the patients become the victims of distressing and apparently senseless ceremonials which take the form of the rhythmical repetition of the most trivial acts (such as washing or dressing) or of carrying out meaningless injunctions or of obeying mysterious prohibitions. It was nothing less than a triumph of psycho-analytic research when it succeeded in showing that all these obsessive acts, even the most insignificant and trivial of them, have a meaning, and that they are reflections, translated into indifferent terms, of conflicts in the patients' lives, of the struggle between temptations and moral restraints - reflections of the proscribed wish itself and of the punishment and atonement which that wish incurs. In another form of the same disorder the victim suffers from tormenting ideas (obsessions) which force themselves upon him and are accompanied by affects whose character and intensity are often only quite inadequately accounted for by the terms of the obsessive ideas themselves. Analytic investigation has shown in their case that the affects are entirely justified, since they correspond to self-reproaches which are based on something that is at least *psychically* real. But the ideas to which these affects are attached are not the original ones, but have found their way into their present position by a process of displacement - by being substituted for something that has been repressed. If these displacements can be reversed, the way is open to the discovery of the repressed ideas, and the relation between affect and idea is found to be perfectly appropriate.

In another neurotic disorder, dementia praecox (paraphrenia or schizophrenia), a condition which is in fact incurable, the patient is left, in the most severe cases, in a state of apparently complete apathy. Often his sole remaining actions are certain movements and gestures which are repeated monotonously and have been given the name of 'stereotypies'. An analytic investigation of residues of this kind, made by Jung, has shown that they are the remains of perfectly significant mimetic actions, which at one time gave expression to the subject's ruling wishes. The craziest speeches and the queerest poses and attitudes adopted by these patients become intelligible and can be given a place in the chain of their mental processes if they are approached on the basis of psycho-analytic hypotheses.

Similar considerations apply to the deliria and hallucinations, as well as to the delusional systems, exhibited by various psychotic patients. Where hitherto nothing but the most freakish capriciousness has seemed to prevail, psycho-analytic research has introduced law, order and connection, or has at least allowed us to suspect their presence where its work is still incomplete. The most heterogeneous forms of mental disorder are revealed as the results of processes which are at bottom identical and which can be understood and described by means of psychological concepts. What had already been discovered in the formation of dreams is operative everywhere - psychical conflict, the repression of certain instinctual impulses which have been pushed back into the unconscious by other mental forces, reaction formations set up by the repressing forces, and substitutes constructed by the instincts which have been repressed but have not been robbed of all their energy. The accompanying processes of condensation and displacement, so familiar to us in dreams, are also to be found everywhere. The multiplicity of clinical pictures observed by psychiatrists depends upon two other things: the multiplicity of the psychical mechanisms at the disposal of the repressive process and the multiplicity of developmental dispositions which give the repressed impulses an opportunity for breaking through into substitutive structures.

Psycho-analysis points to psychology for the solution of a good half of the problems of psychiatry. It would nevertheless be a serious mistake to suppose that analysis favours or aims at a *purely* psychological view of mental disorders. It cannot overlook the fact that the other half of the problems of psychiatry are concerned with the influence of organic factors (whether mechanical, toxic or infective) on the mental apparatus. Even in the case of the mildest of these disorders, the neuroses, it makes no claim that their origin is purely psychogenic but traces their aetiology to the influence upon mental life of an unquestionably organic factor to which I shall refer later.

The number of detailed psycho-analytic findings which cannot fail to be of importance for general psychology is too great for me to enumerate them here. I will only mention two other points: psycho-analysis unhesitatingly ascribes the primacy in mental life to affective processes, and it reveals an unexpected amount of affective disturbance and blinding of the intellect in normal no less than in sick people.

PART II

THE CLAIMS OF PSYCHO-ANALYSIS TO THE INTEREST OF
THE NON-PSYCHOLOGICAL SCIENCES

(A) THE PHILOLOGICAL INTEREST OF PSYCHO-ANALYSIS

I shall no doubt be overstepping common linguistic usage in postulating an interest in psycho-analysis on the part of philologists, that is of experts in *speech*. For in what follows 'speech' must be understood not merely to mean the expression of thought in words but to include the speech of gesture and every other method, such, for instance, as writing, by which mental activity can be expressed. That being so, it may be pointed out that the interpretations made by psycho-analysis are first and foremost translations from an alien method of expression into the one which is familiar to us. When we interpret a dream we are simply translating a particular thought-content (the latent dream-thoughts) from the 'language of dreams' into our waking speech. In the course of doing so we learn the peculiarities of this dream language and it is borne in upon us that it forms part of a highly archaic system of expression. Thus, to take an instance, there is no special indication for the negative in the language of dreams. Contraries may stand for each other in the dream's content and may be represented by the same element. Or we may put it like this: concepts are still ambivalent in dream-language, and unite within themselves contrary meanings - as is the case, according to the hypotheses of philologists, in the oldest roots of historical languages.¹ Another striking feature of our dream-language is its extremely frequent use of symbols, which make us able to some extent to translate the content of dreams without reference to the associations of the individual dreamer. Our researches have not yet sufficiently elucidated the essential nature of these symbols. They are in part substitutes and analogies based upon obvious similarities; but in some of these symbols the *tertium comparationis* which is presumably present escapes our conscious knowledge. It is precisely this latter class of symbols which must probably originate from the earliest phases of linguistic development and conceptual construction. In dreams it is above all the sexual organs and sexual activities which are represented symbolically instead of directly. A philologist, Hans Sperber, of Uppsala, has only recently (1912) attempted to prove that words which originally represented sexual activities have, on the basis of analogies of this kind, undergone an extraordinarily far-reaching change in their meaning.

¹ Cf. Abel on the antithetical meaning of primal words, and my review of his paper.

If we reflect that the means of representation in dreams are principally visual images and not words, we shall see that it is even more appropriate to compare dreams with a system of writing than with a language. In fact the interpretation of dreams is completely analogous to the decipherment of an ancient pictographic script such as Egyptian hieroglyphs. In both cases there are certain elements which are not intended to be interpreted (or read, as the case may be) but are only designed to serve as 'determinatives', that is to establish the meaning of some other element. The ambiguity of various elements of dreams finds a parallel in these ancient systems of writing; and so too does the omission of various relations, which have in both cases to be supplied from the context. If this conception of the method of representation in dreams has not yet been followed up, this, as will be readily understood, must be ascribed to the fact that psycho-analysts are entirely ignorant of the attitude and knowledge with which a philologist would approach such a problem as that presented by dreams.

The language of dreams may be looked upon as the method by which unconscious mental activity expresses itself. But the unconscious speaks more than one dialect. According to the differing psychological conditions governing and distinguishing the various forms of neurosis, we find regular modifications in the way in which unconscious mental impulses are expressed. While the gesture-language of hysteria agrees on the whole with the picture-language of dreams and visions, etc., the thought-language of obsessional neurosis and of the paraphrenias (dementia praecox and paranoia) exhibits special idiomatic peculiarities which, in a number of instances, we have been able to understand and interrelate. For instance, what a hysteric expresses by vomiting an obsessional will express by painstaking protective measures against infection, while a paraphrenic will be led to complaints or suspicions that he is being poisoned. These are all of them different representations of the patient's wish to become pregnant which have been repressed into the unconscious, or of his defensive reaction against that wish.

(B) THE PHILOSOPHICAL INTEREST OF PSYCHO-ANALYSIS

Philosophy, in so far as it is built on psychology, will be unable to avoid taking the psycho-analytic contributions to psychology fully into account and reacting to this new enrichment of our knowledge just as it has to every considerable advance in the specialized sciences. In particular, the setting up of the hypothesis of unconscious mental activities must compel philosophy to decide one way or the other and, if it accepts the idea, to modify its own views on the relation of mind to body so that they may conform to the new knowledge. It is true that philosophy has repeatedly dealt with the problem of the unconscious, but, with few exceptions, philosophers have taken up one or other of the two following positions. Either their unconscious has been something mystical, something intangible and undemonstrable, whose relation to the mind has remained obscure, or they have identified the mental with the conscious and have proceeded to infer from this definition that what is unconscious cannot be mental or a subject for psychology. These opinions must be put down to the fact that philosophers have formed their judgement on the unconscious without being acquainted with the phenomena of unconscious mental activity, and therefore without any suspicion of how far unconscious phenomena resemble conscious ones or of the respects in which they differ from them. If anyone possessing that knowledge nevertheless holds to the conviction which equates the conscious and the psychical and consequently denies the unconscious the attribute of being psychical, no objection can, of course, be made except that such a distinction turns out to be highly unpractical. For it is easy to describe the unconscious and to follow its developments if it is approached from the direction of its relation to the conscious, with which it has so much in common. On the other hand, there still seems no possibility of approaching it from the direction of physical events. So that it is bound to remain a matter for psychological study.

There is yet another way in which philosophy can derive a stimulus from psycho-analysis, and that is by itself becoming a subject of psycho-analytic research. Philosophical theories and systems have been the work of a small number of men of striking individuality. In no other science does the personality of the scientific worker play anything like so large a part as in philosophy. And now for the first time psycho-analysis enables us to construct a 'psychography' of a personality. (See the sociological section below, p. 2824.) It teaches us to recognize the affective units - the complexes dependent on instincts - whose presence is to be presumed in each individual, and it introduces us to the study of the transformations and end-products arising from these instinctual forces. It reveals the relations of a person's constitutional disposition and the events of his life to the achievements open to him owing to his peculiar gifts. It can conjecture with more or less certainty from an artist's work the intimate personality that lies behind it. In the same way, psycho-analysis can indicate the subjective and individual motives behind philosophical theories which have ostensibly sprung from impartial logical work, and can draw a critic's attention to the weak spots in the system. It is not the business of psycho-analysis, however, to undertake such criticism itself, for, as may be imagined, the fact that a theory is psychologically determined does not in the least invalidate its scientific truth.

(C) THE BIOLOGICAL INTEREST OF PSYCHO-ANALYSIS

It has not been the fate of psycho-analysis to be greeted (like other young sciences) with the sympathetic encouragement of those who are interested in the advance of knowledge. For a long time it was disregarded, and when at last it could no longer be neglected it became, for emotional reasons, the object of the most violent attacks from people who had not taken the trouble to become acquainted with it. It owed this unfriendly reception to a single circumstance: for at an early stage of its researches psycho-analysis was driven to the conclusion that nervous illnesses are an expression of a disturbance of the sexual function and it was thus led to devote its attention to an investigation of that function - one which had been far too long neglected. But anyone who respects the rule that scientific judgement should not be influenced by emotional attitudes will assign a high degree of biological interest to psycho-analysis on account of these very investigations and will regard the resistances to it as actual evidence in favour of the correctness of its assertions.

Psycho-analysis has done justice to the sexual function in man by making a detailed examination of its importance in mental and practical life - an importance which has been emphasized by many creative writers and by some philosophers, but which has never been recognized by science. But in the first place it was necessary to enlarge the unduly restricted concept of sexuality, an enlargement that was justified by reference to the extensions of sexuality occurring in the so called perversions and to the behaviour of children. It turned out to be impossible to maintain any longer that childhood was asexual and was invaded for the first time by a sudden inrush of sexual impulses at the age of puberty. On the contrary, when once the blinkers of partiality and prejudice had been removed, observation had no difficulty in revealing that sexual interests and activities are present in the human child at almost every age and from the very first. The importance of this infantile sexuality is not impaired by the fact that we cannot everywhere draw a clear line between it and a child's asexual activity. It differs, however, from what is described as the 'normal' sexuality of adults. It includes the germs of all those sexual activities which in later life are sharply contrasted with normal sexual life as being perversions, and as such bound to seem incomprehensible and vicious. The normal sexuality of adults emerges from infantile sexuality by a series of developments, combinations, divisions and suppressions, which are scarcely ever achieved with ideal perfection and consequently leave behind predispositions to a retrogression of the function in the form of illness.

Infantile sexuality exhibits two other characteristics which are of importance from a biological point of view. It turns out to be put together from a number of component instincts which seem to be attached to certain regions of the body ('erotogenic zones') and some of which emerge from the beginning in pairs of opposites - instincts with an active and a passive aim. Just as in later life what is loved is not merely the object's sexual organs but his whole body, so from the very first it is not merely the genitals but many other parts of the body which are the seat of sexual excitation and respond to appropriate stimuli with sexual pleasure. This fact is closely related to the second characteristic of infantile sexuality - namely that to start with it is attached to the functions of nutrition and excretion, and, in all probability, of muscular excitation and sensory activity.

If we examine sexuality in the adult with the help of psycho-analysis, and consider the life of children in the light of the knowledge thus gained, we perceive that sexuality is not merely a function serving the purposes of reproduction, on a par with digestion, respiration, etc. It is something far more independent, which stands in contrast to all the individual's other activities and is only forced into an alliance with the individual's economy after a complicated course of development involving the imposition of numerous restrictions. Cases, theoretically quite conceivable, in which the interests of these sexual impulses fail to coincide with the self-preservation of the individual seem actually to be presented by the group of neurotic illnesses. For the final formula which psycho-analysis has arrived at on the nature of the neuroses runs thus: The primal conflict which leads to neuroses is one between the sexual instincts and those which maintain the ego. The neuroses represent a more or less partial overpowering of the ego by sexuality after the ego's attempts at suppressing sexuality have failed.

We have found it necessary to hold aloof from biological considerations during our psycho-analytic work and to refrain from using them for heuristic purposes, so that we may not be misled in our impartial judgement of the psycho-analytic facts before us. But after we have completed our psycho-analytic work we shall have to find a point of contact with biology; and we may rightly feel glad if that contact is already assured at one important point or another. The contrast between the ego instincts and the sexual instinct, to which we have been obliged to trace back the origin of the neuroses, is carried into the sphere of biology in the contrast between the instincts which serve the preservation of the individual and those which serve the survival of the species. In biology we come upon the more comprehensive conception of an immortal germ-plasm to which the different transitory individuals are attached like organs that develop successively. It is only this conception which enables us rightly to understand the part played by the sexual instinctual forces in physiology and psychology.

In spite of all our efforts to prevent biological terminology and considerations from dominating psycho-analytic work, we cannot avoid using them even in our descriptions of the phenomena that we study. We cannot help regarding the term 'instinct' as a concept on the frontier between the spheres of psychology and biology. We speak, too, of 'masculine' and 'feminine' mental attributes and impulses, although, strictly speaking, the differences between the sexes can lay claim to no special psychical characterization. What we speak of in ordinary life as 'masculine' or 'feminine' reduces itself from the point of view of psychology to the qualities of 'activity' and 'passivity' - that is, to qualities determined not by the instincts themselves but by their aims. The regular association of these 'active' and 'passive' instincts in mental life reflects the bisexuality of individuals, which is among the clinical postulates of psycho-analysis.

I shall be satisfied if these few remarks have drawn attention to the many respects in which psycho-analysis acts as an intermediary between biology and psychology.

(D) THE INTEREST OF PSYCHO-ANALYSIS FROM A DEVELOPMENTAL POINT OF VIEW

Not every analysis of psychological phenomena deserves the name of psycho-analysis. The latter implies more than the mere analysis of composite phenomena into simpler ones. It consists in tracing back one psychical structure to another which preceded it in time and out of which it developed. Medical psycho-analytic procedure was not able to eliminate a symptom until it had traced that symptom's origin and development. Thus from the very first psycho-analysis was directed towards tracing developmental processes. It began by discovering the genesis of neurotic symptoms, and was led, as time went on, to turn its attention to other psychical structures and to construct a genetic psychology which would apply to them too.

Psycho-analysis has been obliged to derive the mental life of adults from that of children, and has had to take seriously the old saying that the child is father to the man. It has traced the continuity between the infantile and adult mind, and has also noted the transformations and re-arrangements that occur in the process. In most of us there is a gap in our memories covering the first years of our childhood, of which only a few fragmentary recollections survive. Psycho-analysis may be said to have filled in this gap and to have abolished man's infantile amnesia. (See the section on 'Educational Interest' below.)

Some notable discoveries have been made in the course of this investigation of the infantile mind. Thus it has been possible to confirm, what has often already been suspected, the extraordinarily important influence exerted by the impressions of childhood (and particularly by its earliest years) on the whole course of later development. This brings us up against a psychological paradox - which for psycho-analysts alone is no paradox - that it is precisely these most important of all impressions that are not remembered in later years. Psycho-analysis has been able to establish the decisive and indestructible character of these earliest experiences in the clearest possible way in the case of sexual life. '*On revient toujours à ses premiers amours*' is sober truth. The many riddles in the sexual life of adults can only be solved if stress is laid on the infantile factors in love. Theoretical light is thrown on their influence by the consideration that an individual's first experiences in childhood do not occur only by chance but also correspond to the first activities of his innate or constitutional instinctual dispositions.

Another and far more surprising discovery has been that, in spite of all the later development that occurs in the adult, none of the infantile mental formations perish. All the wishes, instinctual impulses, modes of reaction and attitudes of childhood are still demonstrably present in maturity and in appropriate circumstances can emerge once more. They are not destroyed but merely overlaid - to use the spatial mode of description which psycho-analytic psychology has been obliged to adopt. Thus it is part of the nature of the mental past that, unlike the historic past, it is not absorbed by its derivatives; it persists (whether actually or only potentially) alongside what has proceeded from it. The proof of this assertion lies in the fact that the dreams of normal people revive their childhood characters every night and reduce their whole mental life to an infantile level. This same return to psychical infantilism ('regression') appears in the neuroses and psychoses, whose peculiarities may to a great extent be described as psychical archaisms. The strength in which the residues of infancy are still present in the mind shows us the amount of disposition to illness; that disposition may accordingly be regarded as an expression of an inhibition in development. The part of a person's psychical material which has remained infantile and has been repressed as being unserviceable constitutes the core of his unconscious. And we believe we can follow in our patients' life-histories the way in which this unconscious, held back as it is by the forces of repression, lies in wait for a chance to become active and makes use of its opportunities if the later and higher psychical structures fail to master the difficulties of real life.

In the last few years psycho-analytic writers¹ have become aware that the principle that 'ontogeny is a repetition of phylogeny' must be applicable to mental life; and this has led to a fresh extension of psycho-analytic interest.

¹ Abraham, Spielrein and Jung.

(E) THE INTEREST OF PSYCHO-ANALYSIS FROM THE POINT OF VIEW
OF THE HISTORY OF CIVILIZATION

The comparison between the childhood of individual men and the early history of societies has already proved its fruitfulness in several directions, even though the study has scarcely more than begun. In this connection the psycho-analytic mode of thought acts like a new instrument of research. The application of its hypotheses to social psychology enables us both to raise fresh problems and to see old ones in a fresh light and contribute towards their solution.

In the first place, it seems quite possible to apply the psycho-analytic views derived from dreams to products of ethnic imagination such as myths and fairy tales.¹ The need to interpret such productions has long been felt; some 'secret meaning' has been suspected to lie behind them and it has been presumed that that meaning is concealed by changes and transformations. The study made by psycho-analysis of dreams and neuroses has given it the necessary experience to enable it to guess the technical procedures that have governed these distortions. But in a number of instances it can also reveal the hidden motives which have led to this modification in the original meaning of myths. It cannot accept as the first impulse to the construction of myths a theoretical craving for finding an explanation of natural phenomena or for accounting for cult observances and usages which have become unintelligible. It looks for that impulse in the same psychical 'complexes', in the same emotional trends, which it has discovered at the base of dreams and symptoms.

A similar application of its points of view, its hypotheses and its findings has enabled psycho-analysis to throw light on the origins of our great cultural institutions - on religion, morality, justice and philosophy.² By examining the primitive psychological situations which were able to provide the motive for creations of this kind, it has been in a position to reject certain attempts at an explanation that were based on too superficial a psychology and to replace them by a more penetrating insight.

¹ Cf. Abraham, Rank and Jung.

² For some first attempts in this direction, see Jung (1912) and Freud (1912-13).

Psycho-analysis has established an intimate connection between these psychical achievements of individuals on the one hand and societies on the other by postulating one and the same dynamic source for both of them. It starts out from the basic idea that the principal function of the mental mechanism is to relieve the individual from the tensions created in him by his needs. One part of this task can be achieved by extracting satisfaction from the external world; and for this purpose it is essential to have control over the real world. But the satisfaction of another part of these needs - among them certain affective impulses - is regularly frustrated by reality. This leads to the further task of finding some other means of dealing with the unsatisfied impulses. The whole course of the history of civilization is no more than an account of the various methods adopted by mankind for 'binding' their unsatisfied wishes, which, according to changing conditions (modified, moreover, by technological advances) have been met by reality sometimes with favour and sometimes with frustration.

An investigation of primitive peoples shows mankind caught up, to begin with, in a childish belief in its own omnipotence.¹ A whole number of mental structures can thus be understood as attempts to deny whatever might disturb this feeling of omnipotence and so to prevent emotional life from being affected by reality until the latter could be better controlled and used for purposes of satisfaction. The principle of avoiding unpleasure dominates human actions until it is replaced by the better one of adaptation to the external world. *Pari passu* with men's progressive control over the world goes a development in their *Weltanschauung*, their view of the universe as a whole. They turn away more and more from their original belief in their own omnipotence, rising from an animistic phase through a religious to a scientific one. Myths, religion and morality find their place in this scheme as attempts to seek a compensation for the lack of satisfaction of human wishes.

Our knowledge of the neurotic illnesses of individuals has been of much assistance to our understanding of the great social institutions. For the neuroses themselves have turned out to be attempts to find *individual* solutions for the problems of compensating for unsatisfied wishes, while the institutions seek to provide *social* solutions for these same problems. The recession of the social factor and the predominance of the sexual one turns these neurotic solutions of the psychological problem into caricatures which are of no service except to help us in explaining such important questions.

¹ Cf. Ferenczi (1913c) and Freud (1912-13), Chapter III.

(F) THE INTEREST OF PSYCHO-ANALYSIS FROM THE POINT OF VIEW
OF THE SCIENCE OF AESTHETICS

Psycho-analysis throws a satisfactory light upon some of the problems concerning arts and artists; but others escape it entirely. In the exercising of an art it sees once again an activity intended to allay ungratified wishes - in the first place in the creative artist himself and subsequently in his audience or spectators. The motive forces of artists are the same conflicts which drive other people into neurosis and have encouraged society to construct its institutions. Whence it is that the artist derives his creative capacity is not a question for psychology. The artist's first aim is to set himself free and, by communicating his work to other people suffering from the same arrested desires, he offers them the same liberation.¹ He represents his most personal wishful phantasies as fulfilled; but they only become a work of art when they have undergone a transformation which softens what is offensive in them, conceals their personal origin and, by obeying the laws of beauty, bribes other people with a bonus of pleasure. Psycho-analysis has no difficulty in pointing out, alongside the manifest part of artistic enjoyment, another that is latent though far more potent, derived from the hidden sources of instinctual liberation. The connection between the impressions of the artist's childhood and his life-history on the one hand and his works, as reactions to those impressions, on the other is one of the most attractive subjects of analytic examination.²

For the rest, most of the problems of artistic creation and appreciation await further study, which will throw the light of analytic knowledge on them and assign them their place in the complex structure presented by the compensation for human wishes. Art is a conventionally accepted reality in which, thanks to artistic illusion, symbols and substitutes are able to provoke real emotions. Thus art constitutes a region half-way between a reality which frustrates wishes and the wish-fulfilling world of the imagination - a region in which, as it were, primitive man's strivings for omnipotence are still in full force.

¹ Cf. Rank (1907).

² Cf. Rank (1912). See also, for the application of psycho-analysis to aesthetic problems, my book on jokes (Freud, 1905c).

(G) THE SOCIOLOGICAL INTEREST OF PSYCHO-ANALYSIS

It is true that psycho-analysis has taken the individual mind as its subject, but in investigating the individual it could not avoid dealing with the emotional basis of the relation of the individual to society. It has found that the social feelings invariably contain an erotic element - an element which, if it is over-emphasized and then repressed, becomes one of the marks of a particular group of mental disorders. Psycho-analysis has recognized that in general the neuroses are asocial in their nature and that they always aim at driving the individual out of society and at replacing the safe monastic seclusion of earlier days by the isolation of illness. The intense feeling of guilt which dominates so many neuroses has been shown to be a social modification of neurotic anxiety.

On the other hand, psycho-analysis has fully demonstrated the part played by social conditions and requirements in the causation of neurosis. The forces which, operating from the ego, bring about the restriction and repression of instinct owe their origin essentially to compliance with the demands of civilization. A constitution and a set of childhood experiences which, in other cases, would inevitably lead to a neurosis will produce no such result where this compliance is absent or where these demands are not made by the social circle in which the particular individual is placed. The old assertion that the increase in nervous disorders is a product of civilization is at least a half-truth. Young people are brought into contact with the demands of civilization by upbringing and example; and if instinctual repression occurs independently of these two factors, it is a plausible hypothesis to suppose that a primaeval and prehistoric demand has at last become part of the organized and inherited endowment of mankind. A child who produces instinctual repressions spontaneously is thus merely repeating a part of the history of civilization. What is to-day an act of internal restraint was once an external one, imposed, perhaps, by the necessities of the moment; and, in the same way, what is now brought to bear upon every growing individual as an external demand of civilization may some day become an internal disposition to repression.

(H) THE EDUCATIONAL INTEREST OF PSYCHO-ANALYSIS

The overmastering interest which must be felt in psycho-analysis by the theory of education is based upon a fact which has become evident. Only someone who can feel his way into the minds of children can be capable of educating them; and we grown-up people cannot understand children because we no longer understand our own childhood. Our infantile amnesia proves that we have grown estranged from our childhood. Psycho-analysis has brought to light the wishes, the thought structures and the developmental processes of childhood. All earlier attempts in this direction have been in the highest degree incomplete and misleading because they have entirely overlooked the inestimably important factor of sexuality in its physical and mental manifestations. The incredulous astonishment which meets the most certainly established findings of psycho-analysis on the subject of childhood - the Oedipus complex, self-love (or 'narcissism'), the disposition to perversions, anal erotism, sexual curiosity - is a measure of the gulf which separates our mental life, our judgements of value and, indeed, our processes of thought from those of even normal children.

When educators have become familiar with the findings of psycho-analysis, it will be easier for them to reconcile themselves to certain phases of infantile development and they will, among other things, not be in danger of over-estimating the importance of the socially unserviceable or perverse instinctual impulses which emerge in children. On the contrary they will refrain from any attempt at forcibly suppressing such impulses, when they learn that efforts of this kind often produce no less undesirable results than the alternative, which is so much dreaded by educators, of giving free play to children's naughtiness. The forcible suppression of strong instincts by external means never has the effect in a child of these instincts being extinguished or brought under control; it leads to repression, which establishes a predisposition to later nervous illness. Psycho-analysis has frequent opportunities of observing the part played by inopportune and undiscerning severity of upbringing in the production of neuroses, or the price, in loss of efficiency and of capacity for enjoyment, which has to be paid for the normality upon which the educator insists. And psycho-analysis can also show what precious contributions to the formation of character are made by these asocial and perverse instincts in the child, if they are not subjected to repression but are diverted from their original aims to more valuable ones by the process known as 'sublimation'. Our highest virtues have grown up, as reaction formations and sublimations, out of our worst dispositions. Education should scrupulously refrain from burying these precious springs of action and should restrict itself to encouraging the processes by which these energies are led along safe paths. Whatever we can expect in the way of prophylaxis against neurosis in the individual lies in the hands of a psycho-analytically enlightened education.¹

¹ See the writings of the Zurich pastor, Dr. Oskar Pfister.

It has not been my aim in my present paper to lay before a scientifically orientated public an account of the compass and content of psycho-analysis or of its hypotheses, problems and findings. My purpose will have been fulfilled if I have made clear the many spheres of knowledge in which psycho-analysis is of interest and the numerous links which it has begun to forge between them.

OBSERVATIONS AND EXAMPLES FROM ANALYTIC PRACTICE
(1913)

Intentionally left blank

OBSERVATIONS AND EXAMPLES FROM ANALYTIC PRACTICE

The collection of short contributions, of which we here present a first instalment, calls for a few introductory words. The cases of illness which come under a psycho-analyst's observation are of course of unequal value in adding to his knowledge. There are some on which he has to bring to bear all that he knows and from which he learns nothing; and there are others which show him what he already knows in a particularly clearly marked manner and in exceptionally revealing isolation, so that he is indebted to them not only for a confirmation but for an extension of his knowledge. We are justified in supposing that the psychical processes which we wish to study are no different in the first class of cases from what they are in the second, but we shall choose to describe them as they occur in the favourable and clear examples afforded by the latter. Similarly, the theory of evolution assumes that in the animal kingdom the segmentation of the egg proceeds in the same manner in those cases where a high degree of pigmentation is present and which are unfavourable for observation, as it does in those cases where the object of study is transparent and poorly pigmented and which are on that account selected for observation.

But the numerous apt examples, which, in the course of an analyst's daily work, bring him a confirmation of what he already knows, are for the most part lost to view, since their collection into a larger whole often involves long delays. There is therefore some advantage in the provision of a framework within which observations and examples of this kind can be published and made generally known without waiting to be worked over from a more generalized point of view.

Under the heading which is here introduced space will be offered for material of this kind. Communications should be kept as concise as possible. The different items are arranged in no particular order.

(1)

DREAM WITH AN UNRECOGNIZED PRECIPITATING CAUSE

A good sleeper awoke one morning at a summer resort in the Tyrol, knowing that he had had a dream that the Pope was dead. He could think of no explanation of it. During the morning of the same day his wife said to him: 'Did you hear the dreadful noise the bells made early this morning?' He had not heard it but had evidently dreamt about it. The interpretation which his dream gave of the bells was his revenge on the pious Tyrolese. According to the newspapers the Pope was slightly indisposed at that time.

(2)

THE TIME OF DAY IN DREAMS

This very often stands for the age of the dreamer at some particular period in his childhood. In one dream a quarter past five in the morning meant the age of five years and three months, which was significant, since that was the dreamer's age at the time of the birth of his younger brother. - Many similar examples.

(3)

REPRESENTATION OF AGES IN DREAMS

A woman dreamt that she was walking with two little girls whose ages differed by fifteen months. She was unable to recall any family of her acquaintance to whom this would apply. It occurred to her that both the children represented herself and that the dream was reminding her that the two traumatic events of her childhood were separated from each other by fifteen months ($3\frac{1}{2}$ and $4\frac{3}{4}$).

(4)

POSITION WHEN WAKING FROM A DREAM

A woman dreamt that she was lying on her back and pressing the soles of her feet against those of another woman. The analysis made it seem probable that she was thinking of scenes of romping which she had substituted for the memory of an observation of sexual intercourse. When she woke up she noticed that, on the contrary, she had been lying on her stomach with her arms crossed, and had thus been imitating the position of a man and his embrace.

(9)

TWO ROOMS AND ONE ROOM

He had a dream in which he saw two familiar rooms which had been made into one.

Nothing factual. The dream pointed to the female genitals and the anus, which, as a child, he had regarded as one area, the 'bottom' (in accordance with the infantile 'cloaca theory'), while he now knows that there are two separate cavities and orifices. A reversed representation.

(10)

OVERCOAT AS A SYMBOL

In women's dreams an overcoat [German '*Mantel*'] is unquestionably shown to be a symbol for a man. Linguistic assonance may perhaps play some part in this.

(13)

DISGRACED FEET (SHOES)

After several days of resistance the patient reported that she had felt very much snubbed because a young man whom she met regularly near the doctor's house, and who used as a rule to look at her admiringly, had on the last occasion looked contemptuously at her feet. In fact she had no reason to be ashamed of her feet. She produced the explanation herself after admitting that she had regarded the young man as the doctor's son, who thus (by way of the transference) stood for her elder brother. There now followed a memory of having been in the habit of accompanying her brother to the lavatory when she was about five years old and of watching him micturate. She was overcome with envy at not being able to do it in the same way as he did and one day tried to copy him (envy for the penis). But in doing so she wetted her shoes and got very angry when her brother teased her about it. For a long time afterwards her anger recurred whenever her brother looked contemptuously at her shoes with the object of reminding her of her misfortune. She added that this experience had determined her later behaviour at school. If she was unsuccessful in anything at the first attempt she could never bring herself to try again, so that in many subjects she failed completely. This is a good example of the way in which sexual life acts as a model and influences character.

(15)

SELF-CRITICISM BY NEUROTICS

It is always a striking thing and deserves special notice when a neurotic is in the habit of speaking ill of himself, expressing a low opinion of himself, and so on. As in the case of self-reproaches, it is often possible to explain it by supposing that he is identifying himself with someone else. But in one patient the attendant circumstances during the session necessitated another explanation of behaviour of this kind. A young lady, who was never tired of declaring that she had very little intelligence, was without gifts, etc., was only trying to indicate by this that she had great physical beauty, and was concealing this boast behind her self-criticism. Nor was a reference to the harmful effects of masturbation - a reference which is to be expected in all such cases - absent in this one.

(19)

CONSIDERATIONS OF REPRESENTABILITY

A man dreamt that he was pulling a woman out from behind a bed: i.e. he was giving her preference.¹ - He (an officer) was sitting at a table opposite the Emperor: i.e. he was putting himself in opposition to the Emperor (his father). In both these cases the dreamer himself gave the translation.

(20)

DREAMS ABOUT DEAD PEOPLE

If someone dreams of talking to dead people or associating with them, and so on, this often has the meaning of his own death. But if he remembers in his dream that the person in question is dead, the dreamer is repudiating the fact that it signifies his own death.

(21)

FRAGMENTARY DREAMS

These often contain only the symbols relating to the subject of the dream. For instance, here is a dream that occurred in a context of homosexual impulses: he was going for a walk somewhere with a friend . . . (indistinct) . . . balloons.

(22)

APPEARANCE IN THE DREAM OF THE SYMPTOMS OF THE ILLNESS

The symptoms of the illness (anxiety, etc.), when they appear in a dream, seem generally speaking to mean: 'I fell ill because of this (i.e. in connection with the earlier elements of the dream).' Such dreams, accordingly, correspond to a continuation of the analysis in the dream.

¹ [The point depends on a similarity between the German word for 'pulling out' ('*hervorziehen*') and 'giving preference' ('*vorziehen*').]

FAUSSE RECONNAISSANCE ('DÉJÀ RACONTÉ')
IN PSYCHO-ANALYTIC TREATMENT
(1914)

Intentionally left blank

FAUSSE RECONNAISSANCE ('DÉJÀ RACONTÉ') IN PSYCHO-ANALYTIC TREATMENT

It not infrequently happens in the course of an analytic treatment that the patient, after reporting some fact that he has remembered, will go on to say: '*But I've told you that already*' - while the analyst himself feels sure that this is the first time he has heard the story. If the patient is contradicted upon the point, he will often protest with energy that he is perfectly certain he is right, that he is ready to swear to it, and so on; while the analyst's own conviction that what he has heard is new to him will become correspondingly stronger. To try to decide the dispute by shouting the patient down or by outvying him in protestations would be a most unpsychological proceeding. It is familiar ground that a sense of conviction of the accuracy of one's memory has no objective value; and, since one of the two persons concerned must necessarily be in the wrong, it may just as well be the physician as the patient who has fallen a victim to a paramnesia. The analyst will admit as much to the patient, will break off the argument, and will postpone a settlement of the point until some later occasion.

In a minority of cases the analyst himself will then recollect that he has already heard the piece of information under dispute, and will at the same time discover the subjective, and often far-fetched, reason which led to this temporary forgetfulness. But in the great majority of cases it is the patient who turns out to have been mistaken; and he can be brought to recognize the fact. The explanation of this frequent occurrence appears to be that the patient really had an *intention* of giving this information, that once or even several times he actually made some remark leading up to it, but that he was then prevented by resistance from carrying out his purpose, and afterwards confused a recollection of his intention with a recollection of its performance.

Leaving on one side any cases in which there may still be some element of doubt, I will now bring forward a few others which are of special theoretical interest. With certain people it happens, and may even happen repeatedly, that they cling with particular obstinacy to the assertion that they have already told the analyst this or that, when the nature of the circumstances and of the information in question makes it quite impossible that they can be right. For what they claim to have told the analyst already and what they claim to recognize as something old, which must be familiar to the analyst as well, turn out to be memories of the greatest importance to the analysis - confirmatory facts for which the analyst has long been waiting, or solutions which wind up a whole section of the work and which he would certainly have made the basis of an exhaustive discussion. In the face of these considerations the patient himself soon admits that his recollection must have deceived him, though he is unable to account for its definite character.

The phenomenon presented by the patient in cases like this deserves to be called a '*fausse reconnaissance*', and is completely analogous to what occurs in certain other cases and has been described as a '*déjà vu*'. In these other cases the subject has a spontaneous feeling such as 'I've been in this situation before', or 'I've been through all this already', without ever being in a position to confirm his conviction by discovering an actual recollection of the previous occasion. This latter phenomenon, as is well known, has provoked a large number of attempts at explanation, which can be divided roughly into two groups.¹ One class of explanation looks upon the feeling which constitutes the phenomenon as deserving of credence, and assumes that something really has been remembered - the only question being what. The second and far larger class of explanation includes those which maintain, on the contrary, that what we have to deal with is an illusory memory, and that the problem is to discover how this paramnesic error can have arisen. This latter group comprises many widely different hypotheses. There is, for instance, the ancient view, ascribed to Pythagoras, that the phenomenon of *déjà vu* is evidence of the subject having had a former life; again, there is the hypothesis based on anatomy (put forward by Wigan in 1860) to the effect that the phenomenon is based on an absence of simultaneity in the functioning of the two cerebral hemispheres; and finally there are the purely psychological theories, supported by the majority of more recent authorities, which regard the *déjà vu* as an indication of an apperceptive weakness, and assign the responsibility for its occurrence to such causes as fatigue, exhaustion and distraction.

¹ One of the most recent bibliographies of the subject is to be found in Havelock Ellis (1911).

In 1904 Grasset put forward an explanation of the *déjà vu* which must be reckoned as one of the group which 'believes' in the phenomenon. He was of opinion that the phenomenon indicates that at some earlier time there has been an *unconscious* perception, which only now makes its way into consciousness under the influence of a new and similar impression. Several other authorities have agreed with this view, and have maintained that the basis of the phenomenon is the recollection of something that has been dreamed and then forgotten. In both cases it would be a question of the activation of an unconscious impression.

In 1907, in the second edition of my *Psychopathology of Everyday Life*, I proposed an exactly similar explanation for this form of apparent paramnesia without mentioning Grasset's paper or knowing of its existence. By way of excuse I may remark that I arrived at my conclusion as the result of a psycho-analytic investigation which I was able to make of an example of *déjà vu* in a female patient; it was extremely clear, although it had taken place some 28 years earlier. I shall not reproduce the little analysis in this place. It showed that the situation in which the *déjà vu* occurred was really calculated to revive the memory of an earlier experience of the patient's. The patient, who was at that time a twelve year-old child, was visiting a family in which there was a brother who was seriously ill and at the point of death; while her own brother had been in a similarly dangerous condition a few months earlier. But with the earlier of these two similar events there had been associated a phantasy that was incapable of entering consciousness - namely, a wish that her brother should die. Consequently, the analogy between the two cases could no become conscious. And the perception of it was replaced by the phenomenon of 'having been through it all before', the identity being displaced from the really common element on to the locality.

The name '*déjà vu*' is, as we know, applied to a whole class of analogous phenomena, such as the '*déjà entendu*', the '*déjà éprouve*' and the '*déjà senti*'. The case which I am now about to report, as a single instance out of many similar ones, consists of a '*déjà raconte*'; and it could be traced back to an unconscious resolution which was never carried out.

A patient said to me in the course of his associations: 'When I was playing in the garden with a knife (that was when I was five years old) and cut through my little finger - oh, I only *thought* it was cut through - but I've told you about that already.'

I assured him that I had no recollection of anything of the kind. He insisted with increasing conviction that it was impossible he could be mistaken. I finally put an end to the argument in the manner I have described above and asked him in any case to repeat the story. Then we should see where we were.

'When I was five years old, I was playing in the garden near my nurse, and was carving with my pocket-knife in the bark of one of the walnut-trees that come into my dream as well.¹ Suddenly, to my unspeakable terror, I noticed that I had cut through the little finger of my (right or left?) hand, so that it was only hanging on by its skin. I felt no pain, but great fear. I did not venture to say anything to my nurse, who was only a few paces distant, but I sank down on the nearest seat and sat there incapable of casting another glance at my finger. At last I calmed down, took a look at the finger, and saw that it was entirely uninjured.'

¹ Cf. 'The Occurrence in Dreams of Material from Fairy Tales'. In telling the story again on a later occasion he made the following correction: 'I don't believe I was cutting the tree. That was a confusion with another recollection, which must also have been hallucinatorily falsified, of having made a cut in a tree with my knife and of *blood* having come out of the tree.'

We soon agreed that, in spite of what he had thought, he could not have told me the story of this vision or hallucination before. He was very well aware that I could not have failed to exploit such evidence as this of his having had a *fear of castration* at the age of five. The episode broke down his resistance to assuming the existence of a castration complex; but he raised the question: 'Why did I feel so certain of having told you this recollection before?'

It then occurred to both of us that repeatedly and in various connections he had brought out the following trivial recollection, and each time without our deriving my profit from it:

'Once when my uncle went away on a journey he asked me and my sister what we should like him to bring us back. My sister asked for a book, and I asked for a pocket-knife.' We now understood that this association which had emerged months before had in reality been a screen memory for the repressed recollection, and had been an attempt (rendered abortive by resistance) at telling the story of his imagined loss of his little finger - an unmistakable equivalent for his penis. The knife which his uncle did in fact bring him back was, as he clearly remembered, the same one that made its appearance in the episode which had been suppressed for so long.

It seems unnecessary to add anything in the way of an interpretation of this little occurrence, so far as it throws light upon the phenomenon of '*fausse reconnaissance*'. As regards the subject-matter of the patient's vision, I may remark that, particularly in relation to the castration complex, similar hallucinatory falsifications are of not infrequent occurrence, and that they can just as easily serve the purpose of correcting unwelcome perceptions.

In 1911 a man of university education, residing in a university town in Germany, with whom I am unacquainted and whose age is unknown to me, put the following notes upon his childhood at my disposal.

'In the course of reading your study on Leonardo da Vinci, I was moved to internal dissent by the observations near the beginning of Chapter III. Your assertion that male children are dominated by an interest in their own genitals provoked me to make a counter-assertion to the effect that "if that is the general rule, I at all events am an exception to it". I then went on to read the passage that follows with the utmost amazement, such amazement as one feels when one comes across a fact of an entirely novel character. In the midst of my amazement a recollection occurred to me which showed me, to my own surprise, that the fact could not be by any means so novel as it had seemed. For, at the time at which I was passing through the period of "infantile sexual researches", a lucky chance gave me an opportunity of inspecting the female genitals in a little girl of my own age, and in doing so *I quite clearly observed a penis of the same kind as my own*. Soon afterwards I was plunged into fresh confusion by the sight of some female statues and nudes; and in order to get over this "scientific" discrepancy I devised the following experiment. By pressing my thighs together I succeeded in making my genitals disappear between them; and I was glad to find that in that way all differences between my own appearance and that of a female nude could be got rid of. Evidently, I thought to myself, the genitals have been made to disappear in a similar way in female nudes.

'At this point another recollection occurred to me, which has always been of the greatest importance to me, in so far as it is *one* of the three recollections which constitute all that I can remember of my mother, who died when I was very young. I remember seeing my mother standing in front of the washing-stand and cleaning the glasses and washing-basin, while I was playing in the same room and committing some misdemeanour. As a punishment my hand was soundly slapped. Then to my very great terror I saw my little finger fall off; and in fact it fell into the pail. Knowing that my mother was angry, I did not venture to say anything; but my terror grew still more intense when I saw the pail carried off soon afterwards by the servant girl. For a long time I was convinced that I had lost a finger - up to the time, I believe, at which I learnt to count.

'I have often tried to interpret this recollection, which, as I have already mentioned, has always been of the greatest importance to me on account of its connection with my mother; but none of my interpretations has satisfied me. It is only now, after reading your book, that I begin to have a suspicion of a simple and satisfying answer to the conundrum.'

There is another kind of *fausse reconnaissance* which not infrequently makes its appearance at the close of a treatment, much to the physician's satisfaction. After he has succeeded in forcing the repressed event (whether it was of a real or of a psychical nature) upon the patient's acceptance in the teeth of all resistances, and has succeeded, as it were, in rehabilitating it - the patient may say: '*Now I feel as though I had known it all the time.*' With this the work of the analysis has been completed.

THE MOSES OF MICHELANGELO
(1914)

Intentionally left blank

THE MOSES OF MICHELANGELO

I may say at once that I am no connoisseur in art, but simply a layman. I have often observed that the subject-matter of works of art has a stronger attraction for me than their formal and technical qualities, though to the artist their value lies first and foremost in these latter. I am unable rightly to appreciate many of the methods used and the effects obtained in art. I state this so as to secure the reader's indulgence for the attempt I propose to make here.

Nevertheless, works of art do exercise a powerful effect on me, especially those of literature and sculpture, less often of painting. This has occasioned me, when I have been contemplating such things, to spend a long time before them trying to apprehend them in my own way, i.e. to explain to myself what their effect is due to. Wherever I cannot do this, as for instance with music, I am almost incapable of obtaining any pleasure. Some rationalistic, or perhaps analytic, turn of mind in me rebels against being moved by a thing without knowing why I am thus affected and what it is that affects me.

This has brought me to recognize the apparently paradoxical fact that precisely some of the grandest and most overwhelming creations of art are still unsolved riddles to our understanding. We admire them, we feel overawed by them, but we are unable to say what they represent to us. I am not sufficiently well-read to know whether this fact has already been remarked upon; possibly, indeed, some writer on aesthetics has discovered that this state of intellectual bewilderment is a necessary condition when a work of art is to achieve its greatest effects. It would be only with the greatest reluctance that I could bring myself to believe in any such necessity.

I do not mean that connoisseurs and lovers of art find no words with which to praise such objects to us. They are eloquent enough, it seems to me. But usually in the presence of a great work of art each says something different from the other; and none of them says anything that solves the problem for the unpretending admirer. In my opinion, what grips us so powerfully can only be the artist's *intention*, in so far as he has succeeded in expressing it in his work and in getting us to understand it. I realize that this cannot be merely a matter of *intellectual* comprehension; what he aims at is to awaken in us the same, emotional attitude, the same mental constellation as that which in him produced the impetus to create. But why should the artist's intention not be capable of being communicated and comprehended in *words*, like any other fact of mental life? Perhaps where great works of art are concerned this would never be possible without the application of psycho-analysis. The product itself after all must admit of such an analysis, if it really is an effective expression of the intentions and emotional activities of the artist. To discover his intention, though, I must first find out the meaning and content of what is represented in his work; I must, in other words, be able to *interpret* it. It is possible, therefore, that a work of art of this kind needs interpretation, and that until I have accomplished that interpretation I cannot come to know why I have been so powerfully affected. I even venture to hope that the effect of the work will undergo no diminution after we have succeeded in thus analysing it.

Let us consider Shakespeare's masterpiece, *Hamlet*, a play, now over three centuries old.¹ I have followed the literature of psycho-analysis closely, and I accept its claim that it was not until the material of the tragedy had been traced back by psycho-analysis to the Oedipus theme that the mystery of its effect was at last explained. But before this was done, what a mass of differing and contradictory interpretative attempts, what a variety of opinions about the hero's character and the dramatist's intentions! Does Shakespeare claim our sympathies on behalf of a sick man, or of an ineffectual weakling, or of an idealist who is merely too good for the real world? And how many of these interpretations leave us cold! - so cold that they do nothing to explain the effect of the play and rather incline us to the view that its magical appeal rests solely upon the impressive thoughts in it and the splendour of its language. And yet, do not those very endeavours speak for the fact that we feel the need of discovering in it some source of power beyond them alone?

¹ Perhaps first performed in 1602.

Another of these inscrutable and wonderful works of art is the marble statue of Moses, by Michelangelo, in the Church of S. Pietro in Vincoli in Rome. As we know, it was only a fragment of the gigantic tomb which the artist was to have erected for the powerful Pope Julius II.¹ It always delights me to read an appreciative sentence about this statue, such as that it is 'the crown of modern sculpture' (Grimm). For no piece of statuary has ever made a stronger impression on me than this. How often have I mounted the steep steps from the unlovely Corso Cavour to the lonely piazza where the deserted church stands, and have essayed to support the angry scorn of the hero's glance! Sometimes I have crept cautiously out of the half-gloom of the interior as though I myself belonged to the mob upon whom his eye is turned - the mob which can hold fast no conviction, which has neither faith nor patience, and which rejoices when it has regained its illusory idols.

But why do I call this statue inscrutable? There is not the slightest doubt that it represents Moses, the Law-giver of the Jews, holding the Tables of the Ten Commandments. That much is certain, but that is all. As recently as 1912 an art critic, Max Sauerlandt, has said, 'No other work of art in the world has been judged so diversely as the Moses with the head of Pan. The mere interpretation of the figure has given rise to completely opposed views. . . .' Basing myself on an essay published only five years ago,² I will first set out the doubts which are associated with this figure of Moses; and it will not be difficult to show that behind them lies concealed all that is most essential and valuable for the comprehension of this work of art.

¹ According to Henry Thode, the statue was made between the years 1512 and 1516.

² Thode (1908).

I

The Moses of Michelangelo is represented as seated; his body faces forward, his head with its mighty beard looks to the left, his right foot rests on the ground and his left leg is raised so that only the toes touch the ground. His right arm links the Tables of the Law with a portion of his beard; his left arm lies in his lap. Were I to give a more detailed description of his attitude, I should have to anticipate what I want to say later on. The descriptions of the figure given by various writers are, by the way, curiously inapt. What has not been understood has been inaccurately perceived or reproduced. Grimm says that the right hand, 'under whose arm the Tables rest, grasps his beard'. So also Lübke: 'Profoundly shaken, he rasps with his right hand his magnificent, flowing beard . . .'; and Springer: 'Moses presses one (the left) hand against his body, and thrusts the other, as though unconsciously, into the mighty locks of his beard.' Justi thinks that the fingers of his (right) hand are playing with his beard, 'as an agitated man nowadays might play with his watch-chain.' Müntz, too, lays stress on this playing with the beard. Thode speaks of the 'calm, firm posture of the right hand upon the Tables resting against his side'. He does not recognize any sign of excitement even in the right hand, as Justi and also Boito do. 'The hand remains grasping his beard, in the position it was in before the Titan turned his head to one side.' Jakob Burckhardt complains that 'the celebrated left arm has no other function in reality than to press his beard to his body'.

If mere descriptions do not agree we shall not be surprised to find a divergence of view as to the meaning of various features of the statue. In my opinion we cannot better characterize the facial expression of Moses than in the words of Thode, who reads in it 'a mixture of wrath, pain and contempt', - 'wrath in his threatening contracted brows, pain in his glance, and contempt in his protruded under-lip and in the down-drawn corners of his mouth'. But other admirers must have seen with other eyes. Thus Dupaty says, 'His august brow seems to be but a transparent veil only half concealing his great mind'.¹ Lübke, on the other hand, declares that 'one would look in vain in that head for an expression of higher intelligence; his down-drawn brow speaks of nothing but a capacity for infinite wrath and an all-compelling energy'. Guillaume (1876) differs still more widely in his interpretation of the expression of the face. He finds no emotion in it 'only a proud simplicity, an inspired dignity, a living faith. The eye of Moses looks into the future, he foresees the lasting survival of his people, the immutability of his law.' Similarly, to Müntz, 'the eyes of Moses rove far beyond the race of men. They are turned towards those mysteries which he alone has descried.' To Steinmann, indeed, this Moses is 'no longer the stern Lawgiver, no longer the terrible enemy of sin, armed with the wrath of Jehovah, but the royal priest, whom age may not approach, beneficent and prophetic, with the reflection of eternity upon his brow, taking his last farewell of his people'.

¹ Quoted by Thode, *ibid.*, 197.

There have even been some for whom the Moses of Michelangelo had nothing at all to say, and who are honest enough to admit it. Thus a critic in the *Quarterly Revue* of 1858: 'There is an absence of meaning in the general conception, which precludes the idea of a self-sufficing whole. . . .' And we are astonished to learn that there are yet others who find nothing to admire in the Moses, but who revolt against it and complain of the brutality of the figure and the animal cast of the head.

Has then the master-hand indeed traced such a vague or ambiguous script in the stone, that so many different readings of it are possible?

Another question, however, arises, which covers the first one. Did Michelangelo intend to create a 'timeless study of character and mood' in this Moses, or did he portray him at a particular moment of his life and, if so, at a highly significant one? The majority of judges have decided in the latter sense and are able to tell us what episode in his life it is which the artist has immortalized in stone. It is the descent from Mount Sinai, where Moses has received the Tables from God, and it is the moment when he perceives that the people have meanwhile made themselves a Golden Calf and are dancing around it and rejoicing. This is the scene upon which his eyes are turned, this is the spectacle which calls out the feelings depicted in his countenance - feelings which in the next instant will launch his great frame into violent action. Michelangelo has chosen this last moment of hesitation, of calm before the storm, for his representation. In the next instant Moses will spring to his feet - his left foot is already raised from the ground - dash the Tables to the earth, and let loose his rage upon his faithless people.

Once more many individual differences of opinion exist among those who support this interpretation.

Burckhardt writes: 'Moses seems to be shown at that moment at which he catches sight of the worship of the Golden Calf, and is springing to his feet. His form is animated by the inception of a mighty movement and the physical strength with which he is endowed causes us to await it with fear and trembling.'

Lübke says: 'It is as if at this moment his flashing eye were perceiving the sin of the worship of the Golden Calf and a mighty inward movement were running through his whole frame. Profoundly shaken, he grasps with his right hand his magnificent, flowing beard, as though to master his actions for one instant longer, only for the explosion of his wrath to burst out with more shattering force the next.'

Springer agrees with this view, but not without mentioning one misgiving, which will engage our attention later in this paper. He says, 'Burning with energy and zeal, it is with difficulty that the hero subdues his inward emotion. . . . We are thus involuntarily reminded of a dramatic situation and are brought to believe that Moses is represented at the moment at which he sees the people of Israel worshipping the Golden Calf and is about to start up in wrath. Such an impression, it is true, is not easy to reconcile with the artist's real intention, since the figure of Moses, like the other five seated figures on the upper part of the Papal tomb, is meant primarily to have a decorative effect. But it testifies very convincingly to the vitality and individuality portrayed in the figure of Moses.'

One or two writers, without actually accepting the Golden Calf theory, do nevertheless agree on its main point, namely, that Moses is just about to spring to his feet and take action.

According to Grimm, 'The form' (of Moses) 'is filled with a majesty, a self-assurance, a feeling that all the thunders of heaven are at his command, and that yet he is holding himself in check before loosing them, waiting to see whether the foes whom he means to annihilate will dare to attack him. He sits there as if on the point of starting to his feet, his proud head carried high on his shoulders; the hand under whose arm the Tables rest grasps his beard, which falls in heavy waves over his breast, his nostrils distended and his lips shaped as though words were trembling upon them.'

Heath Wilson declares that Moses' attention has been excited, and he is about to leap to his feet, but is still hesitating; and that his glance of mingled scorn and indignation is still capable of changing into one of compassion.

Wölfflin speaks of 'inhibited movement'. The cause of this inhibition, he says, lies in the will of the man himself; it is the last moment of self-control before he lets himself go and leaps to his feet.

Justi has gone the furthest of all in his interpretation of the statue as Moses in the act of perceiving the Golden Calf, and he has pointed out details hitherto unobserved in it and worked them into his hypothesis. He directs our attention to the position of the two Tables - an unusual one, for they are about to slip down on to the stone seat. 'He' (Moses) 'might therefore be looking in the direction from which the clamour was coming with an expression of evil foreboding, or it might be the actual sight of the abomination which has dealt him a stunning blow. Quivering with horror and pain he has sunk down.'¹ He has sojourned on the mountain forty days and nights and he is weary. A horror, a great turn of fortune, a crime, even happiness itself, can be perceived in a single moment, but not grasped in its essence, its depths or its consequences. For an instant it seems to Moses that his work is destroyed and he despairs utterly of his people. In such moments the inner emotions betray themselves involuntarily in small movements. He lets the Tables slip from his right hand on to the stone seat; they have come to rest on their corner there and are pressed by his forearm against the side of his body. His hand, however, comes in contact with his breast and beard and thus, by the turning of the head to the spectator's right, it draws the beard to the left and breaks the symmetry of that masculine adornment. It looks as though his fingers were playing with his beard as an agitated man nowadays might play with his watch-chain. His left hand is buried in his garment over the lower part of his body - in the Old Testament the viscera are the seat of the emotions - but the left leg is already drawn back and the right put forward; in the next instant he will leap up, his mental energy will be transposed from feeling into action, his right arm will move, the Tables will fall to the ground, and the shameful trespass will be expiated in torrents of blood. . . . 'This is not yet the moment of tension of an act. Pain of mind still dominates him and almost paralyses him.'

¹ It should be remarked that the careful arrangement of the mantle over the knees of the sitting figure invalidates this first part of Justi's view. On the contrary, this would lead us to suppose that Moses is represented as sitting there in calm repose until he is startled by some sudden perception.

Knapp takes the same view, except that he does not introduce the doubtful point at the beginning of the description, and carries the idea of the slipping Tables further. 'He who just now was alone with his God is distracted by earthly sounds. He hears a noise; the noise of singing and dancing wakes him from his dream; he turns his eyes and his head in the direction of the clamour. In one instant fear, rage and unbridled passion traverse his huge frame. The Tables begin to slip down, and will fall to the ground and break when he leaps to his feet and hurls the angry thunder of his words into the midst of his backsliding people. . . . This is the moment of highest tension which is chosen. . . .' Knapp, therefore, emphasizes the element of preparation for action, and disagrees with the view that what is being represented is an initial inhibition due to an overmastering agitation.

It cannot be denied that there is something extraordinarily attractive about attempts at an interpretation of the kind made by Justi and Knapp. This is because they do not stop short at the general effect of the figure, but are based on separate features in it; these we usually fail to notice, being overcome by the total impression of the statue and as it were paralysed by it. The marked turn of the head and eyes to the left, whereas the body faces forwards, supports the view that the resting Moses has suddenly seen something on that side to rivet his attention. His lifted foot can hardly mean anything else but that he is preparing to spring up;¹ and the very unusual way in which the Tables are held (for they are most sacred objects and are not to be brought into the composition like any ordinary accessory) is fully accounted for if we suppose they have slipped down as a result of the agitation of their bearer and will fall to the ground. According to this view we should believe that the statue represents a special and important moment in the life of Moses, and we should be left in no doubt of what that moment is.

But two remarks of Thode's deprive us of the knowledge we thought to have gained. This critic says that to his eye the Tables are not slipping down but are 'firmly lodged'. He notes the 'calm, firm pose of the right hand upon the resting Tables'. If we look for ourselves we cannot but admit unreservedly that Thode is right. The Tables are firmly placed and in no danger of slipping. Moses' right hand supports them or is supported by them. This does not explain the position in which they are held, it is true, but that position cannot be used in favour of the interpretation of Justi and others.

The second observation is still more final. Thode reminds us that 'this statue was planned as one of six, and is intended to be seated. Both facts contradict the view that Michelangelo meant to record a particular historical moment. For, as regards the first consideration, the plan of representing a row of seated figures as types of human beings - as the *vita activa* and the *vita contemplativa* - excluded a representation of a particular historic episode. And, as regards the second, the representation of a seated posture - a posture necessitated by the artistic conception of the whole monument - contradicts the nature of that episode, namely, the descent of Moses from Mount Sinai into the camp.'

¹ Although the left foot of the reposeful seated figure of Giuliano in the Medici Chapel is similarly raised from the ground.

If we accept Thode's objection we shall find that we can add to its weight. The figure of Moses was to have decorated the base of the tomb together with five other statues (or according to a later sketch, with three). Its immediate counterpart was to have been a figure of Paul. One other pair, representing the *vita activa* and the *vita contemplativa* in the shape of Leah and Rachel - standing, it is true - has been executed on the tomb as it still exists in its sadly aborted form. The Moses thus forms part of a whole and we cannot imagine that the figure was meant to arouse an expectation in the spectator that it was on the point of leaping up from its seat and rushing away to create a disturbance on its own account. If the other figures were not also represented as about to take violent action - and it seems very improbable that they were - then it would create a very bad impression for one of them to give us the illusion that it was going to leave its place and its companions, in fact to abandon its role in the general scheme. Such an intention would have a chaotic effect and we could not charge a great artist with it unless the facts drove us to it. A figure in the act of instant departure would be utterly at variance with the state of mind which the tomb is meant to induce in us.

The figure of Moses, therefore, cannot be supposed to be springing to his feet; he must be allowed to remain as he is in sublime repose like the other figures and like the proposed statue of the Pope (which was not, however, executed by Michelangelo himself). But then the statue we see before us cannot be that of a man filled with wrath, of Moses when he came down from Mount Sinai and found his people faithless and threw down the Holy Tables so that they were broken. And, indeed, I can recollect my own disillusionment when, during my, first visits to San Pietro in Vincoli, I used to sit down in front of the statue in the expectation that I should now see how it would start up on its raised foot, dash the Tables of the Law to the ground and let fly its wrath. Nothing of the kind happened. Instead, the stone image became more and more transfixed, an almost oppressively solemn calm emanated from it, and I was obliged to realize that something was represented here that could stay without change; that this Moses would remain sitting like this in his wrath for ever.

But if we have to abandon our interpretation of the statue as showing Moses just before his outburst of wrath at the sight of the Golden Calf, we have no alternative but to accept one of the hypotheses which regard it as a study of character. Thode's view seems to be the least arbitrary and to have the closest reference to the meaning of its movements. He says, 'Here, as always, he is concerned with representing a certain type of character. He creates the image of a passionate leader of mankind who, conscious of his divine mission as Lawgiver, meets the uncomprehending opposition of men. The only means of representing a man of action of this kind was to accentuate the power of his will, and this was done by a rendering of movement pervading the whole of his apparent quiet, as we see in the turn of his head, the tension of his muscles and the position of his left foot. These are the same distinguishing marks that we find again in the *vir activus* of the Medici Chapel in Florence. This general character of the figure is further heightened by laying stress on the conflict which is bound to arise between such a reforming genius and the rest of mankind. Emotions of anger, contempt and pain are typified in him. Without them it would not have been possible to portray the nature of a superman of this kind. Michelangelo has created, not a historical figure, but a character-type, embodying an inexhaustible inner force which tames the recalcitrant world; and he has given a form not only to the Biblical narrative of Moses, but to his own inner experiences, and to his impressions both of the individuality of Julius himself, and also, I believe, of the underlying springs of Savonarola's perpetual conflicts.'

This view may be brought into connection with Knackfuss's remark that the great secret of the effect produced by the Moses lies in the artistic contrast between the inward fire and the outward calm of his bearing.

For myself, I see nothing to object to in Thode's explanation; but I feel the lack of something in it. Perhaps it is the need to discover a closer parallel between the state of mind of the hero as expressed in his attitude, and the contrast above-mentioned between his 'outward' calm and 'inward' emotion.

II

Long before I had any opportunity of hearing about psycho-analysis, I learnt that a Russian art-connoisseur, Ivan Lermolieff,¹ had caused a revolution in the art galleries of Europe by questioning the authorship of many pictures, showing how to distinguish copies from originals with certainty, and constructing hypothetical artists for those works whose former supposed authorship had been discredited. He achieved this by insisting that attention should be diverted from the general impression and main features of a picture, and by laying stress on the significance of minor details, of things like the drawing of the fingernails, of the lobe of an ear, of halos and such unconsidered trifles which the copyist neglects to imitate and yet which every artist executes in his own characteristic way. I was then greatly interested to learn that the Russian pseudonym concealed the identity of an Italian physician called Morelli, who died in 1891 with the rank of Senator of the Kingdom of Italy. It seems to me that his method of inquiry is closely related to the technique of psycho-analysis. It, too, is accustomed to divine secret and concealed things from despised or unnoticed features, from the rubbish-heap, as it were, of our observations.

Now in two places in the figure of Moses there are certain details which have hitherto not only escaped notice but, in fact, have not even been properly described. These are the attitude of his right hand and the position of the two Tables of the Law. We may say that this hand forms a very singular, unnatural link, and one which calls for explanation, between the Tables and the wrathful hero's beard. He has been described as running his fingers through his beard and playing with its locks, while the outer edge of his hand rests on the Tables. But this is plainly not so. It is worth while examining more closely what those fingers of the right hand are doing, and describing more minutely the mighty beard with which they are in contact.²

¹ His first essays were published in German between 1874 and 1876.

² Cf. the illustration.

We now quite clearly perceive the following things: the thumb of the hand is concealed and the index finger alone is in effective contact with the beard. It is pressed so deeply against the soft masses of hair that they bulge out beyond it both above and below, that is, both towards the head and towards the abdomen. The other three fingers are propped upon the wall of his chest and are bent at the upper joints; they are barely touched by the extreme right-hand lock of the beard which falls past them. They have, as it were, withdrawn from the beard. It is therefore not correct to say that the right hand is playing with the beard or plunged in it; the simple truth is that the index finger is laid over a part of the beard and makes a deep trough in it. It cannot be denied that to press one's beard with one finger is an extraordinary gesture and one not easy to understand.

The much-admired beard of Moses flows from his cheeks, chin and upper lip in a number of waving strands which are kept distinct from one another all the way down. One of the strands on his extreme right, growing from the cheek, falls down to the inward-pressing index finger, by which it is retained. We may assume that it resumes its course between that finger and the concealed thumb. The corresponding strand on his left side falls practically unimpeded far down over his breast. What has received the most unusual treatment is the thick mass of hair on the inside of this latter strand, the part between it and the middle line. It is not suffered to follow the turn of the head to the left; it is forced to roll over loosely and form part of a kind of scroll which lies across and over the strands on the inner right side of the beard. This is because it is held fast by the pressure of the right index finger, although it grows from the left side of the face and is, in fact, the main portion of the whole left side of the beard. Thus, the main mass of the beard is thrown to the right of the figure, whereas the head is sharply turned to the left. At the place where the right index finger is pressed in, a kind of whorl of hairs is formed; strands of hair coming from the left lie over strands coming from the right, both caught in by that despotic finger. It is only beyond this place that the masses of hair, deflected from their course, flow freely once more, and now they fall vertically until their ends are gathered up in Moses' left hand as it lies open on his lap.

I have no illusions as to the clarity of my description, and venture no opinion whether the sculptor really does invite us to solve the riddle of that knot in the beard of his statue. But apart from this, the fact remains that the pressure of the *right* index finger affects mainly the strands of hair from the *left* side; and that this oblique hold prevents the beard from accompanying the turn of the head and eyes to the left. Now we may be allowed to ask what this arrangement means and to what motives it owes its existence. If it was indeed considerations of linear and spatial design which caused the sculptor to draw the downward-streaming wealth of hair across to the right of the figure which is looking to its left, how strangely unsuitable as a means does the pressure of a single finger appear to be! And what man who, for some reason or other, has drawn his beard over to the other side, would take it into his head to hold down the one half across the other by the pressure of one finger? Yet may not these minute particulars mean nothing in reality, and may we not be racking our brains about things which were of no moment to their creator?

But let us proceed on the assumption that even these details have significance. There is a solution which will remove our difficulties and afford a glimpse of a new meaning. If the *left* side of Moses' beard lies under the pressure of his *right* finger, we may perhaps take this pose as the last stage of some connection between his right hand and the left half of his beard, a connection which was a much more intimate one at some moment before that chosen for representation. Perhaps his hand had seized his beard with far more energy, had reached across to its left edge, and, in returning to that position in which the statue shows it, had been followed by a part of his beard which now testifies to the movement which has just taken place. The loop of the beard would thus be an indication of the path taken by this hand.

Thus we shall have inferred that there had been a retreating motion of the right hand. This one assumption necessarily brings others with it. In imagination we complete the scene of which this movement, established by the evidence of the beard, is a part; and we are brought back quite naturally to the hypothesis according to which the resting Moses is startled by the clamour of the people and the spectacle of the Golden Calf. He was sitting there calmly, we will suppose, his head with its flowing beard facing forward, and his hand in all probability not near it at all. Suddenly the clamour strikes his ear; he turns his head and eyes in the direction from which the disturbance comes, sees the scene and takes it in. Now wrath and indignation lay hold of him; and he would fain leap up and punish the wrongdoers, annihilate them. His rage, distant as yet from its object, is meanwhile directed in a gesture against his own body. His impatient hand, ready to act, clutches at his beard which has moved with the turn of his head, and presses it between his thumb and palm in the iron grasp of his closing fingers. It is a gesture whose power and vehemence remind us of other creations of Michelangelo's. But now an alteration takes place, as yet we do not know how or why. The hand that had been put forward and had sunk into his beard is hastily withdrawn and unclasped, and the fingers let go their hold; but so deeply have they been plunged in that in their withdrawal they drag a great piece of the left side of the beard across to the right, and this piece remains lodged over the hair of the right under the weight of one finger, the longest and uppermost one of the hand. And this new position, which can only be understood with reference to the former one, is now retained.

It is time now to pause and reflect. We have assumed that the right hand was, to begin with, away from the beard; that then it reached across to the left of the figure in a moment of great emotional tension and seized the beard; and that it was finally drawn back again, taking a part of the beard with it. We have disposed of this right hand as though we had the free use of it. But may we do this? Is the hand indeed so free? Must it not hold or support the Tables? Are not such mimetic evolutions as these prohibited by its important function? And furthermore, what could have occasioned its withdrawal if the motive which made it leave its original position was such a strong one?

Here are indeed fresh difficulties. It is undeniable that the right hand is responsible for the Tables; and also that we have no motive to account for the withdrawal we have ascribed to it. But what if both difficulties could be solved together, and if then and then only they presented a clear and connected sequence of events? What if it is precisely something which is happening to the Tables that explains the movements of the hand?

If we look at the drawing in Fig. 4 we shall see that the Tables present one or two notable features hitherto not deemed worthy of remark. It has been said that the right hand rests upon the Tables; or again that it supports them. And we can see at once that the two apposed, rectangular tablets stand on one corner. If we look closer we shall notice that the lower edge is a different shape from the upper one, which is obliquely inclined forward.

Fig. 1

Fig. 2

Fig. 3

Fig. 4

The upper edge is straight, whereas the lower one has a protuberance like a horn on the part nearest to us, and the Tables touch the stone seat precisely with this protuberance. What can be the meaning of this detail? It can hardly be doubted that this projection is meant to mark the actual top side of the Tablets, as regards the writing. It is only the top edge of rectangular tablets of this kind that is curved or notched. Thus we see that the Tables are upside-down. This is a singular way to treat such sacred objects. They are stood

The Moses Of Michelangelo

on their heads and practically balanced on one corner. What consideration of form could have led Michelangelo to put them in such a position? Or was this detail as well of no importance to the artist?

¹ Which, by the way, is quite incorrectly reproduced in a large plaster cast in the collection of the Vienna Academy of Fine Arts.

We begin to suspect that the Tables too have arrived at their present position as the result of a previous movement; that this movement was a consequence of the change of place of the right hand that we have postulated, and in its turn compelled that hand to make its subsequent retreat. The movements of the hand and of the Tables can be co-ordinated in this way: at first the figure of Moses, while it was still sitting quietly, carried the Tables perpendicularly under its right arm. Its right hand grasped their lower edge and found a hold in the projection on their front part. (The fact that this made them easier to carry sufficiently accounts for the upside-down position in which the Tables were held.) Then came the moment when Moses' calm was broken by the disturbance. He turned his head in its direction, and when he saw the spectacle he lifted his foot preparatory to starting up, let go the Tables with his hand and plunged it to the left and upwards into his beard, as though to turn his violence against his own body. The Tables were now consigned to the pressure of his arm, which had to squeeze them against his side. But this support was not sufficient and the Tables began to slip in a forward and downward direction. The upper edge, which had been held horizontally, now began to face forwards and downwards; and the lower edge, deprived of its stay, was nearing the stone seat with its front corner. Another instant and the Tables would have pivoted upon this new point of support, have hit the ground with the upper edge foremost, and been shattered to pieces. It is *to prevent this* that the right hand retreated, let go the beard, a part of which was drawn back with it unintentionally, came against the upper edge of the Tables in time and held them near the hind corner, which had now come uppermost. Thus the singularly constrained air of the whole - beard, hand and tilted Tables - can be traced to that one passionate movement of the hand and its natural consequences. If we wish to reverse the effects of those stormy movements, we must raise the upper front corner of the Tables and push it back, thus lifting their lower front corner (the one with the protuberance) from the stone seat; and then lower the right hand and bring it under the now horizontal lower edge of the Tables.

I have procured from the hand of an artist three drawings to illustrate my meaning. Fig. 3 reproduces the statue as it actually is; Figs. 1 and 2 represent the preceding stages according to my hypothesis - the first that of calm, the second that of highest tension, in which the figure is preparing to spring up and has abandoned its hold of the Tables, so that these are beginning to slip down. Now it is remarkable how the two postures in the imaginary drawings vindicate the incorrect descriptions of earlier writers. Gondivi, a contemporary of Michelangelo's, says: 'Moses, the captain and leader of the Hebrews, is seated in the attitude of a contemplative sage, holding the Tables of the Law under his right arm, and leaning his chin on his left hand(!), as one who is weary and full of care.' No such attitude is to be seen in Michelangelo's statue, but it describes almost exactly the view on which the first drawing is based. Lübke writes, together with other critics: 'Profoundly shaken, he grasps with his right hand his magnificent, flowing beard.' This is incorrect if we look at the reproduction of the actual statue, but it is true of the second sketch (Fig. 2). Justi and Knapp have observed, as we have seen, that the Tables are about to slip down and are in danger of being broken. Thode set them right and showed that the Tables were securely held by the right hand; yet they would have been correct if they had been describing not the statue itself but the middle stage of our reconstructed action. It almost seems as if they had emancipated themselves from the visual image of the statue and had unconsciously begun an analysis of the motive forces behind it, and that that analysis had led them to make the same claim as we have done more consciously and more explicitly.

III

We may now, I believe, permit ourselves to reap the fruits of our endeavours. We have seen how many of those who have felt the influence of this statue have been impelled to interpret it as representing Moses agitated by the spectacle of his people fallen from grace and dancing round an idol. But this interpretation had to be given up, for it made us expect to see him spring up in the next moment, break the Tables and accomplish the work of vengeance. Such a conception, however, would fail to harmonize with the design of making this figure, together with three (or five) more seated figures, a part of the tomb of Julius II. We may now take up again the abandoned interpretation, for the Moses we have reconstructed will neither leap up nor cast the Tables from him. What we see before us is not the inception of a violent action but the remains of a movement that has already taken place. In his first transport of fury, Moses desired to act, to spring up and take vengeance and forget the Tables; but he has overcome the temptation, and he will now remain seated and still, in his frozen wrath and in his pain mingled with contempt. Nor will he throw away the Tables so that they will break on the stones, for it is on their especial account that he has controlled his anger; it was to preserve them that he kept his passion in check. In giving way to his rage and indignation, he had to neglect the Tables, and the hand which upheld them was withdrawn. They began to slide down and were in danger of being broken. This brought him to himself. He remembered his mission and for its sake renounced an indulgence of his feelings. His hand returned and saved the unsupported Tables before they had actually fallen to the ground. In this attitude he remained immobilized, and in this attitude Michelangelo has portrayed him as the guardian of the tomb.

As our eyes travel down it the figure exhibits three distinct emotional strata. The lines of the face reflect the feelings which have won the ascendancy; the middle of the figure shows the traces of suppressed movement; and the foot still retains the attitude of the projected action. It is as though the controlling influence had proceeded downwards from above. No mention has been made so far of the left arm, and it seems to claim a share in our interpretation. The hand is laid in the lap in a mild gesture and holds as though in a caress the end of the flowing beard. It seems as if it is meant to counteract the violence with which the other hand had misused the beard a few moments ago.

But here it will be objected that after all this is not the Moses of the Bible. For that Moses did actually fall into a fit of rage and did throw away the Tables and break them. This Moses must be a quite different man, a new Moses of the artist's conception; so that Michelangelo must have had the presumption to emend the sacred text and to falsify the character of that holy man. Can we think him capable of a boldness which might almost be said to approach an act of blasphemy?

The passage in the Holy Scriptures which describes Moses' action at the scene of the Golden Calf is as follows: (Exodus xxxii. 7) 'And the Lord said unto Moses, Go, get thee down; for thy people, which thou broughtest out of the land of Egypt, have corrupted themselves: (8) They have turned aside quickly out of the way which I commanded them: they have made them a molten calf, and have worshipped it, and have sacrificed thereunto, and said, These be thy gods, O Israel, which brought thee up out of the land of Egypt. (9) And the Lord said unto Moses, I have seen this people, and, behold, it is a stiff-necked people: (10) Now therefore let me alone, that my wrath may wax hot against them, and that I may consume them; and I will make of thee a great nation. (11) And Moses besought the Lord his God, and said, Lord, why doth thy wrath wax hot against thy people, which thou hast brought forth out of the land of Egypt with great power, and with a mighty hand? . . .

'(14) And the Lord repented of the evil which he thought to do unto his people. (15) And Moses turned, and went down from the mount, and the two tables of the testimony were in his hand: the tables were written on both their sides; on the one side and on the other were they written. (16) And the tables were the work of God, and the writing was the writing of God, graven upon the tables. (17) And when Joshua heard the noise of the people as they shouted, he said unto Moses, There is a noise of war in the camp. (18) And he said, It is not the voice of them that shout for mastery, neither is it the voice of them that cry for being overcome; but the noise of them that sing do I hear. (19) And it came to pass, as soon as he came nigh unto the camp, that he saw the calf, and the dancing: and Moses' anger waxed hot, and he cast the tables out of his hands, and brake them beneath the mount. (20) And he took the calf which they had made, and burnt it in the fire, and ground it to powder, and strawed it upon the water, and made the children of Israel drink of it. . . .

'(30) And it came to pass on the morrow, that Moses said unto the people, Ye have sinned a great sin: and now I will go up unto the Lord; peradventure I shall make an atonement for your sin. (31) And Moses returned unto the Lord, and said, Oh! this people have sinned a great sin, and have made them gods of gold! (32) Yet now, if thou wilt forgive their sin-; and if not, blot me, I pray thee, out of thy book which thou hast written. (33) And the Lord said unto Moses, Whosoever hath sinned against me, him will I blot out of my book. (34) Therefore now go, lead the people unto the place of which I have spoken unto thee. Behold, mine Angel shall go before thee: nevertheless, in the day when I visit, I will visit their sin upon them. (35) And the Lord plagued the people, because they made the calf which Aaron made.'

It is impossible to read the above passage in the light of modern criticism of the Bible without finding evidence that it has been clumsily put together from various sources. In verse 8 the Lord Himself tells Moses that his people have fallen away and made themselves an idol; and Moses intercedes for the wrongdoers. And yet he speaks to Joshua as though he knew nothing of this (18), and is suddenly aroused to wrath as he sees the scene of the worshipping of the Golden Calf (19). In verse 14 he has already gained a pardon from God for his erring people, yet in verse 31 he returns into the mountains to implore this forgiveness, tells God about his people's sin and is assured of the postponement of the punishment. Verse 35 speaks of a visitation of his people by the Lord about which nothing more is told us; whereas the verses 20-30 describe the punishment which Moses himself dealt out. It is well known that the historical parts of the Bible, dealing with the Exodus, are crowded with still more glaring incongruities and contradictions.

The age of the Renaissance had naturally no such critical attitude towards the text of the Bible, but had to accept it as a consistent whole, with the result that the passage in question was not a very good subject for representation. According to the Scriptures Moses was already instructed about the idolatry of his people and had ranged himself on the side of mildness and forgiveness; nevertheless, when he saw the Golden Calf and the dancing crowd, he was overcome by a sudden frenzy of rage. It would therefore not surprise us to find that the artist, in depicting the reaction of his hero to that painful surprise, had deviated from the text from inner motives. Moreover, such deviations from the scriptural text on a much slighter pretext were by no means unusual or disallowed to artists. A celebrated picture by Parmigiano possessed by his native town depicts Moses sitting on the top of a mountain and dashing the Tables to the ground, although the Bible expressly says that he broke them 'beneath the mount'. Even the representation of a seated Moses finds no support in the text and seems rather to bear out those critics who maintain that Michelangelo's statue is not meant to record any particular moment in the prophet's life.

More important than his infidelity to the text of the Scriptures is the alteration which Michelangelo has, in our supposition, made in the character of Moses. The Moses of legend and tradition had a hasty temper and was subject to fits of passion. It was in a transport of divine wrath of this kind that he slew an Egyptian who was maltreating an Israelite, and had to flee out of the land into the wilderness; and it was in a similar passion that he broke the Tables of the Law, inscribed by God Himself. Tradition, in recording such a characteristic, is unbiased, and preserves the impression of a great personality who once lived. But Michelangelo has placed a different Moses on the tomb of the Pope, one superior to the historical or traditional Moses. He has modified the theme of the broken Tables; he does not let Moses break them in his wrath, but makes him be influenced by the danger that they will be broken and makes him calm that wrath, or at any rate prevent it from becoming an act. In this way he has added something new and more than human to the figure of Moses; so that the giant frame with its tremendous physical power becomes only a concrete expression of the highest mental achievement that is possible in a man, that of struggling successfully against an inward passion for the sake of a cause to which he has devoted himself.

We have now completed our interpretation of Michelangelo's statue, though it can still be asked what motives prompted the sculptor to select the figure of Moses, and a so greatly altered Moses, as an adornment for the tomb of Julius II. In the opinion of many these motives are to be found in the character of the Pope and in Michelangelo's relations with him. Julius II was akin to Michelangelo in this, that he attempted to realize great and mighty ends, and especially designs on a grand scale. He was a man of action and he had a definite purpose, which was to unite Italy under the Papal supremacy. He desired to bring about single-handed what was not to happen for several centuries, and then only through the conjunction of many alien forces; and he worked alone, with impatience, in the short span of sovereignty allowed him, and used violent means. He could appreciate Michelangelo as a man of his own kind, but he often made him smart under his sudden anger and his utter lack of consideration for others. The artist felt the same violent force of will in himself, and, as the more introspective thinker, may have had a premonition of the failure to which they were both doomed. And so he carved his Moses on the Pope's tomb, not without a reproach against the dead pontiff, as a warning to himself, thus, in self-criticism, rising superior to his own nature.

IV

In 1863 an Englishman, Watkiss Lloyd, devoted a little book to the Moses of Michelangelo. I succeeded in getting hold of this short essay of forty-six pages, and read it with mixed feelings. I once more had an opportunity of experiencing in myself what unworthy and puerile motives enter into our thoughts and acts even in a serious cause. My first feeling was one of regret that the author should have anticipated so much of my thought, which seemed precious to me because it was the result of my own efforts; and it was only in the second instance that I was able to get pleasure from its unexpected confirmation of my opinion. Our views, however, diverge on one very important point.

Lloyd remarks in the first place that the usual descriptions of the figure are incorrect, and that Moses is not in the act of rising¹ - that the right hand is not grasping the beard, but that the index-finger alone is resting upon it.² Lloyd also recognizes, and this is much more important, that the attitude portrayed can only be explained by postulating a foregoing one, which is not represented, and that the drawing of the left lock of the beard across to the right signifies that the right hand and the left side of the beard have at a previous stage been in closer and more natural contact. But he suggests another way of reconstructing the earlier contact which must necessarily be assumed. According to him, it was not the hand which had been plunged into the beard, but the beard which had been where the hand now is. We must, he says, imagine that just before the sudden interruption the head of the statue was turned far round to its right over the hand which, then as now, was holding the Tables of the Law. The pressure (of the Tables) against the palm of the hand caused the fingers to open naturally beneath the flowing locks of the beard, and the sudden turn of the head to the other side resulted in a part of the beard being detained for an instant by the motionless hand and forming the loop of hair which is to be looked on as a mark of the course it has taken - its 'wake', to use Lloyd's own word.

¹ 'But he is not rising or preparing to rise; the bust is fully upright, not thrown forward for the alteration of balance preparatory for such a movement. . . .' (Lloyd, 1863, 10).

² 'Such a description is altogether erroneous; the fillets of the beard are detained by the right hand but they are not held, nor grasped, enclosed or taken hold of. They are even detained but momentarily - momentarily engaged, they are on the point of being free for disengagement' (ibid., 11).

In rejecting the other possibility, that of the right hand having previously been in contact with the left side of the beard, Lloyd has allowed himself to be influenced by a consideration which shows how near he came to our interpretation. He says that it was not possible for the prophet, even in very great agitation, to have put out his hand to draw his beard across to the right. For in that case his fingers would have been in an entirely different position; and, moreover, such a movement would have allowed the Tables to slip down, since they are only supported by the pressure of the right arm - unless, in Moses' endeavour to save them at the last moment, we think of them as being 'clutched by a gesture so awkward that to imagine it is profanation'.

It is easy to see what the writer has overlooked. He has correctly interpreted the anomalies of the beard as indicating a preceding movement, but he has omitted to apply the same explanation to the no less unnatural details in the position of the Tables. He examines only the data connected with the beard and not those connected with the Tables, whose position he assumes to be the original one. In this way he closes the door to a conception like ours which, by examining certain insignificant details, has arrived at an unexpected interpretation of the meaning and aim of the figure as a whole.

But what if both of us have strayed on to a wrong path? What if we have taken too serious and profound a view of details which were nothing to the artist, details which he had introduced quite arbitrarily or for some purely formal reasons with no hidden intention behind? What if we have shared the fate of so many interpreters who have thought they saw quite clearly things which the artist did not intend either consciously or unconsciously? I cannot tell. I cannot say whether it is reasonable to credit Michelangelo - an artist in whose works there is so much thought striving for expression - with such an elementary want of precision, and especially whether this can be assumed in regard to the striking and singular features of the statue under discussion. And finally we may be allowed to point out, in all modesty, that the artist is no less responsible than his interpreters for the obscurity which surrounds his work. In his creations Michelangelo has often enough gone to the utmost limit of what is expressible in art; and perhaps in his statue of Moses he has not completely succeeded, if his purpose was to make the passage of a violent gust of passion visible in the signs left behind it in the ensuing calm.

STATUETTE OF MOSES
Attributed to Nicholas of Verdun

POSTSCRIPT
(1927)

Several years after the publication of my paper on the Moses of Michelangelo, which appeared anonymously in *Imago* in 1914, Dr. Ernest Jones very kindly sent me a copy of the April number of the *Burlington Magazine* of 1921 (Vol. XXXVIII), which could not fail to turn my interest once more to the interpretation of the statue which I had originally suggested. This number contains (pp. 157-66) a short article by H. P. Mitchell on two bronzes of the twelfth century, now in the Ashmolean Museum at Oxford, which are attributed to an outstanding artist of that day, Nicholas of Verdun. We possess other works by the same hand in Tournay, Arras and Klosterneuburg, near Vienna; his masterpiece is considered to be the Shrine of the Three Kings in Cologne.

One of the two statuettes described by Mitchell, which is just over 9 inches high, is identifiable beyond all doubt as a Moses, because of the two Tables of the Law which he holds in his hand. This Moses, too, is represented as seated, enveloped in a flowing robe. His face is expressive of strong passion, mixed, perhaps, with grief; and his hand grasps his long beard and presses its strands between palm and thumb as in a vice. He is, that is to say, making the very gesture which I postulated in Fig. 2 of my former paper as a preliminary stage of the attitude into which Michelangelo has cast him.

A glance at the accompanying illustration will show the main difference between the two compositions, which are separated from each other by an interval of more than three centuries. The Moses of the Lorraine artist is holding the Tables by their top edge with his left hand, resting them on his knee. If we were to transfer them to the other side of his body and put them under his right arm we should have established the preliminary posture of Michelangelo's Moses. If my view of the thrusting of the hand into the beard is right, then the Moses of the year 1180 shows us an instant during his storm of feeling, whilst the statue in S. Pietro in Vincoli depicts the calm when the storm is over.

In my opinion this new piece of evidence increases the probability that the interpretation which I attempted in 1914 was a correct one. Perhaps some connoisseur of art will be able to bridge the gulf in time between the Moses of Nicholas of Verdun and the Moses of the Master of the Italian Renaissance by telling us where examples of representations of Moses belonging to the intervening period are to be found.

SOME REFLECTIONS ON SCHOOLBOY PSYCHOLOGY
(1914)

Intentionally left blank

SOME REFLECTIONS ON SCHOOLBOY PSYCHOLOGY

It gives you a queer feeling if, late in life, you are ordered once again to write a school essay. But you obey automatically, like the old soldier who, at the word 'Attention!', cannot help dropping whatever he may have in his hands and who finds his little fingers pressed along the seams of his trousers. It is strange how readily you obey the orders, as though nothing in particular had happened in the last half-century. But in fact you have grown old in the interval, you are on the eve of your sixtieth birthday, and your physical feelings, as well as your mirror, show unmistakably how far your life's candle is burnt down.

As little as ten years ago, perhaps, you may have had moments at which you suddenly felt quite young again. As you walked through the streets of Vienna - already a grey-beard, and weighed down by all the cares of family life - you might come unexpectedly on some well-preserved, elderly gentleman and would greet him humbly almost, because you had recognized him as one of your former schoolmasters. But afterwards you would stop and reflect: 'Was that really he? or only some one deceptively like him? How youthful he looks! And how old you yourself have grown! How old can he be to-day? Can it be possible that the men who used to stand for us as types of adulthood were really so little older than we were?'

At such moments as these, I used to find, the present time seemed to sink into obscurity and the years between ten and eighteen would rise from the corners of my memory, with all their guesses and illusions, their painful distortions and heartening successes - my first glimpses of an extinct civilization (which in my case was to bring me as much consolation as anything else in the struggles of life), my first contacts with the sciences, among which it seemed open to me to choose to which of them I should dedicate what were no doubt my inestimable services. And I seem to remember that through the whole of this time there ran a premonition of a task ahead, till it found open expression in my school-leaving essay as a wish that I might during the course of my life contribute something to our human knowledge.

Later I became a physician - or a psychologist, rather - and was able to create a new psychological discipline, something that is known as 'psycho-analysis', which is followed to-day with excited interest, and is greeted with praise and blame, by physicians and enquirers in neighbouring, and in distant, foreign lands - but least of all, of course, in our own country.

As a psycho-analyst I am bound to be concerned more with emotional than intellectual processes, with unconscious than with conscious mental life. My emotion at meeting my old schoolmaster warns me to make a first admission: it is hard to decide whether what affected us more and was of greater importance to us was our concern with the sciences that we were taught or with the personalities of our teachers. It is true, at least, that this second concern was a perpetual undercurrent in all of us, and that in many of us the path to the sciences led only through our teachers. Some of us stopped half-way along that path, and for a few - why not admit as much? - it was on that account blocked for good and all.

We courted them or turned our backs on them, we imagined sympathies and antipathies in them which probably had no existence, we studied their characters and on theirs we formed or misformed our own. They called up our fiercest opposition and forced us to complete submission; we peered into their little weaknesses, and took pride in their excellences, their knowledge and their justice. At bottom we felt a great affection for them if they gave us any ground for it, though I cannot tell how many of them were aware of this. But it cannot be denied that our position in regard to them was a quite remarkable one and one which may well have had its inconvenience for those concerned. We were from the very first equally inclined to love and to hate them, to criticize and respect them. Psycho-analysis has given the name of 'ambivalence' to this readiness to contradictory attitudes, and it has no difficulty in pointing to the source of ambivalent feelings of such a kind.

For psycho-analysis has taught us that the individual's emotional attitudes to other people, which are of such extreme importance to his later behaviour, are already established at an unexpectedly early age. The nature and quality of the human child's relations to people of his own and the opposite sex have already been laid down in the first six years of his life. He may afterwards develop and transform them in certain directions but he can no longer get rid of them. The people to whom he is in this way fixed are his parents and his brothers and sisters. All those whom he gets to know later become substitute figures for these first objects of his feelings. (We should perhaps add to his parents any other people, such as nurses, who cared for him in his infancy.) These substitute figures can be classified from his point of view according as they are derived from what we call the 'imagos' of his father, his mother, his brothers and sisters, and so on. His later acquaintances are thus obliged to take over a kind of emotional heritage; they encounter sympathies and antipathies to the production of which they themselves have contributed little. All of his later choices of friendship and love follow upon the basis of the memory-traces left behind by these first prototypes.

Of all the imagos of a childhood which, as a rule, is no longer remembered, none is more important for a youth or a man than that of his father. Organic necessity introduces into a man's relation to his father an emotional ambivalence which we have found most strikingly expressed in the Greek myth of King Oedipus. A little boy is bound to love and admire his father, who seems to him the most powerful, the kindest and the wisest creature in the world. God himself is after all only an exaltation of this picture of a father as he is represented in the mind of early childhood. But soon the other side of this emotional relationship emerges. One's father is recognized as the paramount disturber of one's instinctual life; he becomes a model not only to imitate but also to get rid of, in order to take his place. Thenceforward affectionate and hostile impulses towards him persist side by side, often to the end of one's life, without either of them being able to do away with the other. It is in this existence of contrary feelings side by side that lies the essential character of what we call emotional ambivalence.

In the second half of childhood a change sets in in the boy's relation to his father - a change whose importance cannot be exaggerated. From his nursery the boy begins to cast his eyes upon the world outside. And he cannot fail now to make discoveries which undermine his original high opinion of his father and which expedite his detachment from his first ideal. He finds that his father is no longer the mightiest, wisest and richest of beings; he grows dissatisfied with him, he learns to criticize him and to estimate his place in society; and then, as a rule, he makes him pay heavily for the disappointment that has been caused by him. Everything that is hopeful, as well as everything that is unwelcome, in the new generation is determined by this detachment from the father.

It is in this phase of a youth's development that he comes into contact with his teachers. So that we can now understand our relation to our schoolmasters. These men, not all of whom were in fact fathers themselves, became our substitute fathers. That was why, even though they were still quite young, they struck us as so mature and so unattainably adult. We transferred on to them the respect and expectations attaching to the omniscient father of our childhood, and we then began to treat them as we treated our fathers at home. We confronted them with the ambivalence that we had acquired in our own families and with its help we struggled with them as we had been in the habit of struggling with our fathers in the flesh. Unless we take into account our nurseries and our family homes, our behaviour to our schoolmasters would be not only incomprehensible but inexcusable.

As schoolboys we had other and scarcely less important experiences with the successors of our brothers and sisters - our schoolfellows - but these must be described elsewhere. In a commemoration of the jubilee of our school it is on the masters that our thoughts must rest.

ON THE HISTORY OF THE PSYCHO-ANALYTIC MOVEMENT
(1914)

Intentionally left blank

ON THE HISTORY OF THE PSYCHO-ANALYTIC MOVEMENT

*Fluctuat nec mergitur*¹

(On the coat of arms of the City of Paris)

I

No one need be surprised at the subjective character of the contribution I propose to make here to the history of the psycho-analytic movement, nor need anyone wonder at the part I play in it. For psycho-analysis is my creation; for ten years I was the only person who concerned himself with it, and all the dissatisfaction which the new phenomenon aroused in my contemporaries has been poured out in the form of criticisms on my head. Although it is a long time now since I was the only psycho-analyst, I consider myself justified in maintaining that even to-day no one can know better than I do what psycho-analysis is, how it differs from other ways of investigating the life of the mind, and precisely what should be called psycho-analysis and what would better be described by some other name. In thus repudiating what seems to me a cool act of usurpation, I am indirectly informing the readers of this *Jahrbuch* the events that have led to the changes in its editorship and format.

¹ ['It is tossed by the waves, but does not sink'.]

In 1909, in the lecture-room of an American university, I had my first opportunity of speaking in public about psycho-analysis.¹ The occasion was a momentous one for my work, and moved by this thought I then declared that it was not I who had brought psycho-analysis into existence: the credit for this was due to someone else, to Josef Breuer, whose work had been done at a time when I was still a student engaged in passing my examinations (1880-2). Since I gave those lectures, however, some well-disposed friends have suggested to me a doubt whether my gratitude was not expressed too extravagantly on that occasion. In their view I ought to have done as I had previously been accustomed to do: treated Breuer's 'cathartic procedure' as a preliminary stage of psycho-analysis, and represented psycho-analysis itself as beginning with my discarding the hypnotic technique and introducing free associations. It is of no great importance in any case whether the history of psycho-analysis is reckoned as beginning with the cathartic method or with my modification of it; I refer to this uninteresting point merely because certain opponents of psycho-analysis have a habit of occasionally recollecting that after all the art of psycho-analysis was not invented by me, but by Breuer. This only happens, of course, if their views allow them to find something in it deserving attention; if they set no such limits to their rejection of it, psycho-analysis is always without question my work alone. I have never heard that Breuer's great share in psycho-analysis has earned him a proportionate measure of criticism and abuse. As I have long recognized that to stir up contradiction and arouse bitterness is the inevitable fate of psycho-analysis, I have come to the conclusion that I must be the true originator of all that is particularly characteristic in it. I am happy to be able to add that none of the efforts to minimize my part in creating this much-abused analysis have ever come from Breuer himself or could claim any support from him.

Breuer's discoveries have so often been described that I can dispense with discussing them in detail here. These were the fundamental fact that the symptoms of hysterical patients are founded upon scenes in their past lives which have made a great impression on them but have been forgotten (traumas); the therapy founded upon this, which consisted in causing them to remember and reproduce these experiences in a state of hypnosis (catharsis); and the fragment of theory inferred from it, which was that these symptoms represented an abnormal employment of amounts of excitation which had not been disposed of (conversion). Whenever Breuer, in his theoretical contribution to the *Studies on Hysteria* (1895), referred to this process of conversion, he always added my name in brackets after it, as though the priority for this first attempt at theoretical evaluation belonged to me. I believe that actually this distinction relates only to the name, and that the conception came to us simultaneously and together.

¹ In my 'Five Lectures' (1910a), delivered at Clark University.

It is well known, too, that after Breuer made his first discovery of the cathartic method he let it rest for a number of years, and only took it up again at my instigation, on my return from my studies under Charcot. He had a large consulting practice in medicine which made great claims on him; I myself had only unwillingly taken up the profession of medicine, but I had at that time a strong motive for helping people suffering from nervous affections or at least for wishing to understand something about their states. I had embarked upon physical therapy, and had felt absolutely helpless after the disappointing results from my study of Erb's *Elektrotherapie*, which put forward such a number of indications and recommendations. If I did not at the time arrive on my own account at the conclusion which Möbius established later, that the successes of electrical treatment in nervous patients are the effects of suggestion, there is no doubt that only the total absence of these promised successes was to blame. Treatment by suggestion during deep hypnosis, which I learned from Liébeault's and Bernheim's highly impressive demonstrations, then seemed to offer a satisfactory substitute for the failure of electrical treatment. But the practice of *investigating* patients in a state of hypnosis, with which Breuer made me acquainted - a practice which combined an automatic mode of operation with the satisfaction of scientific curiosity - was bound to be incomparably more attractive than the monotonous, forcible prohibitions used in treatment by suggestion, prohibitions which stood in the way of all research.

We have recently received a piece of advice, purporting to represent one of the latest developments of psycho-analysis, to the effect that the current conflict and the exciting cause of illness are to be brought into the foreground in analysis. Now this is exactly what Breuer and I used to do at the beginning of our work with the cathartic method. We led the patient's attention directly to the traumatic scene in which the symptom had arisen, and we endeavoured to discover the mental conflict in that scene and to release the suppressed affect in it. In the course of this we discovered the mental process, characteristic of the neuroses, which I later named 'regression'. The patient's associations moved back from the scene which we were trying to elucidate to earlier experiences, and compelled the analysis, which was supposed to correct the present, to occupy itself with the past. This regression led constantly further backwards; at first it seemed regularly to bring us to puberty; later on, failures and points which still eluded explanation drew the analytic work still further back into years of childhood which had hitherto been inaccessible to any kind of exploration. This regressive direction became an important characteristic of analysis. It appeared that psycho-analysis could explain nothing belonging to the present without referring back to something past; indeed, that every pathogenic experience implied a previous experience which, though not in itself pathogenic, had yet endowed the later one with its pathogenic quality. The temptation to confine one's attention to the known present exciting cause was so strong, however, that even in later analyses I gave way to it. In the analysis of the patient I named 'Dora', carried out in 1899, I had knowledge of the scene which occasioned the outbreak of the current illness. I tried innumerable times to submit this experience to analysis, but even direct demands always failed to produce from her anything more than the same meagre and incomplete description of it. Not until a long détour, leading back over her earliest childhood, had been made, did a dream present itself which on analysis brought to her mind the hitherto forgotten details of this scene, so that a comprehension and a solution of the current conflict became possible.

This one example shows how very misleading is the advice referred to above, and what a degree of scientific regression is represented by the neglect of regression in analytic technique which is thus recommended to us.

The first difference between Breuer and myself came to light on a question concerning the finer psychical mechanism of hysteria. He gave preference to a theory which was still to some extent physiological, as one might say; he tried to explain the mental splitting in hysterical patients by the absence of communication between various mental states ('states of consciousness', as we called them at that time), and he therefore constructed the theory of 'hypnoid states', the products of which were supposed to penetrate into 'waking consciousness' like unassimilated foreign bodies. I had taken the matter less scientifically; everywhere I seemed to discern motives and tendencies analogous to those of everyday life, and I looked upon psychical splitting itself as an effect of a process of repelling which at that time I called 'defence', and later, 'repression'. I made a short-lived attempt to allow the two mechanisms a separate existence side by side, but as observation showed me always and only one thing, it was not long before my 'defence' theory took up its stand opposite his 'hypnoid' one.

I am quite sure, however, that this opposition between our views had nothing to do with the breach in our relations which followed shortly after. This had deeper causes, but it came about in such a way that at first I did not understand it; it was only later that I learnt from many clear indications how to interpret it. It will be remembered that Breuer said of his famous first patient that the element of sexuality was astonishingly undeveloped in her and had contributed nothing to the very rich clinical picture of the case. I have always wondered why the critics did not more often cite this assertion of Breuer's as an argument against my contention of a sexual aetiology in the neuroses, and even to-day I do not know whether I ought to regard the omission as evidence of tact or of carelessness on their part. Anyone who reads the history of Breuer's case now in the light of the knowledge gained in the last twenty years will at once perceive the symbolism in it - the snakes, the stiffening, the paralysis of the arm - and, on taking into account the situation at the bedside of the young woman's sick father, will easily guess the real interpretation of her symptoms; his opinion of the part played by sexuality in her mental life will therefore be very different from that of her doctor. In his treatment of her case, Breuer was able to make use of a very intense suggestive *rapport* with the patient, which may serve us as a complete prototype of what we call 'transference' to-day. Now I have strong reasons for suspecting that after all her symptoms had been relieved Breuer must have discovered from further indications the sexual motivation of this transference, but that the universal nature of this unexpected phenomenon escaped him, with the result that, as though confronted by an 'untoward event',¹ he broke off all further investigation. He never said this to me in so many words, but he told me enough at different times to justify this reconstruction of what happened. When I later began more and more resolutely to put forward the significance of sexuality in the aetiology of neuroses, he was the first to show the reaction of distaste and repudiation which was later to become so familiar to me, but which at that time I had not yet learnt to recognize as my inevitable fate.

The fact of the emergence of the transference in its crudely sexual form, whether affectionate or hostile, in every treatment of a neurosis, although this is neither desired nor induced by either doctor or patient, has always seemed to me the most irrefragable proof that the source of the driving forces of neurosis lies in sexual life. This argument has never received anything approaching the degree of attention that it merits, for if it had, investigations in this field would leave no other conclusion open. As far as I am concerned, this argument has remained the decisive one, over and above the more specific findings of analytic work.

¹ [In English in the original.]

There was some consolation for the bad reception accorded to my contention of a sexual aetiology in the neuroses even by my more intimate circle of friends - for a vacuum rapidly formed itself about my person - in the thought that I was taking up the fight for a new and original idea. But, one day, certain memories gathered in my mind which disturbed this pleasing notion, but which gave me in exchange a valuable insight into the processes of human creative activity and the nature of human knowledge. The idea for which I was being made responsible had by no means originated with me. It had been imparted to me by three people whose opinion had commanded my deepest respect - by Breuer himself, by Charcot, and by Chrobak, the gynaecologist at the University, perhaps the most eminent of all our Vienna physicians. These three men had all communicated to me a piece of knowledge which, strictly speaking, they themselves did not possess. Two of them later denied having done so when I reminded them of the fact; the third (the great Charcot) would probably have done the same if it had been granted me to see him again. But these three identical opinions, which I had heard without understanding, had lain dormant in my mind for years, until one day they awoke in the form of an apparently original discovery.

One day, when I was a young house-physician, I was walking across the town with Breuer, when a man came up who evidently wanted to speak to him urgently. I fell behind. As soon as Breuer was free, he told me in his friendly, instructive way that this man was the husband of a patient of his and had brought him some news of her. The wife, he added, was behaving in such a peculiar way in society that she had been brought to him for treatment as a nervous case. He concluded: 'These things are always *secrets d'alcôve*!' I asked him in astonishment what he meant, and he answered by explaining the word *alcôve* ('marriage-bed') to me, for he failed to realize how extraordinary the *matter* of his statement seemed to me.

Some years later, at one of Charcot's evening receptions, I happened to be standing near the great teacher at a moment when he appeared to be telling Brouardel a very interesting story about something that had happened during his day's work. I hardly heard the beginning, but gradually my attention was seized by what he was talking of: a young married couple from a distant country in the East - the woman a severe sufferer, the man either impotent or exceedingly awkward. '*Tâchez donc,*' I heard Charcot repeating, '*je vous assure, vous y arriverez.*'¹ Brouardel, who spoke less loudly, must have expressed his astonishment that symptoms like the wife's could have been produced by such circumstances. For Charcot suddenly broke out with great animation: '*Mais, dans des cas pareils c'est toujours la chose génitale, toujours . . . toujours . . . toujours*';² and he crossed his arms over his stomach, hugging himself and jumping up and down on his toes several times in his own characteristically lively way. I know that for a moment I was almost paralysed with amazement and said to myself: 'Well, but if he knows that, why does he never say so?' But the impression was soon forgotten; brain anatomy and the experimental induction of hysterical paralyses absorbed all my interest.

A year later, I had begun my medical career in Vienna as a lecturer in nervous diseases, and in everything relating to the aetiology of the neuroses I was still as ignorant and innocent as one could expect of a promising student trained at a university. One day I had a friendly message from Chrobak, asking me to take a woman patient of his to whom he could not give enough time, owing to his new appointment as a University teacher. I arrived at the patient's house before he did and found that she was suffering from attacks of meaningless anxiety, and could only be soothed by the most precise information about where her doctor was at every moment of the day. When Chrobak arrived he took me aside and told me that the patient's anxiety was due to the fact that although she had been married for eighteen years she was still *virgo intacta*. The husband was absolutely impotent. In such cases, he said, there was nothing for a medical man to do but to shield this domestic misfortune with his own reputation, and put up with it if people shrugged their shoulders and said of him: 'He's no good if he can't cure her after so many years.' The sole prescription for such a malady, he added, is familiar enough to us, but we cannot order it. It runs:

'Rx Penis normalis
 dosim
 repetatur!'

I had never heard of such a prescription, and felt inclined to shake my head over my kind friend's cynicism.

¹ ['Go on trying! I promise you, you'll succeed.']

² ['But in this sort of case it's always a question of the genitals - always, always, always.']

I have not of course disclosed the illustrious parentage of this scandalous idea in order to saddle other people with the responsibility for it. I am well aware that it is one thing to give utterance to an idea once or twice in the form of a passing *aperçu*, and quite another to mean it seriously - to take it literally and pursue it in the face of every contradictory detail, and to win it a place among accepted truths. It is the difference between a casual flirtation and a legal marriage with all its duties and difficulties. '*Épouser les idées de . . .*'¹ is no uncommon figure of speech, at any rate in French.

Among the other new factors which were added to the cathartic procedure as a result of my work and which transformed it into psycho-analysis, I may mention in particular the theory of repression and resistance, the recognition of infantile sexuality, and the interpreting and exploiting of dreams as a source of knowledge of the unconscious.

The theory of repression quite certainly came to me independently of any other source; I know of no outside impression which might have suggested it to me, and for a long time I imagined it to be entirely original, until Otto Rank (1911a) showed us a passage in Schopenhauer's *World as Will and Idea* in which the philosopher seeks to give an explanation of insanity. What he says there about the struggle against accepting a distressing piece of reality coincides with my concept of repression so completely that once again I owe the chance of making a discovery to my not being well-read. Yet others have read the passage and passed it by without making this discovery, and perhaps the same would have happened to me if in my young days I had had more taste for reading philosophical works. In later years I have denied myself the very great pleasure of reading the works of Nietzsche, with the deliberate object of not being hampered in working out the impressions received in psycho-analysis by any sort of anticipatory ideas. I had therefore to be prepared - and I am so, gladly - to forgo all claims to priority in the many instances in which laborious psycho-analytic investigation can merely confirm the truths which the philosopher recognized by intuition.

¹ ['To espouse an idea.']

The theory of repression is the corner-stone on which the whole structure of psycho-analysis rests. It is the most essential part of it; and yet it is nothing but a theoretical formulation of a phenomenon which may be observed as often as one pleases if one undertakes an analysis of a neurotic without resorting to hypnosis. In such cases one comes across a resistance which opposes the work of analysis and in order to frustrate it pleads a failure of memory. The use of hypnosis was bound to hide this resistance; the history of psycho-analysis proper, therefore, only begins with the new technique that dispenses with hypnosis. The theoretical consideration of the fact that this resistance coincides with an amnesia leads inevitably to the view of unconscious mental activity which is peculiar to psycho-analysis and which, too, distinguishes it quite clearly from philosophical speculations about the unconscious. It may thus be said that the theory of psycho-analysis is an attempt to account for two striking and unexpected facts of observation which emerge whenever an attempt is made to trace the symptoms of a neurotic back to their sources in his past life: the facts of transference and of resistance. Any line of investigation which recognizes these two facts and takes them as the starting-point of its work has a right to call itself psycho-analysis, even though it arrives at results other than my own. But anyone who takes up other sides of the problem while avoiding these two hypotheses will hardly escape a charge of misappropriation of property by attempted impersonation, if he persists in calling himself a psycho-analyst.

If anyone sought to place the theory of repression and resistance among the *premisses* instead of the *findings* of psycho-analysis, I should oppose him most emphatically. Such premisses of a general psychological and biological nature do exist, and it would be useful to consider them on some other occasion; but the theory of repression is a product of psycho-analytic work, a theoretical inference legitimately drawn from innumerable observations.

Another product of this sort was the hypothesis of infantile sexuality. This, however, was made at a much later date. In the early days of tentative investigation by analysis no such thing was thought of. At first it was merely observed that the effects of present-day experiences had to be traced back to something in the past. But enquirers often find more than they bargain for. One was drawn further and further back into the past; one hoped at last to be able to stop at puberty, the period in which the sexual impulses are traditionally supposed to awake. But in vain; the tracks led still further back into childhood and into its earlier years. On the way, a mistaken idea had to be overcome which might have been almost fatal to the young science. Influenced by Charcot's view of the traumatic origin of hysteria, one was readily inclined to accept as true and aetiologically significant the statements made by patients in which they ascribed their symptoms to passive sexual experiences in the first years of childhood - to put it bluntly, to seduction. When this aetiology broke down under the weight of its own improbability and contradiction in definitely ascertainable circumstances, the result at first was helpless bewilderment. Analysis had led back to these infantile sexual traumas by the right path, and yet they were not true. The firm ground of reality was gone. At that time I would gladly have given up the whole work, just as my esteemed predecessor, Breuer, had done when he made his unwelcome discovery. Perhaps I persevered only because I no longer had any choice and could not then begin again at anything else. At last came the reflection that, after all, one had no right to despair because one has been deceived in one's expectations; one must revise those expectations. If hysterical subjects trace back their symptoms to traumas that are fictitious, then the new fact which emerges is precisely that they create such scenes in *phantasy*, and this psychical reality requires to be taken into account alongside practical reality. This reflection was soon followed by the discovery that these phantasies were intended to cover up the auto-erotic activity of the first years of childhood, to embellish it and raise it to a higher plane. And now, from behind the phantasies, the whole range of a child's sexual life came to light.

With this sexual activity of the first years of childhood the inherited constitution of the individual also came into its own. Disposition and experience are here linked up in an indissoluble aetiological unity. For *disposition* exaggerates impressions which would otherwise have been completely commonplace and have had no effect, so that they become traumas giving rise to stimulations and fixations; while *experiences* awaken factors in the disposition which, without them, might have long remained dormant and perhaps never have developed. The last word on the subject of traumatic aetiology was spoken later by Abraham, when he pointed out that the sexual constitution which is peculiar to children is precisely calculated to provoke sexual experiences of a particular kind - namely traumas.

In the beginning, my statements about infantile sexuality were founded almost exclusively on the findings of analysis in adults which led back into the past. I had no opportunity of direct observations on children. It was therefore a very great triumph when it became possible years later to confirm almost all my inferences by direct observation and the analysis of very young children - a triumph that lost some of its magnitude as one gradually realized that the nature of the discovery was such that one should really be ashamed of having had to make it. The further one carried these observations on children, the more self-evident the facts became; but the more astonishing, too, did it become that one had taken so much trouble to overlook them.

Such a certain conviction of the existence and importance of infantile sexuality can, however, only be obtained by the method of analysis, by pursuing the symptoms and peculiarities of neurotics back to their ultimate sources, the discovery of which then explains whatever is explicable in them and enables whatever is modifiable to be changed. I can understand that one would arrive at different results if, as C. G. Jung has recently done, one first forms a theoretical conception of the nature of the sexual instinct and then seeks to explain the life of children on that basis. A conception of this kind is bound to be selected arbitrarily or in accordance with irrelevant considerations, and runs the risk of proving inadequate for the field to which one is seeking to apply it. It is true that the analytic method, too, leads to certain ultimate difficulties and obscurities in regard to sexuality and its relation to the total life of the individual. But these problems cannot be got rid of by speculation; they must await solution through other observations or through observations in other fields.

I need say little about the interpretation of dreams. It came as the first fruits of the technical innovation I had adopted when, following a dim presentiment, I decided to replace hypnosis by free association. My desire for knowledge had not at the start been directed towards understanding dreams. I do not know of any outside influence which drew my interest to them or inspired me with any helpful expectations. Before Breuer and I ceased to meet I only just had time to tell him in a single sentence that I now understood how to translate dreams. Since this was how the discovery came about, it followed that the *symbolism* in the language of dreams was almost the last thing to become accessible to me, for the dreamer's associations help very little towards understanding symbols. I have held fast to the habit of always studying things themselves before looking for information about them in books, and therefore I was able to establish the symbolism of dreams for myself before I was led to it by Scherner's work on the subject. It was only later that I came to appreciate to its full extent this mode of expression of dreams. This was partly through the influence of the works of Stekel, who at first did such very creditable work but afterwards went totally astray. The close connection between psycho-analytic dream-interpretation and the art of interpreting dreams as practised and held in such high esteem in antiquity only became clear to me much later. Later on I found the essential characteristic and most important part of my dream theory - the derivation of dream-distortion from an internal conflict, a kind of inner dishonesty - in a writer who was ignorant, it is true, of medicine, though not of philosophy, the famous engineer J. Popper, who published his *Phantasien eines Realisten* under the name of Lynkeus.

The interpretation of dreams became a solace and a support to me in those arduous first years of analysis, when I had to master the technique, clinical phenomena and therapy of the neuroses all at the same time. At that period I was completely isolated and in the network of problems and accumulation of difficulties I often dreaded losing my bearings and also my confidence. There were often patients with whom an unaccountably long time elapsed before my hypothesis, that a neurosis was bound to become intelligible through analysis, proved true; but these patients' dreams, which might be regarded as analogues of their symptoms, almost always confirmed the hypothesis.

It was only my success in this direction that enabled me to persevere. The result is that I have acquired a habit of gauging the measure of a psychologist's understanding by his attitude to dream-interpretation; and I have observed with satisfaction that most of the opponents of psycho-analysis avoid this field altogether or else display remarkable clumsiness if they attempt to deal with it. Moreover, I soon saw the necessity of carrying out a self-analysis, and this I did with the help of a series of my own dreams which led me back through all the events of my childhood; and I am still of the opinion to-day that this kind of analysis may suffice for anyone who is a good dreamer and not too abnormal.

I think that by thus unrolling the story of the development of psycho-analysis I have shown what it is, better than by a systematic description of it. I did not at first perceive the peculiar nature of what I had discovered. I unhesitatingly sacrificed my growing popularity as a doctor, and the increase in attendance during my consulting hours, by making a systematic enquiry into the sexual factors involved in the causation of my patients' neuroses; and this brought me a great many new facts which finally confirmed my conviction of the practical importance of the sexual factor. I innocently addressed a meeting of the Vienna Society for Psychiatry and Neurology with Krafft-Ebing in the chair, expecting that the material losses I had willingly undergone would be made up for by the interest and recognition of my colleagues. I treated my discoveries as ordinary contributions to science and hoped they would be received in the same spirit. But the silence which my communications met with, the void which formed itself about me, the hints that were conveyed to me, gradually made me realize that assertions on the part played by sexuality in the aetiology of the neuroses cannot count upon meeting with the same kind of treatment as other communications. I understood that from now onwards I was one of those who have 'disturbed the sleep of the world', as Hebbel says, and that I could not reckon upon objectivity and tolerance. Since, however, my conviction of the general accuracy of my observations and conclusions grew even stronger, and since neither my confidence in my own judgement nor my moral courage were precisely small, the outcome of the situation could not be in doubt. I made up my mind to believe that it had been my fortune to discover some particularly important facts and connections, and I was prepared to accept the fate that sometimes accompanies such discoveries.

I pictured the future as follows: - I should probably succeed in maintaining myself by means of the therapeutic success of the new procedure, but science would ignore me entirely during my lifetime; some decades later, someone else would infallibly come upon the same things - for which the time was not now ripe - would achieve recognition for them and bring me honour as a forerunner whose failure had been inevitable. Meanwhile, like Robinson Crusoe, I settled down as comfortably as possible on my desert island. When I look back to those lonely years, away from the pressures and confusions of to-day, it seems like a glorious heroic age. My 'splendid isolation'¹ was not without its advantages and charms. I did not have to read any publications, nor listen to any ill-informed opponents; I was not subject to influence from any quarter; there was nothing to hustle me. I learnt to restrain speculative tendencies and to follow the unforgotten advice of my master, Charcot: to look at the same things again and again until they themselves begin to speak. My publications, which I was able to place with a little trouble, could always lag far behind my knowledge, and could be postponed as long as I pleased, since there was no doubtful 'priority' to be defended. *The Interpretation of Dreams*, for instance, was finished in all essentials at the beginning of 1896 but was not written out until the summer of 1899. The analysis of 'Dora' was over at the end of 1899; the case history was written in the next two weeks, but was not published until 1905. Meanwhile my writings were not reviewed in the medical journals, or, if as an exception they were reviewed, they were dismissed with expressions of scornful or pitying superiority. Occasionally a colleague would make some reference to me in one of his publications; it would be very short and not at all flattering - words such as 'eccentric', 'extreme', or 'very peculiar' would be used. It once happened that an assistant at the clinic in Vienna where I gave my University lectures asked me for permission to attend the course. He listened very attentively and said nothing; after the last lecture was over he offered to join me outside. As we walked away, he told me that with his chief's knowledge he had written a book combating my views; he regretted very much, however, that he had not first learnt more about them from my lectures, for in that case he would have written much of it differently. He had indeed enquired at the clinic whether he had not better first read *The Interpretation of Dreams*, but had been advised against doing so - it was not worth the trouble. He then himself compared the structure of my theory, so far as he now understood it, with that of the Catholic Church as regards its internal solidity. In the interests of the salvation of his soul, I shall assume that this remark implied a certain amount of appreciation. But he concluded by saying that it was too late to alter anything in his book, since it was already in print. Nor did my colleague think it necessary later to make any public avowal of his change of views on the subject of psycho-analysis; but preferred, in his capacity as a regular reviewer for a medical journal, to follow its development with flippant comments.

¹ [In English in the original.]

Whatever personal sensitiveness I possessed became blunted during those years, to my advantage. I was saved from becoming embittered, however, by a circumstance which is not always present to help lonely discoverers. Such people are as a rule tormented by the need to account for the lack of sympathy or the aversion of their contemporaries, and feel this attitude as a distressing contradiction of the security of their own sense of conviction. There was no need for me to feel so; for psycho-analytic theory enabled me to understand this attitude in my contemporaries and to see it as a necessary consequence of fundamental analytic premisses. If it was true that the set of facts I had discovered were kept from the knowledge of patients themselves by internal resistances of an affective kind, then these resistances would be bound to appear in healthy people too, as soon as some external source confronted them with what was repressed. It was not surprising that they should be able to justify this rejection of my ideas on intellectual grounds though it was actually affective in origin. The same thing happened equally often with patients; the arguments they advanced were the same and were not precisely brilliant. In Falstaff's words, reasons are 'as plenty as blackberries'. The only difference was that with patients one was in a position to bring pressure to bear on them so as to induce them to get insight into their resistances and overcome them, whereas one had to do without this advantage in dealing with people who were ostensibly healthy. How to compel these healthy people to examine the matter in a cool and scientifically objective spirit was an unsolved problem which was best left to time to clear up. In the history of science one can clearly see that often the very proposition which has at first called out nothing but contradiction has later come to be accepted, although no new proofs in support of it have been brought forward.

It was hardly to be expected, however, that during the years when I alone represented psycho-analysis I should develop any particular respect for the world's opinion or any bias towards intellectual appeasement.

II

From the year 1902 onwards, a number of young doctors gathered round me with the express intention of learning, practising and spreading the knowledge of psycho-analysis. The stimulus came from a colleague who had himself experienced the beneficial effects of analytic therapy. Regular meetings took place on certain evenings at my house, discussions were held according to certain rules and the participants endeavoured to find their bearings in this new and strange field of research and to interest others in it. One day a young man who had passed through a technical training college introduced himself with a manuscript which showed very unusual comprehension. We persuaded him to go through the *Gymnasium* [Secondary School] and the University and to devote himself to the non-medical side of psycho-analysis. The little society acquired in him a zealous and dependable secretary and I gained in Otto Rank a most loyal helper and co-worker.¹

The small circle soon expanded, and in the course of the next few years often changed its composition. On the whole I could tell myself that it was hardly inferior, in wealth and variety of talent, to the staff of any clinical teacher one could think of. It included from the beginning the men who were later to play such a considerable, if not always a welcome, part in the history of the psycho-analytic movement. At that time, however, one could not yet guess at these developments. I had every reason to be satisfied, and I think I did everything possible to impart my own knowledge and experience to the others. There were only two inauspicious circumstances which at last estranged me inwardly from the group. I could not succeed in establishing among its members the friendly relations that ought to obtain between men who are all engaged upon the same difficult work; nor was I able to stifle the disputes about priority for which there were so many opportunities under these conditions of work in common. The difficulties in the way of giving instruction in the practice of psycho-analysis, which are quite particularly great and are responsible for much in the present dissensions, were evident already in this private Vienna Psycho-Analytical Society. I myself did not venture to put forward a still unfinished technique and a theory still in the making with an authority which would probably have enabled the others to avoid some wrong turnings and ultimate disasters. The self-reliance of intellectual workers, their early independence of their teacher, is always gratifying from a psychological point of view; but it is only of advantage to science if those workers fulfil certain personal conditions which are none too common. For psycho-analysis in particular a long and severe discipline and training in self-discipline would have been required. In view of the courage displayed by their devotion to a subject so much frowned upon and so poor in prospects, I was disposed to tolerate much among the members to which I should otherwise have made objection. Besides doctors, the circle included others - men of education who had recognized something important in psycho-analysis: writers, painters and so on. My *Interpretation of Dreams* and my book on jokes, among others, had shown from the beginning that the theories of psycho-analysis cannot be restricted to the medical field, but are capable of application to a variety of other mental sciences.

¹ [Footnote added 1924:] Now director of the Internationaler Psychoanalytischer Verlag [International Psycho-Analytical Publishing House] and editor of the *Zeitschrift* and *Imago* from their inception.

In 1907 the situation changed all at once and contrary to all expectations. It appeared that psycho-analysis had unobtrusively awakened interest and gained friends, and that there were even some scientific workers who were ready to acknowledge it. A communication from Bleuler had informed me before this that my works had been studied and made use of in the Burghölzli. In January 1907, the first member of the Zurich clinic came to Vienna - Dr. Eitingon.¹ Other visits followed, which led to an animated exchange of ideas. Finally, on the invitation of C. G. Jung, at that time still assistant physician at the Burghölzli, a first meeting took place at Salzburg in the spring of 1908, which brought together friends of psycho-analysis from Vienna, Zurich and other places. One of the results of this first Psycho-Analytical Congress was the founding of a periodical called the *Jahrbuch für psychoanalytische und psychopathologische Forschungen*, under the direction of Bleuler and Freud and edited by Jung, which first appeared in 1909. This publication gave expression to an intimate co-operation between Vienna and Zurich.

I have repeatedly acknowledged with gratitude the great services rendered by the Zurich School of Psychiatry in the spread of psycho-analysis, particularly by Bleuler and Jung, and I have no hesitation in doing so again, even in the greatly altered circumstances of the present. True, it was not the support of the Zurich School which first directed the attention of the scientific world to psycho-analysis at that time. What had happened was that the latency period had expired and everywhere psycho-analysis was becoming the object of ever-increasing interest. But in all other places this accession of interest at first produced nothing but a very emphatic repudiation, mostly a quite passionate one; whereas in Zurich, on the contrary, agreement on general lines was the dominant note. Moreover, nowhere else did such a compact little group of adherents exist, or could a public clinic be placed at the service of psycho-analytic researches, or was there a clinical teacher who included psycho-analytic theories as an integral part of his psychiatric course. The Zurich group thus became the nucleus of the small band who were fighting for the recognition of analysis. The only opportunity of learning the new art and working at it in practice lay there. Most of my followers and co-workers at the present time came to me by way of Zurich, even those who were geographically much nearer to Vienna than to Switzerland. In relation to Western Europe, which contains the great centres of our culture, the position of Vienna is an outlying one; and its prestige has for many years been affected by strong prejudices. Representatives of all the most important nations congregate in Switzerland, where intellectual activity is so lively; a focus of infection there was bound to be of great importance for the spread of the 'psychical epidemic', as Hoche of Freiburg has called it.

¹ [Footnote added 1924:] The subsequent founder of the 'Psycho-Analytic Policlinic' in Berlin.

According to the evidence of a colleague who witnessed developments at the Burghölzli, it appears that psycho-analysis awakened interest there very early. In Jung's work on occult phenomena, published in 1902, there was already an allusion to my book on dream-interpretation. From 1903 or 1904, says my informant, psycho-analysis was in the forefront of interest. After personal relations between Vienna and Zurich had been established, an informal society was also started, in the middle of 1907, in the Burghölzli, where the problems of psycho-analysis were discussed at regular meetings. In the alliance between the Vienna and Zurich schools the Swiss were by no means mere recipients. They had already produced very creditable scientific work, the results of which were of service to psycho-analysis. The association experiments started by the Wundt School had been interpreted by them in a psycho-analytic sense, and had proved applicable in unexpected ways. By this means it had become possible to arrive at rapid experimental confirmation of psycho-analytic observations and to demonstrate directly to students certain connections which an analyst would only have been able to tell them about. The first bridge linking up experimental psychology with psycho-analysis had been built.

In psycho-analytic treatment, association experiments enable a provisional, qualitative analysis of the case to be made, but they furnish no essential contribution to the technique and can be dispensed with in carrying out analyses. More important, however, was another achievement by the Zurich school, or its leaders, Bleuler and Jung. The former showed that light could be thrown on a large number of purely psychiatric cases by adducing the same processes as have been recognized through psycho-analysis to obtain in dreams and neuroses (Freudian mechanisms); and Jung successfully applied the analytic method of interpretation to the most alien and obscure phenomena of dementia praecox, so that their sources in the life-history and interests of the patient came clearly to light. After this it was impossible for psychiatrists to ignore psycho-analysis any longer. Bleuler's great work on schizophrenia (1911), in which the psycho-analytic point of view was placed on an equal footing with the clinical systematic one, completed this success.

I will not omit to point out a divergence which was already at that time noticeable in the direction taken by the work of the two schools. As early as in 1897 I had published the analysis of a case of schizophrenia, which however was of a paranoid character, so that the solution of it could not take away from the impression made by Jung's analyses. But to me the important point had been, not so much the possibility of interpreting the symptoms, as the psychological mechanism of the disease, and above all the agreement of this mechanism with that of hysteria, which had already been discovered. At that time no light had yet been thrown on the differences between the two mechanisms. For I was then already aiming at a libido theory of the neuroses, which was to explain all neurotic and psychotic phenomena as proceeding from abnormal vicissitudes of the libido, that is, as diversions from its normal employment. This point of view was missed by the Swiss investigators. As far as I know, even to-day Bleuler maintains the view that the various forms of dementia praecox have an organic causation; and at the Salzburg Congress in 1908 Jung, whose book on this disease had appeared in 1907, supported the toxic theory of its causation, which takes no account of the libido theory, although it is true that it does not rule it out. Later on (1912) he came to grief on this same point, by making too much of the material which he had previously refused to employ.

There is a third contribution made by the Swiss School, probably to be ascribed entirely to Jung, which I do not value so highly as others do whose concern with these matters is more remote. I refer to the theory of 'complexes' which grew out of the *Diagnostische Assoziationsstudien* [*Studies in Word-Association*] (1906). It has neither itself produced a psychological theory, nor has it proved capable of easy incorporation into the context of psycho-analytic theory. The word 'complex', on the other hand, had become naturalized, so to speak, in psycho-analytic language; it is a convenient and often indispensable term for summing up a psychological state descriptively. None of the other terms coined by psycho-analysis for its own needs has achieved such widespread popularity or been so misapplied to the detriment of the construction of clearer concepts. Analysts began to speak among themselves of a 'return of a complex' where they meant a 'return of the repressed', or fell into the habit of saying 'I have a complex against him', where the only correct expression would have been 'a resistance against him'.

In the years following 1907, when the schools of Vienna and Zurich were united, psycho-analysis made the extraordinary surge forward of which the momentum is felt even to-day; this is shown both by the spread of psycho-analytic literature and by the constant increase in the number of doctors who are practising or studying it, as well as by the frequency of the attacks made on it at Congresses and in learned societies. It has penetrated into the most distant lands and has everywhere not merely startled psychiatrists but commanded the attention of the educated public and of scientific workers in other fields. Havelock Ellis, who has followed its development with sympathy though without ever calling himself an adherent, wrote in 1911 in a report for the Australasian Medical Congress: 'Freud's psycho-analysis is now championed and carried out not only in Austria and in Switzerland, but in the United States, in England, in India, in Canada, and, I doubt not, in Australasia.'¹ A physician from Chile (probably a German) spoke at the International Congress at Buenos Aires in 1910 in support of the existence of infantile sexuality and commended highly the effects of psycho-analytic therapy on obsessional symptoms.² An English neurologist in Central India (Berkeley-Hill) informed me, through a distinguished colleague who was visiting Europe, that the analyses of Mohammedan Indians which he had carried out showed that the aetiology of their neuroses was no different from what we find in our European patients.

¹ Havelock Ellis, 1911.

² G. Greve, 1910.

The introduction of psycho-analysis into North America was accompanied by very special marks of honour. In the autumn of 1909, Stanley Hall, the President of Clark University, Worcester, Massachusetts, invited Jung and myself to take part in the celebration of the twentieth anniversary of the foundation of the University by giving a number of lectures in German. To our great surprise, we found the members of that small but highly esteemed University for the study of education and philosophy so unprejudiced that they were acquainted with all the literature of psycho-analysis and had given it a place in their lectures to students. In prudish America it was possible, in academic circles at least, to discuss freely and scientifically everything that in ordinary life is regarded as objectionable. The five lectures which I improvised in Worcester appeared in an English translation in the *American Journal of Psychology*, and were shortly afterwards published in German under the title *Über Psychoanalyse*. Jung read a paper on diagnostic association experiments and another on conflicts in the mind of the child. We were rewarded with the honorary degree of Doctor of Laws. During that week of celebrations at Worcester, psycho-analysis was represented by five men: besides Jung and myself, there were Ferenczi, who had joined me for the journey, Ernest Jones, then at the University of Toronto (Canada) and now in London, and A. A. Brill, who was already practising psycho-analysis in New York.

The most important personal relationship which arose from the meeting at Worcester was that with James J. Putnam, Professor of Neuropathology at Harvard University. Some years before, he had expressed an unfavourable opinion of psycho-analysis, but now he rapidly became reconciled to it and recommended it to his countrymen and his colleagues in a series of lectures which were as rich in content as they were brilliant in form. The esteem he enjoyed throughout America on account of his high moral character and unflinching love of truth was of great service to psycho-analysis and protected it against the denunciations which in all probability would otherwise quickly have overwhelmed it. Later on, yielding too much to the strong ethical and philosophical bent of his nature, Putnam made what seems to me an impossible demand - he expected psycho-analysis to place itself at the service of a particular moral-philosophical conception of the Universe - but he remains the chief pillar of the psycho-analytic movement in his native land.¹

¹ [Footnote added 1924:] See Putnam's *Addresses on Psycho-Analysis*, 1921. Putnam died in 1918.

For the further spread of this movement Brill and Jones deserve the greatest credit: in their writings they drew their countrymen's attention with unremitting assiduity to the easily observable fundamental facts of everyday life, of dreams and neurosis. Brill has contributed still further to this effect by his medical practice and by his translations of my works, and Jones by his instructive lectures and by his skill in debate at congresses in America.¹ The absence of any deep-rooted scientific tradition in America and the much less stringent rule of official authority there have been of decided advantage to the impetus given by Stanley Hall. It was characteristic of that country that from the beginning professors and superintendents of mental hospitals showed as much interest in analysis as independent practitioners. But it is clear that precisely for this reason the ancient centres of culture, where the greatest resistance has been displayed, must be the scene of the decisive struggle over psycho-analysis.

Among European countries France has hitherto shown itself the least disposed to welcome psycho-analysis, although useful work in French by A. Maeder of Zurich has provided easy access to its theories. The first indications of sympathy came from the provinces: Morichau-Beauchant (Poitiers) was the first Frenchman to adhere publicly to psycho-analysis. Régis and Hesnard (Bordeaux) have recently attempted to disperse the prejudices of their countrymen against the new ideas by an exhaustive presentation, which, however, is not always understanding and takes special exception to symbolism. In Paris itself, a conviction still seems to reign (to which Janet himself gave eloquent expression at the Congress in London in 1913) that everything good in psycho-analysis is a repetition of Janet's views with insignificant modifications, and that everything else in it is bad. At this Congress itself, indeed, Janet had to submit to a number of corrections by Ernest Jones, who was able to point out to him his insufficient knowledge of the subject. Even though we deny his claims, however, we cannot forget the value of his work on the psychology of the neuroses.

¹ The publications of both authors have appeared in collected volumes: Brill, 1912, and Ernest Jones, 1913.

In Italy, after several promising starts, no real interest was forthcoming. To Holland analysis found early access through personal connections: Van Emden, Van Ophuijsen, Van Renterghem (*Freud en zijn School*) and the two Stärckes are actively occupied with it both in practice and theory.¹ In scientific circles in England interest in analysis has developed very slowly, but there is reason to expect that the sense for the practical and the passionate love of justice in the English will ensure it a brilliant future there.

In Sweden, P. Bjerre, who succeeded to Wetterstrand's practice, gave up hypnotic suggestion, at least for the time, in favour of analytic treatment. R. Vogt (Christiania) had already shown an appreciation of psycho-analysis in his *Psykiatriens grundtraek*, published in 1907; so that the first text-book of psychiatry to refer to psycho-analysis was written in Norwegian. In Russia, psycho-analysis has become generally known and has spread widely; almost all my writings, as well as those of other adherents of analysis, have been translated into Russian. But a really penetrating comprehension of analytic theories has not yet been evinced in Russia; so that the contributions of Russian physicians are at present not very notable. The only trained analyst there is M. Wulff who practises in Odessa. It is principally due to L. Jekels that psycho-analysis has been introduced to Polish scientific and literary circles. Hungary, so near geographically to Austria, and so far from it scientifically, has produced only one collaborator, S. Ferenczi, but one that indeed outweighs a whole society.²

¹ The first *official* recognition of dream-interpretation and psycho-analysis in Europe was extended to them by the psychiatrist Jelgersma, Rector of the University of Leyden, in his rectorial address on February 9, 1914.

² (*Footnote added 1923:*) It is not my intention, of course, to bring this account, written in 1914, 'up to date' [in English in the original]. I will only add a few remarks to indicate how the picture has altered in the interval, which includes the World War. In Germany a gradual infiltration of analytic theories into clinical psychiatry is taking place, though this is not always admitted. The French translations of my works that have been appearing during the last few years have finally aroused a keen interest in psycho-analysis even in France, though for the moment this is more active in literary circles than in scientific ones. In Italy M. Levi Bianchini (of Nocera Superiore) and Edoardo Weiss (of Trieste) have come forward as translators and champions of psycho-analysis (cf. the *Biblioteca Psicoanalitica Italiana*). A collected edition of my works which is appearing in Madrid (translated by Lopez Ballesteros) is evidence of the lively interest taken in it in Spanish-speaking countries (Prof. H. Delgado in Lima). As regards England, the prophecy which I have made above seems to be in steady course of fulfilment; a special centre for the study of analysis has been formed at Calcutta in British India. In North America it is still true that the depth of understanding of analysis does not keep pace with its popularity. In Russia, since the Revolution, psycho-analytic work has begun afresh at several centres. In Poland the *Polska Biblioteka Psychoanalityczna* is now appearing. In Hungary a brilliant analytic school is flourishing under the leadership of Ferenczi. (Cf. the *Festschrift* issued in honour of his fiftieth birthday.) At the present time the Scandinavian countries are still the least receptive.

As regards the position of psycho-analysis in Germany, it can only be said that it forms the centre-point of scientific discussions and provokes the most emphatic expressions of disagreement both among doctors and laymen; these are not yet at an end, but are constantly flaring up again, sometimes with greater intensity. No official educational bodies there have up to now recognized psycho-analysis. Successful practitioners who employ it are few; only a few institutions, such as Binswanger's in Kreuzlingen (on Swiss soil) and Marcinowski's in Holstein, have opened their doors to it. One of the most prominent representatives of analysis, Karl Abraham, at one time an assistant of Bleuler's, maintains himself in the critical atmosphere of Berlin. One might wonder that this state of things should have continued unaltered for several years if one did not know that the account I have given only represents external appearances. Too much significance should not be attributed to rejection by the official representatives of science and heads of institutions, and by the followers dependent on them. It is natural that its opponents should give loud expression to their views, while its intimidated adherents keep silence. Some of the latter, whose first contributions to analysis raised favourable expectations, have later withdrawn from the movement under the pressure of circumstances. The movement itself advances surely though silently; it is constantly gaining new adherents among psychiatrists and laymen, it brings in a growing stream of new readers for psycho-analytic literature and for that very reason drives its opponents to ever more violent defensive efforts. At least a dozen times in recent years, in reports of the proceedings of certain congresses and scientific bodies or in reviews of certain publications, I have read that now psycho-analysis is dead, defeated and disposed of once and for all. The best answer to all this would be in the terms of Mark Twain's telegram to the newspaper which had falsely published news of his death: 'Report of my death greatly exaggerated.' After each of these obituaries psycho-analysis regularly gained new adherents and co-workers or acquired new channels of publicity. After all, being declared dead was an advance on being buried in silence.

Hand in hand with this expansion of psycho-analysis in space went an expansion in content; it extended from the field of the neuroses and psychiatry to other fields of knowledge. I shall not treat this aspect of the development of our discipline in much detail, since this has been done with great success by Rank and Sachs in a volume (one of Löwenfeld's *Grenzfragen*) which deals exhaustively with precisely this side of analytic research. Moreover, this development is still in its infancy; it has been little worked at, consists mostly of tentative beginnings and in part of no more than plans. No reasonable person will see any grounds for reproach in this. An enormous mass of work confronts a small number of workers, most of whom have their main occupation elsewhere and can bring only the qualifications of an amateur to bear on the technical problems of these unfamiliar fields of science. These workers, who derive from psycho-analysis, make no secret of their amateurishness. Their aim is merely to act as sign-posts and stop-gaps for the specialists, and to put the analytic technique and principles at their disposal against a time when they in turn shall take up the work. That the results achieved are nevertheless not inconsiderable is due partly to the fruitfulness of the analytic method, and partly to the circumstance that there are already a few investigators who are not doctors, and have taken up the application of psycho-analysis to the mental sciences as their profession in life.

Most of these applications of analysis naturally go back to a hint in my earliest analytic writings. The analytic examination of neurotic people and the neurotic symptoms of normal people necessitated the assumption of psychological conditions which could not possibly be limited to the field in which they had been discovered. In this way analysis not only provided us with the explanation of pathological phenomena, but revealed their connection with normal mental life and disclosed unsuspected relationships between psychiatry and the most various other sciences dealing with activities of the mind. Certain typical dreams, for instance, yielded an explanation of some myths and fairy-tales. Riklin and Abraham followed this hint and initiated the researches into myths which have found their completion, in a manner complying with even expert standards, in Rank's works on mythology. Further investigation into dream-symbolism led to the heart of the problems of mythology, folklore (Jones and Storfer) and the abstractions of religion. A deep impression was made on all hearers at one of the psycho-analytical Congresses when a follower of Jung's demonstrated the correspondence between schizophrenic phantasies and the cosmogonies of primitive times and races. Mythological material later received further elaboration (which, though open to criticism, was none the less very interesting) at the hands of Jung, in works attempting to correlate the neuroses with religious and mythological phantasies.

Another path led from the investigation of dreams to the analysis of works of imagination and ultimately to the analysis of their creators - writers and artists themselves. At an early stage it was discovered that dreams invented by writers will often yield to analysis in the same way as genuine ones. (Cf. 'Gradiva'.) The conception of unconscious mental activity made it possible to form a preliminary idea of the nature of imaginative creative writing; and the realization, gained in the study of neurotics, of the part played by the instinctual impulses enabled us to perceive the sources of artistic production and confronted us with two problems: how the artist reacts to this instigation and what means he employs to disguise his reactions.¹ Most analysts with general interests have contributed something to the solution of these problems, which are the most fascinating among the applications of psycho-analysis. Naturally, opposition was not lacking in this direction either on the part of people who knew nothing of analysis; it took the same form as it did in the original field of psycho-analytic research - the same misconceptions and vehement rejections. It was only to be expected from the beginning that, whatever the regions into which psycho-analysis might penetrate, it would inevitably experience the same struggles with those already in possession of the field. These attempted invasions, however, have not yet stirred up the attention in some quarters which awaits them in the future. Among the strictly scientific applications of analysis to literature, Rank's exhaustive work on the theme of incest easily takes the first place. Its subject is bound to arouse the greatest unpopularity. Up to the present, little work based on psycho-analysis has been done in the sciences of language and history. I myself ventured the first approach to the problems of the psychology of religion by drawing a parallel between religious ritual and the ceremonials of neurotics (1907*b*). Dr. Pfister, a pastor in Zurich, has traced back the origin of religious fanaticism to perverse eroticism in his book on the piety of Count von Zinzendorf, as well as in other contributions. In the latest works of the Zurich school, however, we find analysis permeated with religious ideas rather than the opposite outcome that had been in view.

¹ Cf. Rank's *Die Künstler* [*The Artists*], analyses of imaginative writers by Sadger, Reik, and others, my own small work on a childhood memory of Leonardo da Vinci's, and Abraham's analysis of Segantini.

In the four essays with the title *Totem and Taboo* I have made an attempt to deal with the problems of social anthropology in the light of analysis; this line of investigation leads direct to the origins of the most important institutions of our civilization, of the structure of the state, of morality and religion, and, moreover, of the prohibition against incest and of conscience. It is no doubt too early to decide how far the conclusions thus reached will be able to withstand criticism.

The first example of an application of the analytic mode of thought to the problems of aesthetics was contained in my book on jokes. Everything beyond this is still awaiting workers, who may expect a particularly rich harvest in this field. We are entirely without the co-operation of specialists in all these branches of knowledge, and in order to attract them Hanns Sachs, in 1912, founded the periodical *Imago* which is edited by him and Rank. A beginning has been made by Hitschmann and von Winterstein in throwing psycho-analytic light on philosophical systems and personalities, and here there is much need both of extended and of deeper investigation.

The revolutionary discoveries of psycho-analysis in regard to the mental life of children - the part played in it by sexual impulses (von Hug-Hellmuth), and the fate of those components of sexuality which become unserviceable in the function of reproduction - were bound early to direct attention to education and to stimulate an attempt to bring analytic points of view into the foreground in that field of work. Recognition is due to Dr. Pfister for having, with sincere enthusiasm, initiated the application of psycho-analysis in this direction and brought it to the notice of ministers of religion and those concerned with education. (Cf. *The Psycho-Analytic Method*, 1913.) He has succeeded in gaining the sympathy and participation of a number of Swiss teachers in this. Other members of his profession are said to share his views but to have preferred nevertheless to remain cautiously in the background. In their retreat from psycho-analysis, a section of Vienna analysts seem to have arrived at a kind of combination of medicine and education.¹

¹ Adler and Furtmüller, *Heilen und Bilden* [*Healing and Educating*], 1914.

With this incomplete outline I have attempted to give some idea of the still incalculable wealth of connections which have come to light between medical psycho-analysis and other fields of science. There is material here for a generation of investigators to work at, and I do not doubt that the work will be carried out as soon as the resistances against psycho-analysis are overcome on its original ground.¹

To write the story of these resistances would, I think, be both fruitless and inopportune at the present time. The story is not very creditable to the scientific men of our day. But I must add at once that it has never occurred to me to pour contempt upon the opponents of psycho-analysis merely because they were opponents - apart from the few unworthy individuals, the adventurers and profiteers, who are always to be found on both sides in time of war. I knew very well how to account for the behaviour of these opponents and, moreover, I had learnt that psycho-analysis brings out the worst in everyone. But I made up my mind not to answer my opponents and, so far as my influence went, to restrain others from polemics. Under the peculiar conditions of the controversy over psycho-analysis it seemed to me very doubtful whether either public or written discussion would avail anything; it was certain which way the majority at congresses and meetings would go, and my faith in the reasonableness and good behaviour of the gentlemen who opposed me was not at any time great. Experience shows that only very few people are capable of remaining polite, to say nothing of objective, in a scientific dispute, and the impression made on me by scientific squabbles has always been odious. Perhaps this attitude on my part has been misunderstood; perhaps I have been thought so good-natured or so easily intimidated that no further notice need be taken of me. This was a mistake; I can be as abusive and enraged as anyone; but I have not the art of expressing the underlying emotions in a form suitable for publication and I therefore prefer to abstain completely.

¹ See my two articles in *Scientia* (1913).

Perhaps in some respects it would have been better if I had given free rein to my own passions and to those of others round me. We have all heard of the interesting attempt to explain psycho-analysis as a product of the Vienna milieu. As recently as in 1913 Janet was not ashamed to use this argument, although he himself is no doubt proud of being a Parisian, and Paris can scarcely claim to be a city of stricter morals than Vienna. The suggestion is that psycho-analysis, and in particular its assertion that the neuroses are traceable to disturbances in sexual life, could only have originated in a town like Vienna - in an atmosphere of sensuality and immorality foreign to other cities - and that it is simply a reflection, a projection into theory, as it were, of these peculiar Viennese conditions. Now I am certainly no local patriot; but this theory about psycho-analysis always seems to me quite exceptionally senseless - so senseless, in fact, that I have sometimes been inclined to suppose that the reproach of being a citizen of Vienna is only a euphemistic substitute for another reproach which no one would care to put forward openly. If the premisses on which the argument rests were the opposite of what they are, then it might be worth giving it a hearing. If there were a town in which the inhabitants imposed exceptional restrictions on themselves as regards sexual satisfaction, and if at the same time they exhibited a marked tendency to severe neurotic disorders, that town might certainly give rise in an observer's mind to the idea that the two circumstances had some connection with each other, and might suggest that one was contingent on the other. But neither of these assumptions is true of Vienna. The Viennese are no more abstinent and no more neurotic than the inhabitants of any other capital city. There is rather less embarrassment - less prudery - in regard to sexual relationships than in the cities of the West and North which are so proud of their chastity. These peculiar characteristics of Vienna would be more likely to mislead the observer on the causation of neurosis than to enlighten him on it.

Vienna has done everything possible, however, to deny her share in the origin of psycho-analysis. In no other place is the hostile indifference of the learned and educated section of the population so evident to the analyst as in Vienna.

It may be that my policy of avoiding wide publicity is to some extent responsible for this. If I had encouraged or allowed the medical societies of Vienna to occupy themselves with psycho-analysis in stormy debates which would have discharged all the passions and brought into the open all the reproaches and invectives that were on its opponents' tongues or in their hearts - then, perhaps, the ban on psycho-analysis would have been overcome by now and it would no longer be a stranger in its native city. As it is, the poet may be right when he makes his Wallenstein say:

Doch das vergeben mir die Wiener nicht,
dass ich um ein Spektakel sie betrog.¹

¹ [Literally: 'But what the Viennese will not forgive me is having cheated them out of a spectacle.']

The task to which I was not equal - that of demonstrating to the opponents of psycho-analysis *suaviter in modo* their injustice and arbitrariness - was undertaken and carried out most creditably by Bleuler in a paper written in 1910, 'Freud's Psycho-Analysis: A Defence and Some Critical Remarks'. It would seem so natural for me to praise this work (which offers criticisms in both directions) that I will hasten to say what I take exception to in it. It seems to me still to display partiality, to be too lenient to the faults of the opponents of psycho-analysis and too severe on the shortcomings of its adherents. this trait in it may possibly explain why the opinion of a psychiatrist of such high repute, such undoubted ability and independence, failed to carry more weight with his colleagues. The author of *Affectivity* (1906) ought not to be surprised if the influence of a work is determined not by the strength of its arguments but by its affective tone. Another part of its influence - its influence on the followers of psycho-analysis - was destroyed later by Bleuler himself, when in 1913 he showed the reverse side of his attitude to psycho-analysis in his 'Criticism of the Freudian Theory'. In that paper he subtracts so much from the structure of psycho-analytic theory that our opponents may well be glad of the help given them by this champion of psycho-analysis. These adverse judgements of Bleuler's, however, are not based on new arguments or better observations. They rely simply on the state of his own knowledge, the inadequacy of which he no longer himself admits, as he did in his earlier works. It seemed therefore that an almost irreparable loss threatened psycho-analysis here. But in his last publication, 'Criticisms of my *Schizophrenia*' (1914), Bleuler rallies his forces in the face of the attacks made on him for having introduced psycho-analysis into his book on schizophrenia, and makes what he himself calls a 'presumptuous claim'. 'But now I will make a presumptuous claim: I consider that up to the present the various schools of psychology have contributed extremely little towards explaining the nature of psychogenic symptoms and diseases, but that depth-psychology offers something towards a psychology which still awaits creation and which physicians are in need of in order to understand their patients and to cure them rationally; and I even believe that in my *Schizophrenia* I have taken a very short step towards that understanding. The first two assertions are certainly correct; the last may be an error.'

Since by 'depth-psychology' he means nothing else but psycho-analysis, we may for the present be content with this acknowledgment.

III

*Mach es kurz!
Am Jüngsten Tag ist's nur ein Furz!*¹

GOETHE

Two years after the first private Congress of psycho-analysts the second took place, this time at Nuremberg, in March, 1910. In the interval between them, influenced partly by the favourable reception in America, by the increasing hostility in German-speaking countries, and by the unforeseen acquisition of support from Zurich, I had conceived a project which with the help of my friend Ferenczi I carried out at this second Congress. What I had in mind was to organize the psycho-analytic movement, to transfer its centre to Zurich and to give it a chief who would look after its future career. As this scheme has met with much opposition among the adherents of psycho-analysis, I will set out my reasons for it in some detail. I hope that these will justify me, even though it turns out that what I did was in fact not very wise.

I judged that the new movement's association with Vienna was no recommendation but rather a handicap to it. A place in the heart of Europe like Zurich, where an academic teacher had opened the doors of his institution to psycho-analysis, seemed to me much more promising. I also took it that a second handicap lay in my own person, opinion about which was too much confused by the liking or hatred of the different sides: I was either compared to Columbus, Darwin and Kepler, or abused as a general paralytic. I wished, therefore, to withdraw into the background both myself and the city where psycho-analysis first saw the light. Moreover, I was no longer young; I saw that there was a long road ahead, and I felt oppressed by the thought that the duty of being a leader should fall to me so late in life. Yet I felt that there must be someone at the head. I knew only too well the pitfalls that lay in wait for anyone who became engaged in analysis, and hoped that many of them might be avoided if an authority could be set up who would be prepared to instruct and admonish. This position had at first been occupied by myself, owing to my fifteen years' start in experience which nothing could counterbalance. I felt the need of transferring this authority to a younger man, who would then as a matter of course take my place after my death. This man could only be C. G. Jung, since Bleuler was my contemporary in age; in favour of Jung were his exceptional talents, the contributions he had already made to psycho-analysis, his independent position and the impression of assured energy which his personality conveyed. In addition to this, he seemed ready to enter into a friendly relationship with me and for my sake to give up certain racial prejudices which he had previously permitted himself. I had no inkling at that time that in spite of all these advantages the choice was a most unfortunate one, that I had lighted upon a person who was incapable of tolerating the authority of another, but who was still less capable of wielding it himself, and whose energies were relentlessly devoted to the furtherance of his own interests.

I considered it necessary to form an official association because I feared the abuses to which psycho-analysis would be subjected as soon as it became popular. There should be some headquarters whose business it would be to declare: 'All this nonsense is nothing to do with analysis; this is not psycho-analysis.' At the sessions of the local groups (which together would constitute the international association) instruction should be given as to how psycho-analysis was to be conducted and doctors should be trained, whose activities would then receive a kind of guarantee. Moreover, it seemed to me desirable, since official science had pronounced its solemn ban upon psycho-analysis and had declared a boycott against doctors and institutions practising it, that the adherents of psycho-analysis should come together for friendly communication with one another and mutual support.

¹ [Literally: 'Cut it short! On the Day of Judgement it is no more than a fart.']

This and nothing else was what I hoped to achieve by founding the 'International Psycho-Analytical Association'. It was probably more than could be attained. Just as my opponents were to discover that it was not possible to stem the tide of the new movement, so I was to find that it would not proceed in the direction I wished to mark out for it. The proposals made by Ferenczi in Nuremburg were adopted, it is true; Jung was elected President and made Riklin his Secretary; the publication of a bulletin which should link the Central Executive with the local groups was resolved upon. The object of the Association was declared to be 'to foster and further the science of psycho-analysis founded by Freud, both as pure psychology and in its application to medicine and the mental sciences; and to promote mutual support among its members in all endeavours to acquire and to spread psycho-analytic knowledge'. The scheme was strongly opposed only by the Vienna group. Adler, in great excitement, expressed the fear that 'censorship and restrictions on scientific freedom' were intended. Finally the Viennese gave in, after having secured that the seat of the Association should be not Zurich, but the place of residence of the President for the time being, who was to be elected for two years.

At this Congress three local groups were constituted: one in Berlin, under the chairmanship of Abraham; one in Zurich, whose head had become the President of the whole Association; and one in Vienna, the direction of which I made over to Adler. A fourth group, in Budapest, could not be formed until later. Bleuler had not attended the Congress on account of illness, and later he evinced hesitation about joining the Association on general grounds; he let himself be persuaded to do so, it is true, after a personal conversation with me, but resigned again shortly afterwards as a result of disagreements in Zurich. This severed the connection between the Zurich local group and the Burghölzli institution.

One outcome of the Nuremberg Congress was the founding of the *Zentralblatt für Psychoanalyse* [*Central Journal for Psycho-analysis*], for which purpose Adler and Stekel joined forces. It was obviously intended originally to represent the Opposition: it was meant to win back for Vienna the hegemony threatened by the election of Jung. But when the two founders of the journal, labouring under the difficulties of finding a publisher, assured me of their peaceful intentions and as a guarantee of their sincerity gave me a right of veto, I accepted the direction of it and worked energetically for the new organ; its first number appeared in September, 1910.

I will now continue the story of the Psycho-Analytical Congresses. The third Congress took place in September, 1911, at Weimar, and was even more successful than the previous ones in its general atmosphere and scientific interest. J. J. Putnam, who was present on this occasion, declared afterwards in America how much pleasure it had given him and expressed his respect for 'the mental attitude' of those who attended it, quoting some words I was said to have used in reference to them: 'They have learnt to tolerate a bit of truth.' (Putnam 1912.) It is a fact that no one who had attended scientific congresses could have failed to carry away a favourable impression of the Psycho-Analytical Association. I myself had conducted the first two Congresses and I had allowed every speaker time for his paper, leaving discussions to take place in private afterwards among the members. Jung, as President, took over the direction at Weimar and re-introduced formal discussions after each paper, which, however, did not give rise to any difficulties as yet.

A very different picture was presented by the fourth Congress, held in Munich two years later, in September, 1913. It is still fresh in the memory of all who were present. It was conducted by Jung in a disagreeable and incorrect manner; the speakers were restricted in time and the discussions overwhelmed the papers. By a malicious stroke of chance it happened that that evil genius, Hoche, had settled in the very building in which the meetings were held. Hoche would have had no difficulty in convincing himself of the nonsense which the analysts made of his description of them as a fanatical sect blindly submissive to their leader. The fatiguing and unedifying proceedings ended in the re-election of Jung to the Presidency of the International Psycho-Analytical Association, which he accepted, although two-fifths of those present refused him their support. We dispersed without any desire to meet again.

At about the time of this Congress the strength of the International Psycho-Analytical Association was as follows. The local groups in Vienna, Berlin and Zurich had been formed at the Congress in Nuremberg as early as 1910. In May, 1911, a group at Munich under the chairmanship of Dr. L. Seif was added. In the same year the first American local group was formed under the chairmanship of A. A. Brill, with the name 'The New York Psychoanalytic Society'. At the Weimar Congress the foundation of a second American group was authorized; it came into existence during the following year under the name of 'The American Psychoanalytic Association', and included members from Canada and the whole of America; Putnam was elected President and Ernest Jones Secretary. Shortly before the Congress in Munich in 1913, the Budapest local group was formed under the chairmanship of Ferenczi. Soon after this the first English group was formed by Ernest Jones, who had returned to London. The membership of these local groups, of which there were now eight, naturally affords no means of estimating the number of unorganized students and adherents of psycho-analysis.

The development of the periodicals devoted to psycho-analysis also deserves a brief mention. The first of these was a series of monographs entitled *Schriften zur angewandten Seelenkunde* ['Papers on Applied Mental Science'] which have appeared irregularly since 1907 and now number fifteen issues. (The publisher was to begin with Heller in Vienna and later F. Deuticke.) They comprise works by Freud (Nos. 1 and 7), Riklin, Jung, Abraham (Nos. 4 and 11), Rank (Nos. 5 and 13), Sadger, Pfister, Max Graf, Jones (Nos. 10 and 14), Storfer and von Hug-Hellmuth.¹ When the journal *Imago* (which will be referred to shortly) was founded, this form of publication ceased to have quite the same value. After the meeting at Salzburg in 1908, the *Jahrbuch für psychoanalytische und psychopathologische Forschungen* [*Yearbook for Psycho-Analytic and Psychopathological Researches*] was founded, which appeared for two years under Jung's editorship and has now re-emerged, under two new editors and with a slight change in its title, as the *Jahrbuch der Psychoanalyse* [*Yearbook of Psycho-Analysis*]. It is no longer intended to be, as it has been in recent years, merely repository for the publication of self-contained works. Instead it will endeavour, through the activity of its editors, to fulfil the aim of recording all the work done and all the advances made in the sphere of psycho-analysis.² The *Zentralblatt für Psychoanalyse*, which, as I have already said, was started by Adler and Stekel after the foundation of the International Psycho-Analytical Association in Nuremberg in 1910, has, during its short existence, had a stormy career. As early as in the tenth number of the first volume an announcement appeared on the front page that, on account of scientific differences of opinion with the director, Dr. Alfred Adler had decided to withdraw voluntarily from the editorship. After this Dr. Stekel remained the only editor (from the summer of 1911). At the Weimar Congress the *Zentralblatt* was raised to the position of official organ of the International Association and made available to all members in return for an increase in the annual subscription. From the third number of the second volume onwards (winter, 1912) Stekel became solely responsible for its contents. His behaviour, of which it is not easy to publish an account, had compelled me to resign the direction and hurriedly to establish a new organ for psycho-analysis - the *Internationale Zeitschrift für ärztliche Psychoanalyse* [*International Journal for Medical Psycho-Analysis*]. The combined efforts of almost all our workers and of Hugo Heller, the new publisher, resulted in the appearance of the first number in January, 1913, whereupon it took the place of the *Zentralblatt* as official organ of the International Psycho-Analytical Association.

¹ [Footnote added 1924:] Since then, further works have appeared, by Sadger (Nos. 16 and 18) and Kielholz (No. 17).

² [Footnote added 1924:] It ceased publication at the beginning of the War.

Meanwhile, early in 1912, a new periodical, *Imago* (published by Heller), designed exclusively for the application of psycho-analysis to the mental sciences, was founded by Dr. Hanns Sachs and Dr. Otto Rank. *Imago* is now in the middle of its third volume and is read with interest by a continually increasing number of subscribers, some of whom have little connection with medical analysis.¹

Apart from these four periodical publications (*Schriften zur angewandten Seelenkunde*, *Jahrbuch*, *Zeitschrift* and *Imago*) other German and foreign journals publish works which may claim a place in the literature of psycho-analysis. *The Journal of Abnormal Psychology*, directed by Morton Prince, usually contains so many good analytic contributions that it must be regarded as the principal representative of analytic literature in America. In the winter of 1913, White and Jelliffe in New York started a new periodical (*The Psychoanalytic Revue*) which is devoted exclusively to psycho-analysis, no doubt bearing in mind the fact that most medical men in America who are interested in analysis find the German language a difficulty.²

I must now mention two secessions which have taken place among the adherents of psycho-analysis; the first occurred between the founding of the Association in 1910 and the Weimar Congress in 1911; the second took place after this and became manifest at Munich in 1913. The disappointment that they caused me might have been averted if I had paid more attention to the reactions of patients under analytic treatment. I knew very well of course that anyone may take to flight at his first approach to the unwelcome truths of analysis; I had always myself maintained that everyone's understanding of it is limited by his own repressions (or rather, by the resistances which sustain them) so that he cannot go beyond a particular point in his relation to analysis. But I had not expected that anyone who had reached a certain depth in his understanding of analysis could renounce that understanding and lose it. And yet daily experience with patients had shown that total rejection of analytic knowledge may result whenever a specially strong resistance arises at any depth in the mind; one may have succeeded in laboriously bringing a patient to grasp some parts of analytic knowledge and to handle them like possessions of his own, and yet one may see him, under the domination of the very next resistance, throw all he has learnt to the winds and stand on the defensive as he did in the days when he was a carefree beginner. I had to learn that the very same thing can happen with psycho-analysts as with patients in analysis.

¹ [Footnote added 1924:] The publication of these two periodicals was transferred in 1919 to the Internationaler Psychoanalytischer Verlag [the International Psycho-Analytical Publishing House]. At the present time (1923) they are both in their ninth volume. (Actually, *Internationale Zeitschrift* is in the eleventh and *Imago* in the twelfth year of its existence, but, in consequence of events during the war, Volume IV of the *Zeitschrift* covered more than one year, i.e. the years 1916-18, and Volume V of *Imago* the years 1917-18.) With the beginning of Volume VI the word 'ärztliche' ['medical'] was dropped from the title of the *Internationale Zeitschrift*.

² [Footnote added 1924:] In 1920 Ernest Jones undertook the founding of *The International Journal of Psycho-Analysis*, intended for readers in England and America.

It is no easy or enviable task to write the history of these two secessions, partly because I am without any strong personal motive for doing so - I had not expected gratitude nor am I revengeful to any effective degree - and partly because I know that by doing so I shall lay myself open to the invectives of my not too scrupulous opponents and offer the enemies of analysis the spectacle they so heartily desire - of 'the psycho-analysts tearing one another limb from limb'. After exercising so much self-restraint in not coming to blows with opponents outside of analysis, I now see myself compelled to take up arms against its former followers or people who still like to call themselves its followers. I have no choice in the matter, however; only indolence or cowardice could lead one to keep silence, and silence would cause more harm than a frank revelation of the harms that already exist. Anyone who has followed the growth of other scientific movements will know that the same upheavals and dissensions commonly occur in them as well. It may be that elsewhere they are more carefully concealed; but psycho-analysis, which repudiates so many conventional ideals, is more honest in these matters too.

Another very severe drawback is that I cannot entirely avoid throwing some analytic light on these two opposition movements. Analysis is not suited, however, for polemical use; it presupposes the consent of the person who is being analysed and a situation in which there is a superior and a subordinate. Anyone, therefore, who undertakes an analysis for polemical purposes must expect the person analysed to use analysis against him in turn, so that the discussion will reach a state which entirely excludes the possibility of convincing any impartial third person. I shall therefore restrict to a minimum my use of analytic knowledge, and, with it, of indiscretion and aggressiveness towards my opponents; and I may also point out that I am not basing any scientific criticism on these grounds. I am not concerned with the truth that may be contained in the theories which I am rejecting, nor shall I attempt to refute them. I shall leave that task to other qualified workers in the field of psycho-analysis, and it has, indeed, already been partly accomplished. I wish merely to show that these theories controvert the fundamental principles of analysis (and on what points they controvert them) and that for this reason they should not be known by the name of analysis. So I shall avail myself of analysis only in order to explain how these divergences from it could arise among analysts. When I come to the points at which the divergences occurred, I shall have, it is true, to defend the just rights of psycho-analysis with some remarks of a purely critical nature.

The first task confronting psycho-analysis was to explain the neuroses; it used the two facts of resistance and transference as starting-points, and, taking into consideration the third fact of amnesia, accounted for them with its theories of repression, of the sexual motive forces in neurosis and of the unconscious. Psycho-analysis has never claimed to provide a complete theory of human mentality in general, but only expected that what it offered should be applied to supplement and correct the knowledge acquired by other means. Adler's theory, however, goes far beyond this point; it seeks at one stroke to explain the behaviour and character of human beings as well as their neurotic and psychotic illnesses. It is actually more suited to any other field than that of neurosis, although for reasons connected with the history of its development it still places this in the foreground. For many years I had opportunities of studying Dr. Adler and have never refused to recognize his unusual ability, combined with a particularly speculative disposition. As an instance of the 'persecution' to which he asserts he has been subjected by me, I can point to the fact that after the Association was founded I made over to him the leadership of the Vienna group. It was not until urgent demands were put forward by all the members of the society that I let myself be persuaded to take the chair again at its scientific meetings. When I perceived how little gift Adler had precisely for judging unconscious material, my view changed to an expectation that he would succeed in discovering the connections of psycho-analysis with psychology and with the biological foundations of instinctual processes - an expectation which was in some sense justified by the valuable work he had done on 'organ-inferiority'. And he did in fact effect something of the kind; but his work conveys an impression 'as if' - to speak in his own 'jargon' - it was intended to prove that psycho-analysis was wrong in everything and that it had only attributed so much importance to sexual motive forces because of its credulity in accepting the assertions of neurotics. I may even speak publicly of the personal motive for his work, since he himself announced it in the presence of a small circle of members of the Vienna group: - 'Do you think it gives me such great pleasure to stand in your shadow my whole life long?' To be sure, I see nothing reprehensible in a younger man freely admitting his ambition, which one would in any case guess was among the incentives for his work. But even though a man is dominated by a motive of this kind he should know how to avoid being what the English, with their fine social tact, call 'unfair' - which in German can only be expressed by a much cruder word. How little Adler has succeeded in this is shown by the profusion of petty outbursts of malice which disfigure his writings and by the indications they contain of an uncontrolled craving for priority. At the Vienna Psycho-Analytical Society we once actually heard him claim priority for the conception of the 'unity of the neuroses' and for the 'dynamic view' of them. This came as a great surprise to me, for I had always believed that these two principles were stated by me before I ever made Adler's acquaintance.

This striving of Adler's for a place in the sun has, however, had one result which is bound to be beneficial to psycho-analysis. When, after irreconcilable scientific disagreements had come to light, I was obliged to bring about Adler's resignation from the editorship of the *Zentralblatt*, he left the Vienna society as well, and founded a new one, which at first adopted the tasteful name of 'The Society for Free Psycho-Analysis' [*Verein für freie Psychoanalyse*]. But outsiders who are unconnected with analysis are evidently as unskilful in appreciating the differences between the views of two psycho-analysts as we Europeans are in detecting the differences between two Chinese faces. 'Free' psycho-analysis remained in the shadow of 'official', 'orthodox' psycho-analysis and was treated merely as an appendage to the latter. Then Adler took a step for which we are thankful; he severed all connection with psycho-analysis, and gave his theory the name of 'Individual Psychology'. There is room enough on God's earth, and anyone who can has a perfect right to potter about on it without being prevented; but it is not a desirable thing for people who have ceased to understand one another and have grown incompatible with one another to remain under the same roof. Adler's 'Individual Psychology' is now one of the many schools of psychology which are adverse to psycho-analysis and its further development is no concern of ours.

The Adlerian theory was from the very beginning a 'system' - which psycho-analysis was careful to avoid becoming. It is also a remarkably good example of 'secondary revision', such as occurs, for instance, in the process to which dream-material is submitted by the action of waking thought. In Adler's case the place of dream-material is taken by the new material obtained through psycho-analytic studies; this is then viewed purely from the standpoint of the ego, reduced to the categories with which the ego is familiar, translated, twisted and - exactly as happens in dream-formation - is misunderstood. Moreover, the Adlerian theory is characterized less by what it asserts than by what it denies, so that it consists of three sorts of elements of quite dissimilar value: useful contributions to the psychology of the ego, superfluous but admissible translations of the analytic facts into the new 'jargon', and distortions and perversions of these facts when they do not comply with the requirements of the ego.

The elements of the first sort have never been ignored by psycho-analysis, although they did not deserve any special attention from it; it was more concerned to show that every ego-trend contains libidinal components. The Adlerian theory emphasises the counterpart to this, the egoistic constituent in libidinal instinctual impulses. This would have been an appreciable gain if Adler had not on every occasion used this observation in order to deny the libidinal impulses in favour of their egoistic instinctual components. His theory does what every patient does and what our conscious thought in general does - namely, makes use of a *rationalization*, as Jones has called it, in order to conceal the unconscious motive. Adler is so consistent in this that he positively considers that the strongest motive force in the sexual act is the man's intention of showing himself master of the woman - of being 'on top'. I do not know if he has expressed these monstrous notions in his writings.

Psycho-analysis recognized early that every neurotic symptom owes its possibility of existence to a compromise. Every symptom must therefore in some way comply with the demands of the ego which manipulates the repression; it must offer some advantage, it must admit of some useful application, or it would meet with the same fate as the original instinctual impulse itself which has been fended off. The term 'gain from illness' has taken this into account; one is even justified in differentiating the 'primary' gain to the ego, which must be operative at the time of the generation of the symptom, from a 'secondary' part, which supervenes in attachment to other purposes of the ego, if the symptom is to persist. It has also long been known that the withdrawal of this gain from illness, or its disappearance in consequence of some change in real external circumstances, constitutes one of the mechanisms of a cure of the symptom. In the Adlerian doctrine the main emphasis falls on these easily verifiable and clearly intelligible connections, while the fact is altogether overlooked that on countless occasions the ego is merely making a virtue of necessity in submitting, because of its usefulness, to the very disagreeable symptom which is forced upon it - for instance, in accepting anxiety as a means to security. The ego is here playing the ludicrous part of the clown in a circus who by his gestures tries to convince the audience that every change in the circus ring is being carried out under his orders. But only the youngest of the spectators are deceived by him.

Psycho-analysis is obliged to give its backing to the second constituent of Adler's theory as it would to something of its own. And in fact it is nothing else than psycho-analytic knowledge, which that author extracted from sources open to everyone during ten years of work in common and which he has now labelled as his own by a change in nomenclature. I myself consider 'safeguarding [*Sicherung*]', for instance, a better term than 'protective measure [*Schutzmassregel*]' which is the one I employ; but I cannot discover any difference in their meaning. Again, a host of familiar features come to light in Adler's propositions when one restores the earlier 'phantasied' and 'phantasy' in place of 'feigned [*fingiert*]', 'fictive' and 'fiction'. The identity of these terms would be insisted upon by psycho-analysis even if their author had not taken part in our common work over a period of many years.

The third part of the Adlerian theory, the twisted interpretations and distortions of the disagreeable facts of analysis, are what definitely separate 'Individual Psychology', as it is now to be called, from psycho-analysis. As we know, the principle of Adler's system is that the individual's aim of self-assertion, his 'will to power', is what, in the form of a 'masculine protest', plays a dominating part in the conduct of life, in character-formation and in neurosis. This 'masculine protest', the Adlerian motive force, is nothing else, however, but repression detached from its psychological mechanism and, moreover, sexualized in addition - which ill accords with the vaunted ejection of sexuality from its place in mental life. The 'masculine protest' undoubtedly exists, but if it is made into the motive force of mental life the observed facts are being treated like a spring-board that is left behind after it has been used to jump off from. Let us consider one of the fundamental situations in which desire is felt in infancy: that of a child observing the sexual act between adults. Analysis shows, in the case of people with whose life-story the physician will later be concerned, that at such moments two impulses take possession of the immature spectator. In boys, one is the impulse to put himself in the place of the active man, and the other, the opposing current, is the impulse to identify himself with the passive woman. Between them these two impulses exhaust the pleasurable possibilities of the situation. The first alone can come under the head of the masculine protest, if that concept is to retain any meaning at all. The second, however, the further course of which Adler disregards or which he knows nothing about, is the one that will become the more important in the subsequent neurosis. Adler has so merged himself in the jealous narrowness of the ego that he takes account only of those instinctual impulses which are agreeable to the ego and are encouraged by it; the situation in neurosis, in which the impulses are *opposed* to the ego, is precisely the one that lies beyond his horizon.

In connection with the attempt, which psycho-analysis has made necessary, to correlate the fundamental principle of its theory with the mental life of children, Adler exhibits the most serious departures from actual observation and the most fundamental confusion in his concepts. The biological, social and psychological meanings of 'masculine' and 'feminine' are here hopelessly mixed. It is impossible, and is disproved by observation, that a child, whether male or female, should found the plan of its life on an original depreciation of the female sex and take the wish to be a real man as its 'guiding line'. Children have, to begin with, no idea of the significance of the distinction between the sexes; on the contrary, they start with the assumption that the same genital organ (the male one) is possessed by both sexes; they do not begin their sexual researches with the problem of the distinction between the sexes, while the *social* underestimation of women is completely foreign to them. There are women in whose neurosis the wish to be a man has played no part. Whatever in the nature of a masculine protest can be shown to exist is easily traceable to a disturbance in primary narcissism due to threats of castration or to the earliest interferences with sexual activities. All disputes about the psychogenesis of the neuroses must eventually be decided in the field of the neuroses of childhood. Careful dissection of a neurosis in early childhood puts an end to all misapprehensions about the aetiology of the neuroses and to all doubts about the part played by the sexual instincts in them. That is why, in his criticism of Jung's paper 'Conflicts in the Mind of the Child', Adler was obliged to resort to the imputation that the facts of the case had been one-sidedly arranged, 'no doubt by the father'.

I will not dwell any longer on the biological aspect of the Adlerian theory nor discuss whether either actual 'organ-inferiority' or the subjective feeling of it - one does not know which - is really capable of serving as the foundation of Adler's system. I will merely remark in passing that if it were so neurosis would appear as a by-product of every kind of physical decrepitude, whereas observation shows that an impressive majority of ugly, misshapen, crippled and miserable people fail to react to their defects by neurosis. Nor will I deal with the interesting assertion according to which inferiority is to be traced back to the feeling of being a child. It shows the disguise under which the factor of infantilism, which is so strongly emphasized by psycho-analysis, re-appears in 'Individual Psychology'. On the other hand, I must point out how all the psychological acquisitions of psycho-analysis have been thrown to the winds by Adler. In his book *Über den nervösen Charakter* the unconscious is still mentioned as a psychological peculiarity, without, however, any relation to his system. Later, he has consistently declared that it is a matter of indifference to him whether an idea is conscious or unconscious. Adler has never from the first shown any understanding of repression. In an abstract of a paper read by him at the Vienna Society (February, 1911) he wrote that it must be pointed out that the evidence in a particular case showed that the patient had never repressed his libido, but had been continually 'safeguarding' himself against it. Soon afterwards, in a discussion at the Vienna Society, he said: 'If you ask where repression comes from, you are told, "from civilization"; but if you go on to ask where civilization comes from, you are told "from repression"'. So you see it is all simply playing with words.' A title of the acuteness and ingenuity with which Adler has unmasked the defensive devices of the 'nervous character' would have been enough to show him the way out of this pettifogging argument. What is meant is simply that civilization is based on the repressions effected by former generations, and that each fresh generation is required to maintain this civilization by effecting the same repressions. I once heard of a child who thought people were laughing at him, and began to cry, because when he asked where eggs come from he was told 'from hens', and when he went on to ask where hens come from he was told 'from eggs'. But they were not playing with words; on the contrary, they were telling him the truth.

Everything that Adler has to say about dreams, the shibboleth of psycho-analysis, is equally empty and unmeaning. At first he regarded dreams as a turning away from the feminine to the masculine line - which is simply a translation of the wish-fulfilment theory of dreams into the language of the 'masculine protest'. Later he found that the essence of dreams lies in enabling men to accomplish unconsciously what they are denied consciously. Adler must also be credited with priority in confusing dreams with latent dream-thoughts - a confusion on which the discovery of his 'prospective tendency' rests. Maeder followed his lead in this later. Here the fact is readily overlooked that every interpretation of a dream which is incomprehensible in its manifest form is based on the very method of dream-interpretation whose premisses and conclusions are being disputed. In regard to resistance Adler informs us that it serves the purpose of putting into effect the patient's opposition to the physician. This is certainly true; it is as much as to say that it serves the purpose of resistance. Where it comes from, however, or how it happens that its phenomena are at the disposal of the patient is not further enquired into, as being of no interest to the ego. The detailed mechanism of the symptoms and manifestations of diseases, the explanation of the manifold variety of those diseases and their forms of expression, are disregarded *in toto*; for everything alike is pressed into the service of the masculine protest, self-assertion and the aggrandizement of the personality. the system is complete; to produce it has cost an enormous amount of labour in the recasting of interpretations, while it has not furnished a single new observation. I fancy I have made it clear that it has nothing to do with psycho-analysis.

The view of life which is reflected in the Adlerian system is founded exclusively on the aggressive instinct; there is no room in it for love. We might feel surprise that such a cheerless *Weltanschauung* should have met with any attention at all; but we must not forget that human beings, weighed down by the burden of their sexual needs, are ready to accept anything if only the 'overcoming of sexuality' is offered them as a bait.

Adler's secession took place before the Weimar Congress in 1911; after that date the Swiss began theirs. The first signs of it, curiously enough, were a few remarks of Riklin's in some popular articles appearing in Swiss publications, so that the general public learned earlier than those most intimately concerned in the subject that psycho-analysis had got the better of some regrettable errors which had previously discredited it. In 1912 Jung boasted, in a letter from America, that his modifications of psycho-analysis had overcome the resistances of many people who had hitherto refused to have anything to do with it. I replied that that was nothing to boast of, and that the more he sacrificed of the hard-won truths of psycho-analysis the more would he see resistances vanishing. This modification which the Swiss were so proud of introducing was again nothing else but a pushing into the background of the sexual factor in psycho-analytic theory. I confess that from the beginning I regarded this 'advance' as too far-reaching an adjustment to the demands of actuality.

These two retrograde movements away from psycho-analysis, which I must now compare with each other, show another point in common: for they both court a favourable opinion by putting forward certain lofty ideas, which view things, as it were, *sub specie aeternitatis*. With Adler, this part is played by the relativity of all knowledge and the right of the personality to put an artificial construction on the data of knowledge according to individual taste; with Jung, the appeal is made to the historic right of youth to throw off the fetters in which tyrannical age with its hidebound views seeks to bind it. A few words must be devoted to exposing the fallacy of these ideas.

The relativity of our knowledge is a consideration which may be advanced against every other science just as well as against psycho-analysis. It is derived from familiar reactionary currents of present-day feeling which are hostile to science, and it lays claim to an appearance of superiority to which no one is entitled. None of us can guess what the ultimate judgement of mankind about our theoretical efforts will be. There are instances in which rejection by the first three generations has been corrected by the succeeding one and changed into recognition. After a man has listened carefully to the voice of criticism in himself and has paid some attention to the criticisms of his opponents, there is nothing for him to do but with all his strength to maintain his own convictions which are based of experience. One should be content to conduct one's case honestly, and should not assume the office of judge, which is reserved for the remote future. The stress on arbitrary personal views in scientific matters is bad; it is clearly an attempt to dispute the right of psycho-analysis to be valued as a science - after that value, incidentally, has already been depreciated by what has been said before. Anyone who sets a high value on scientific thought will rather seek every possible means and method of circumscribing the factor of fanciful personal predilections as far as possible wherever it still plays too great a part. Moreover, it is opportune to recall that any zeal in defending ourselves is out of place. These arguments of Adler's are not intended seriously. They are only meant for use against his opponents; they do not touch his own theories. Nor have they prevented his followers from hailing him as the Messiah, for whose appearance expectant humanity has been prepared by a number of forerunners. The Messiah is certainly no relative phenomenon.

Jung's argument *ad captandam benevolentiam*¹ rests on the too optimistic assumption that the progress of the human race, of civilization and knowledge, has always pursued an unbroken one; as if there had been no periods of decadence, no reactions and restorations after every revolution, no generations who have taken a backward step and abandoned the gains of their predecessors. His approach to the standpoint of the masses, his abandonment of an innovation which proved unwelcome, make it *a priori* improbable that Jung's corrected version of psycho-analysis can justly claim to be a youthful act of liberation. After all, it is not the age of the doer that decides this but the character of the deed.

¹ ['For the purpose of gaining good-will.']

Of the two movements under discussion Adler's is indubitably the more important; while radically false, it is marked by consistency and coherence. It is, moreover, in spite of everything, founded upon a theory of the instincts. Jung's modification, on the other hand, loosens the connection of the phenomena with instinctual life; and further, as its critics (e.g. Abraham, Ferenczi and Jones) have pointed out, it is so obscure, unintelligible and confused as to make it difficult to take up any position upon it. Wherever one lays hold of anything, one must be prepared to hear that one has misunderstood it, and one cannot see how to arrive at a correct understanding of it. It is put forward in a peculiarly vacillating manner, one moment as 'quite a mild deviation, which does not justify the outcry that has been raised about it' (Jung), and the next moment as a new message of salvation which is to begin a new epoch for psycho-analysis, and, indeed, a new *Weltanschauung* for everyone.

When one thinks of the inconsistencies displayed in the various public and private pronouncements made by the Jungian movement, one is bound to ask oneself how much of this is due to lack of clearness and how much to lack of sincerity. It must be admitted, however, that the exponents of the new theory find themselves in a difficult position. They are now disputing things which they themselves formerly upheld, and they are doing so, moreover, not on the ground of fresh observations which might have taught them something further, but in consequence of fresh interpretations which make the things they see look different to them now from what they did before. For this reason they are unwilling to give up their connection with psycho-analysis, as whose representatives they became known to the world, and prefer to give it out that psycho-analysis has changed. At the Munich Congress I found it necessary to clear up this confusion, and I did so by declaring that I did not recognize the innovations of the Swiss as legitimate continuations and further developments of the psycho-analysis that originated with me. Outside critics (like Furtmüller) had already seen how things were, and Abraham is right in saying that Jung is in full retreat from psycho-analysis. I am of course perfectly ready to allow that everyone has a right to think and to write what he pleases; but he has no right to put it forward as something other than what it really is.

Just as Adler's investigation brought something new to psycho-analysis - a contribution to the psychology of the ego - and then expected us to pay too high a price for this gift by throwing over all the fundamental theories of analysis, so in the same way Jung and his followers paved the way for their fight against psycho-analysis by presenting it with a new acquisition. They traced in detail (as Pfister did before them) the way in which the material of sexual ideas belonging to the family-complex and incestuous object-choice is made use of in representing the highest ethical and religious interests of man - that is, they have illuminated an important instance of the sublimation of the erotic instinctual forces and of their transformation into trends which can no longer be called erotic. This was in complete harmony with all the expectations of psycho-analysis, and would have agreed very well with the view that in dreams and neurosis a regressive dissolution of this sublimation, as of all others, becomes visible. But the world would have risen in indignation and protested that ethics and religion were being sexualized. Now I cannot refrain from thinking teleologically for once and concluding that these discoverers were not equal to meeting such a storm of indignation. Perhaps it even began to rage in their own bosoms. The theological prehistory of so many of the Swiss throws no less light on their attitude to psycho-analysis than does Adler's socialist prehistory on the development of his psychology. One is reminded of Mark Twain's famous story of all the things that happened to his watch and of his concluding words: 'And he used to wonder what became of all the unsuccessful tinkers, and gunsmiths, and shoemakers, and blacksmiths; but nobody could ever tell him.'

Suppose - to make use of a simile - that in a particular social group there lives a *parvenu*, who boasts of being descended from a noble family living in another place. It is pointed out to him, however, that his parents live somewhere in the neighbourhood, and that they are quite humble people. There is only one way of escape from his difficulty and he seizes on it. He can no longer repudiate his parents, but he asserts that they themselves are of noble lineage and have merely come down in the world; and he procures a family-tree from some obliging official source. It seems to me that the Swiss have been obliged to behave in much the same way. If ethics and religion were not allowed to be sexualized but had to be something 'higher' from the start, and if nevertheless the ideas contained in them seemed undeniably to be descended from the Oedipus and family-complex, there could be only one way out: it must be that from the very first these complexes themselves do not mean what they seem to be expressing, but bear the higher 'anagogic' meaning (as Silberer calls it) which made it possible for them to be employed in the abstract trains of thought of ethics and religious mysticism.

I am quite prepared to be told again that I have misunderstood the substance and purpose of the Neo-Zurich theory; but I must protest in advance against any contradictions to my view of it that may be found in the publications of that school being laid at my door instead of theirs. I can find no other way of making the whole range of Jung's innovations intelligible to myself and of grasping all their implications. All the changes that Jung has proposed to make in psycho-analysis flow from his intention to eliminate what is objectionable in the family-complexes, so as not to find it again in religion and ethics. For sexual libido an abstract concept has been substituted, of which one may safely say that it remains mystifying and incomprehensible to wise men and fools alike. The Oedipus complex has a merely 'symbolic' meaning: the mother in it means the unattainable, which must be renounced in the interests of civilization; the father who is killed in the Oedipus myth is the 'inner' father, from whom one must set oneself free in order to become independent. Other parts of the material of sexual ideas will no doubt be subjected to similar re-interpretations in the course of time. In the place of a conflict between ego-dystonic erotic trends and the self-preservative ones a conflict appears between the 'life-task' and 'psychical inertia'; the neurotic's sense of guilt corresponds to his self-reproach for not properly fulfilling his 'life-task'. In this way a new religio-ethical system has been created, which, just like the Adlerian system, was bound to re-interpret, distort or jettison the factual findings of analysis. The truth is that these people have picked out a few cultural overtones from the symphony of life and have once more failed to hear the mighty and primordial melody of the instincts.

In order to preserve this system intact it was necessary to turn entirely away from observation and from the technique of psycho-analysis. Occasionally enthusiasm for the cause even permitted a disregard of scientific logic - as when Jung finds that the Oedipus complex is not 'specific' enough for the aetiology of the neuroses, and proceeds to attribute this specific quality to inertia, the most universal characteristic of all matter, animate and inanimate! It is to be noted, by the way, that the 'Oedipus complex' represents only a topic with which the individual's mental forces have to deal, and is not itself a force, like 'psychical inertia'. The study of individual people had shown (and always will show) that the sexual complexes in their original sense are alive in them. On that account the investigation of individuals was pushed into the background and replaced by conclusions based on evidence derived from anthropological research. The greatest risk of coming up against the original, undisguised meaning of these re-interpreted complexes was to be met with in the early childhood of every individual; consequently in therapy the injunction was laid down that this past history should be dwelt on as little as possible and the main emphasis put on reverting to the current conflict, in which, moreover, the essential thing was on no account to be what was accidental and personal, but what was general - in fact, the non-fulfilment of the life-task. As we know, however, a neurotic's current conflict becomes comprehensible and admits of solution only when it is traced back to his prehistory, when one goes back along the path that his libido took when he fell ill.

The form taken by the Neo-Zurich therapy under these influences can be conveyed in the words of a patient who experienced it himself: 'This time not a trace of attention was given to the past or to the transference. Wherever I thought I recognized the latter it was pronounced to be a pure libidinal symbol. The moral instruction was very fine and I followed it faithfully, but I did not advance a step. It was even more annoying for me than for him, but how could I help it? . . . Instead of freeing me by analysis, every day brought fresh tremendous demands on me, which had to be fulfilled if the neurosis was to be conquered - for instance, inward concentration by means of introversion, religious meditation, resuming life with my wife in loving devotion, etc. It was almost beyond one's strength; it was aiming at a radical transformation of one's whole inner nature. I left the analysis as a poor sinner with intense feelings of contrition and the best resolutions, but at the same time in utter discouragement. Any clergyman would have advised what he recommended, but where was I to find the strength?' The patient, it is true, reported that he had heard that analysis of the past and of the transference must be gone through first; but he had been told that he had already had enough of it. Since this first kind of analysis had not helped him more, the conclusion seems to me justified that the patient had *not* had enough of it. Certainly the subsequent treatment, which no longer had any claim to be called psycho-analysis, did not improve matters. It is remarkable that the members of the Zurich school should have made the long journey round by way of Vienna in order to wind up at the nearby city of Berne, where Dubois cures neuroses by ethical encouragement in a more considerate manner.¹

The total incompatibility of this new movement with psycho-analysis shows itself too, of course, in Jung's treatment of repression, which is hardly mentioned nowadays in his writings, in his misunderstanding of dreams, which, like Adler, in complete disregard of dream-psychology, he confuses with the latent dream-thoughts, and in his loss of all understanding of the unconscious - in short, in all the points which I should regard as the essence of psycho-analysis. When Jung tells us that the incest-complex is merely 'symbolic', that after all it has no 'real' existence, that after all a savage feels no desire towards an old hag but prefers a young and pretty woman, we are tempted to conclude that 'symbolic' and 'without real existence' simply mean something which, in virtue of its manifestations and pathogenic effects, is described by psycho-analysis as 'existing unconsciously' - a description that disposes of the apparent contradiction.

¹ I know the objections there are to making use of a patient's reports, and I will therefore expressly state that my informant is a trustworthy person, very well capable of forming a judgement. He gave me this information quite spontaneously and I make use of his communication without asking his consent, since I cannot allow that a psycho-analytic technique has any right to claim the protection of medical discretion.

If one bears in mind that dreams are something different from the latent dream-thoughts which they work over, there is nothing surprising in patients dreaming of things with which their minds have been filled during the treatment, whether it be the 'life-task', or 'being on top' or 'underneath'. The dreams of people being analysed can undoubtedly be directed, in the same way as they are by stimuli produced for experimental purposes. One can determine a part of the material which appears in a dream; nothing in the essence or mechanism of dreams is altered by this. Nor do I believe that 'biographical' dreams, as they are called, occur outside analysis. If, on the other hand, one analyses dreams which occurred before treatment, or if one considers the dreamer's own additions to what has been suggested to him in the treatment, or if one avoids setting him any such tasks, then one may convince oneself how far removed it is from the purpose of a dream to produce attempted solutions of the life-task. Dreams are only a form of thinking; one can never reach an understanding of this form by reference to the content of the thoughts; only an appreciation of the dream-work will lead to that understanding.

It is not difficult to find a factual refutation of Jung's misconceptions of psycho-analysis and deviations from it. Every analysis conducted in a proper manner, and in particular every analysis of a child, strengthens the convictions upon which the theory of psycho-analysis is founded, and rebuts the re-interpretations made by both Jung's and Adler's systems. In the days before his illumination, Jung himself carried out and published an analysis of this kind of a child; it remains to be seen whether he will undertake a new interpretation of its results with the help of a different 'one-sided arrangement of the facts', to use the expression employed by Adler in this connection.

The view that the sexual representation of 'higher' thoughts in dreams and neurosis is nothing but an archaic mode of expression is of course irreconcilable with the fact that in neurosis these sexual complexes prove to be the bearers of the quantities of libido which have been withdrawn from utilization in real life. If it was merely a question of a sexual 'jargon', the economy of the libido could not have been altered in any way by it. Jung admits this himself in his *Darstellung der psychoanalytischen Theorie* and formulates the task of therapy as the detaching of libidinal cathexes from these complexes. This can never be achieved, however, by directing the patient away from them and urging him to sublimate, but only by exhaustive examination of them and by making them fully and completely conscious. The first piece of reality which the patient must deal with is his illness. Efforts to spare him that task point to the physician's incapacity to help him to overcome his resistances, or else to the physician's dread of the results of the work.

It may be said lastly that by his 'modification' of psycho-analysis Jung has given us a counterpart to the famous Lichtenberg knife. He has changed the hilt, and he has put a new blade into it; yet because the same name is engraved on it we are expected to regard the instrument as the original one.

I think I have made clear, on the contrary, that the new teaching which aims at replacing psycho-analysis signifies an abandonment of analysis and a secession from it. Some people may be inclined to fear that this secession is bound to have more momentous consequences for analysis than would another, owing to its having been started by men who have played so great a part in the movement and have done so much to advance it. I do not share this apprehension.

Men are strong so long as they represent a strong idea; they become powerless when they oppose it. Psycho-analysis will survive this loss and gain new adherents in place of these. In conclusion, I can only express a wish that fortune may grant an agreeable upward journey to all those who have found their stay in the underworld of psycho-analysis too uncomfortable for their taste. The rest of us, I hope, will be permitted without hindrance to carry through to their conclusion our labours in the depths.

February, 1914.

ON NARCISSISM: AN INTRODUCTION
(1914)

Intentionally left blank

ON NARCISSISM: AN INTRODUCTION

I

The term narcissism is derived from clinical description and was chosen by Paul Näcke in 1899 to denote the attitude of a person who treats his own body in the same way in which the body of a sexual object is ordinarily treated - who looks at it, that is to say, strokes it and fondles it till he obtains complete satisfaction through these activities. Developed to this degree, narcissism has the significance of a perversion that has absorbed the whole of the subject's sexual life, and it will consequently exhibit the characteristics which we expect to meet with in the study of all perversions.

Psycho-analytic observers were subsequently struck by the fact that individual features of the narcissistic attitude are found in many people who suffer from other disorders - for instance, as Sadger has pointed out, in homosexuals - and finally it seemed probable that an allocation of the libido such as deserved to be described as narcissism might be present far more extensively, and that it might claim a place in the regular course of human sexual development.¹ Difficulties in psycho-analytic work upon neurotics led to the same supposition, for it seemed as though this kind of narcissistic attitude in them constituted one of the limits to their susceptibility to influence. Narcissism in this sense would not be a perversion, but the libidinal complement to the egoism of the instinct of self-preservation, a measure of which may justifiably be attributed to every living creature.

¹ Otto Rank (1911c).

A pressing motive for occupying ourselves with the conception of a primary and normal narcissism arose when the attempt was made to subsume what we know of dementia praecox (Kraepelin) or schizophrenia (Bleuler) under the hypothesis of the libido theory. Patients of this kind, whom I have proposed to term paraphrenics, display two fundamental characteristics: megalomania and diversion of their interest from the external world - from people and things. In consequence of the latter change, they become inaccessible to the influence of psycho-analysis and cannot be cured by our efforts. But the paraphrenic's turning away from the external world needs to be more precisely characterized. A patient suffering from hysteria or obsessional neurosis has also, as far as his illness extends, given up his relation to reality. But analysis shows that he has by no means broken off his erotic relations to people and things. He still retains them in phantasy; i.e. he has, on the one hand, substituted for real objects imaginary ones from his memory, or has mixed the latter with the former; and on the other hand, he has renounced the initiation of motor activities for the attainment of his aims in connection with those objects. Only to this condition of the libido may we legitimately apply the term 'introversion' of the libido which is used by Jung indiscriminately. It is otherwise with the paraphrenic. He seems really to have withdrawn his libido from people and things in the external world, without replacing them by others in phantasy. When he *does* so replace them, the process seems to be a secondary one and to be part of an attempt at recovery, designed to lead the libido back to objects.¹

The question arises: What happens to the libido which has been withdrawn from external objects in schizophrenia? The megalomania characteristic of these states points the way. This megalomania has no doubt come into being at the expense of object-libido. The libido that has been withdrawn from the external world has been directed to the ego and thus gives rise to an attitude which may be called narcissism. But the megalomania itself is no new creation; on the contrary, it is, as we know, a magnification and plainer manifestation of a condition which had already existed previously. This leads us to look upon the narcissism which arises through the drawing in of object-cathexes as a secondary one, superimposed upon a primary narcissism that is obscured by a number of different influences.

¹ In connection with this see my discussion of the 'end of the world' in the analysis of Senatspräsident Schreber; also Abraham, 1908.

Let me insist that I am not proposing here to explain or penetrate further into the problem of schizophrenia, but that I am merely putting together what has already been said elsewhere, in order to justify the introduction of the concept of narcissism.

This extension of the libido theory - in my opinion, a legitimate one - receives reinforcement from a third quarter, namely, from our observations and views on the mental life of children and primitive peoples. In the latter we find characteristics which, if they occurred singly, might be put down to megalomania: an over-estimation of the power of their wishes and mental acts, the 'omnipotence of thoughts', a belief in the thaumaturgic force of words, and a technique for dealing with the external world - 'magic' - which appears to be a logical application of these grandiose premisses.¹ In the children of to-day, whose development is much more obscure to us, we expect to find an exactly analogous attitude towards the external world.² Thus we form the idea of there being an original libidinal cathexis of the ego, from which some is later given off to objects, but which fundamentally persists and is related to the object-cathexes much as the body of an amoeba is related to the pseudopodia which it puts out. In our researches, taking, as they did, neurotic symptoms for their starting-point, this part of the allocation of libido necessarily remained hidden from us at the outset. All that we noticed were the emanations of this libido - the object-cathexes, which can be sent out and drawn back again. We see also, broadly speaking, an antithesis between ego-libido and object-libido. The more of the one is employed, the more the other becomes depleted. The highest phase of development of which object-libido is capable is seen in the state of being in love, when the subject seems to give up his own personality in favour of an object-cathexis; while we have the opposite condition in the paranoid's phantasy (or self-perception) of the 'end of the world'.³ Finally, as regards the differentiation of psychical energies, we are led to the conclusion that to begin with, during the state of narcissism, they exist together and that our analysis is too coarse to distinguish between them; not until there is object-cathexis is it possible to discriminate a sexual energy - the libido - from an energy of the ego-instincts.

¹ Cf. the passages in my *Totem and Taboo* (1912-13) which deal with this subject.

² Cf. Ferenczi (1913a).

³ There are two mechanisms of this 'end of the world' idea: in the one case, the whole libidinal cathexis flows off to the loved object; in the other, it all flows back into the ego.

Before going any further I must touch on two questions which lead us to the heart of the difficulties of our subject. In the first place, what is the relation of the narcissism of which we are now speaking to auto-erotism, which we have described as an early state of the libido? Secondly, if we grant the ego a primary cathexis of libido, why is there any necessity for further distinguishing a sexual libido from a non-sexual energy of the ego-instincts? Would not the postulation of a single kind of psychical energy save us all the difficulties of differentiating an energy of the ego-instincts from ego-libido, and ego-libido from object-libido?

As regards the first question, I may point out that we are bound to suppose that a unity comparable to the ego cannot exist in the individual from the start; the ego has to be developed. The auto-erotic instincts, however, are there from the very first; so there must be something added to auto-erotism - a new psychical action - in order to bring about narcissism.

To be asked to give a definite answer to the second question must occasion perceptible uneasiness in every psycho-analyst. One dislikes the thought of abandoning observation for barren theoretical controversy, but nevertheless one must not shirk an attempt at clarification. It is true that notions such as that of an ego-libido, an energy of the ego-instincts, and so on, are neither particularly easy to grasp, nor sufficiently rich in content; a speculative theory of the relations in question would begin by seeking to obtain a sharply defined concept as its basis. But I am of opinion that that is just the difference between a speculative theory and a science erected on empirical interpretation. The latter will not envy speculation its privilege of having a smooth, logically unassailable foundation, but will gladly content itself with nebulous, scarcely imaginable basic concepts, which it hopes to apprehend more clearly in the course of its development, or which it is even prepared to replace by others. For these ideas are not the foundation of science, upon which everything rests: that foundation is observation alone. They are not the bottom but the top of the whole structure, and they can be replaced and discarded without damaging it. The same thing is happening in our day in the science of physics, the basic notions of which as regards matter, centres of force, attraction, etc., are scarcely less debatable than the corresponding notions in psycho-analysis.

The value of the concepts 'ego-libido' and 'object-libido' lies in the fact that they are derived from the study of the intimate characteristics of neurotic and psychotic processes. A differentiation of libido into a kind which is proper to the ego and one which is attached to objects is an unavoidable corollary to an original hypothesis which distinguished between sexual instincts and ego-instincts. At any rate, analysis of the pure transference neuroses (hysteria and obsessional neurosis) compelled me to make this distinction and I only know that all attempts to account for these phenomena by other means have been completely unsuccessful.

In the total absence of any theory of the instincts which would help us to find our bearings, we may be permitted, or rather, it is incumbent upon us, to start off by working out some hypothesis to its logical conclusion, until it either breaks down or is confirmed. There are various points in favour of the hypothesis of there having been from the first a separation between sexual instincts and others, ego-instincts, besides the serviceability of such a hypothesis in the analysis of the transference neuroses. I admit that this latter consideration alone would not be unambiguous, for it might be a question of an indifferent psychical energy which only becomes libido through the act of cathecting an object. But, in the first place, the distinction made in this concept corresponds to the common, popular distinction between hunger and love. In the second place, there are biological considerations in its favour. The individual does actually carry on a twofold existence: one to serve his own purposes and the other as a link in a chain, which he serves against his will, or at least involuntarily. The individual himself regards sexuality as one of his own ends; whereas from another point of view he is an appendage to his germ plasm, at whose disposal he puts his energies in return for a bonus of pleasure. He is the mortal vehicle of a (possibly) immortal substance - like the inheritor of an entailed property, who is only the temporary holder of an estate which survives him. The separation of the sexual instincts from the ego-instincts would simply reflect this twofold function of the individual. Thirdly, we must recollect that all our provisional ideas in psychology will presumably some day be based on an organic substructure. This makes it probable that it is special substances and chemical processes which perform the operations of sexuality and provide for the extension of individual life into that of the species. We are taking this probability into account in replacing the special chemical substances by special psychical forces.

I try in general to keep psychology clear from everything that is different in nature from it, even biological lines of thought. For that very reason I should like at this point expressly to admit that the hypothesis of separate ego-instincts and sexual instincts (that is to say, the libido theory) rests scarcely at all upon a psychological basis, but derives its principal support from biology. But I shall be consistent enough to drop this hypothesis if psycho-analytic work should itself produce some other, more serviceable hypothesis about the instincts. So far, this has not happened. It may turn out that, most basically and on the longest view, sexual energy - libido - is only the product of a differentiation in the energy at work generally in the mind. But such an assertion has no relevance. It relates to matters which are so remote from the problems of our observation, and of which we have so little cognizance, that it is as idle to dispute it as to affirm it; this primal identity may well have as little to do with our analytic interests as the primal kinship of all the races of mankind has to do with the proof of kinship required in order to establish a legal right of inheritance. All these speculations take us nowhere. Since we cannot wait for another science to present us with the final conclusions on the theory of the instincts, it is far more to the purpose that we should try to see what light may be thrown upon this basic problem of biology by a synthesis of the *psychological* phenomena. Let us face the possibility of error; but do not let us be deterred from pursuing the logical implications of the hypothesis we first adopted of an antithesis between ego-instincts and sexual instincts (a hypothesis to which we were forcibly led by analysis of the transference neuroses), and from seeing whether it turns out to be without contradictions and fruitful, and whether it can be applied to other disorders as well, such as schizophrenia.

It would, of course, be a different matter if it were proved that the libido theory has already come to grief in the attempt to explain the latter disease. This has been asserted by C. G. Jung (1912) and it is on that account that I have been obliged to enter upon this last discussion, which I would gladly have been spared. I should have preferred to follow to its end the course embarked upon in the analysis of the Schreber case without any discussion of its premisses. But Jung's assertion is, to say the least of it, premature. The grounds he gives for it are scanty. In the first place, he appeals to an admission of my own that I myself have been obliged, owing to the difficulties of the Schreber analysis, to extend the concept of libido (that is, to give up its sexual content) and to identify libido with psychical interest in general. Ferenczi (1913*b*), in an exhaustive criticism of Jung's work, has already said all that is necessary in correction of this erroneous interpretation. I can only corroborate his criticism and repeat that I have never made any such retraction of the libido theory. Another argument of Jung's, namely, that we cannot suppose that the withdrawal of the libido is in itself enough to bring about the loss of the normal function of reality, is no argument but a dictum. It 'begs the question',¹ and saves discussion; for whether and how this is possible was precisely the point that should have been under investigation. In his next major work, Jung (1913) just misses the solution I had long since indicated: 'At the same time', he writes, 'there is this to be further taken into consideration (a point to which, incidentally, Freud refers in his work on the Schreber case) - that the introversion of the *libido sexualis* leads to a cathexis of the "ego", and that it may possibly be this that produces the result of a loss of reality. It is indeed a tempting possibility to explain the psychology of the loss of reality in this fashion.' But Jung does not enter much further into a discussion of this possibility. A few lines later he dismisses it with the remark that this determinant 'would result in the psychology of an ascetic anchorite, not in a dementia praecox'. How little this inapt analogy can help us to decide the question may be learnt from the consideration that an anchorite of this kind, who 'tries to eradicate every trace of sexual interest' (but only in the popular sense of the word 'sexual'), does not even necessarily display any pathogenic allocation of the libido. He may have diverted his sexual interest from human beings entirely, and yet may have sublimated it into a heightened interest in the divine, in nature, or in the animal kingdom, without his libido having undergone an introversion on to his phantasies or a return to his ego. This analogy would seem to rule out in advance the possibility of differentiating between interest emanating from erotic sources and from others. Let us remember, further, that the researches of the Swiss school, however valuable, have elucidated only two features in the picture of dementia praecox - the presence in it of complexes known to us both in healthy and neurotic subjects, and the similarity of the phantasies that occur in it to popular myths - but that they have not been able to throw any further light on the mechanism of the disease. We may repudiate Jung's assertion, then, that the libido theory has come to grief in the attempt to explain dementia praecox, and that it is therefore disposed of for the other neuroses as well.

¹ [In English in the original.]

II

Certain special difficulties seem to me to lie in the way of a direct study of narcissism. Our chief means of access to it will probably remain the analysis of the paraphrenias. Just as the transference neuroses have enabled us to trace the libidinal instinctual impulses, so dementia praecox and paranoia will give us an insight into the psychology of the ego. Once more, in order to arrive at an understanding of what seems so simple in normal phenomena, we shall have to turn to the field of pathology with its distortions and exaggerations. At the same time, other means of approach remain open to us, by which we may obtain a better knowledge of narcissism. These I shall now discuss in the following order: the study of organic disease, of hypochondria and of the erotic life of the sexes.

In estimating the influence of organic disease upon the distribution of libido, I follow a suggestion made to me orally by Sándor Ferenczi. It is universally known, and we take it as a matter of course, that a person who is tormented by organic pain and discomfort gives up his interest in the things of the external world, in so far as they do not concern his suffering. Closer observation teaches us that he also withdraws *libidinal* interest from his love-objects: so long as he suffers, he ceases to love. The commonplace nature of this fact is no reason why we should be deterred from translating it into terms of the libido theory. We should then say: (the sick man withdraws his libidinal cathexes back upon his own ego, and sends them out again when he recovers. 'Concentrated is his soul', says Wilhelm Busch of the poet suffering from toothache, 'in his molar's narrow hole.' Here libido and ego-interest share the same fate and are once more indistinguishable from each other. The familiar egoism of the sick person covers both. We find it so natural because we are certain that in the same situation we should behave in just the same way. The way in which a lover's feelings, however strong, are banished by bodily ailments, and suddenly replaced by complete indifference, is a theme which has been exploited by comic writers to an appropriate extent.

The condition of sleep, too, resembles illness in implying a narcissistic withdrawal of the positions of the libido on to the subject's own self, or, more precisely, on to the single wish to sleep. The egoism of dreams fits very well into this context. In both states we have, if nothing else, examples of changes in the distribution of libido that are consequent upon an alteration of the ego.

Hypochondria, like organic disease, manifests itself in distressing and painful bodily sensations, and it has the same effect as organic disease on the distribution of libido. The hypochondriac withdraws both interest and libido - the latter specially markedly - from the objects of the external world and concentrates both of them upon the organ that is engaging his attention. A difference between hypochondria and organic disease now becomes evident: in the latter, the distressing sensations are based upon demonstrable changes; in the former, this is not so. But it would be entirely in keeping with our general conception of the processes of neurosis if we decided to say that hypochondria must be right: organic changes must be supposed to be present in it, too.

But what could these changes be? We will let ourselves be guided at this point by our experience, which shows that bodily sensations of an unpleasurable nature, comparable to those of hypochondria, occur in the other neuroses as well. I have said before that I am inclined to class hypochondria with neurasthenia and anxiety-neurosis as a third 'actual' neurosis. It would probably not be going too far to suppose that in the case of the other neuroses a small amount of hypochondria was regularly formed at the same time as well. We have the best example of this, I think, in anxiety neurosis with its superstructure of hysteria. Now the familiar prototype of an organ that is painfully tender, that is in some way changed and that is yet not diseased in the ordinary sense, is the genital organ in its states of excitation. In that condition it becomes congested with blood, swollen and humected, and is the seat of a multiplicity of sensations. Let us now, taking any part of the body, describe its activity of sending sexually exciting stimuli to the mind as its 'erotogenicity', and let us further reflect that the considerations on which our theory of sexuality was based have long accustomed us to the notion that certain other parts of the body - the 'erotogenic' zones - may act as substitutes for the genitals and behave analogously to them. We have then only one more step to take. We can decide to regard erotogenicity as a general characteristic of all organs and may then speak of an increase or decrease of it in a particular part of the body. For every such change in the erotogenicity of the organs there might then be a parallel change of libidinal cathexis in the ego. Such factors would constitute what we believe to underlie hypochondria and what may have the same effect upon the distribution of libido as is produced by a material illness of the organs.

We see that, if we follow up this line of thought, we come up against the problem not only of hypochondria, but of the other 'actual' neuroses - neurasthenia and anxiety neurosis. Let us therefore stop at this point. It is not within the scope of a purely psychological inquiry to penetrate so far behind the frontiers of physiological research. I will merely mention that from this point of view we may suspect that the relation of hypochondria to paraphrenia is similar to that of the other 'actual' neuroses to hysteria and obsessional neurosis: we may suspect, that is, that it is dependent on ego-libido just as the others are on object-libido, and that hypochondriacal anxiety is the counterpart, as coming from ego-libido, to neurotic anxiety. Further, since we are already familiar with the idea that the mechanism of falling ill and of the formation of symptoms in the transference neuroses - the path from introversion to regression - is to be linked to a damming-up of object-libido,¹ we may come to closer quarters with the idea of a damming-up of ego-libido as well and may bring this idea into relation with the phenomena of hypochondria and paraphrenia.

At this point, our curiosity will of course raise the question why this damming-up of libido in the ego should have to be experienced as unpleasurable. I shall content myself with the answer that unpleasure is always the expression of a higher degree of tension, and that therefore what is happening is that a quantity in the field of material events is being transformed here as elsewhere into the psychical quality of unpleasure. Nevertheless it may be that what is decisive for the generation of unpleasure is not the absolute magnitude of the material event, but rather some particular function of that absolute magnitude. Here we may even venture to touch on the question of what makes it necessary at all for our mental life to pass beyond the limits of narcissism and to attach the libido to objects. The answer which would follow from our line of thought would once more be that this necessity arises when the cathexis of the ego with libido exceeds a certain amount. A strong egoism is a protection against falling ill, but in the last resort we must begin to love in order not to fall ill, and we are bound to fall ill if, in consequence of frustration, we are unable to love. This follows somewhat on the lines of Heine's picture of the psychogenesis of the Creation:

Krankheit ist wohl der letzte Grund
Des ganzen Schöpferdrangs gewesen;
Erschaffend konnte ich genesen,
Erschaffend wurde ich gesund.²

We have recognized our mental apparatus as being first and foremost a device designed for mastering excitations which would otherwise be felt as distressing or would have pathogenic effects. Working them over in the mind helps remarkably towards an internal draining away of excitations which are incapable of direct discharge outwards, or for which such a discharge is for the moment undesirable. In the first instance, however, it is a matter of indifference whether this internal process of working-over is carried out upon real or imaginary objects. The difference does not appear till later - if the turning of the libido on to unreal objects (introversion) has led to its being dammed up. In paraphrenics, megalomania allows of a similar internal working-over of libido which has returned to the ego; perhaps it is only when the megalomania fails that the damming-up of libido in the ego becomes pathogenic and starts the process of recovery which gives us the impression of being a disease.

¹ Cf. 'Types of Onset of Neurosis' (1912c).

² ['Illness was no doubt the final cause of the whole urge to create. By creating, I could recover; by creating, I became healthy.']

I shall try here to penetrate a little further into the mechanism of paraphrenia and shall bring together those views which already seem to me to deserve consideration. The difference between paraphrenic affections and the transference neuroses appears to me to lie in the circumstance that, in the former, the libido that is liberated by frustration does not remain attached to objects in phantasy, but withdraws on to the ego. Megalomania would accordingly correspond to the psychical mastering of this latter amount of libido, and would thus be the counterpart of the introversion on to phantasies that is found in the transference neuroses; a failure of this psychical function gives rise to the hypochondria of paraphrenia and this is homologous to the anxiety of the transference neuroses. We know that this anxiety can be resolved by further psychical working over, i.e. by conversion, reaction-formation or the construction of protections (phobias). The corresponding process in paraphrenics is an attempt at restoration, to which the striking manifestations of the disease are due. Since paraphrenia frequently, if not usually, brings about only a *partial* detachment of the libido from objects, we can distinguish three groups of phenomena in the clinical picture: (1) those representing what remains of a normal state or of neurosis (residual phenomena); (2) those representing the morbid process (detachment of libido from its objects and, further, megalomania, hypochondria, affective disturbance and every kind of regression); (3) those representing restoration, in which the libido is once more attached to objects, after the manner of a hysteria (in dementia praecox or paraphrenia proper), or of an obsessional neurosis (in paranoia). This fresh libidinal cathexis differs from the primary one in that it starts from another level and under other conditions. The difference between the transference neuroses brought about in the case of this fresh kind of libidinal cathexis and the corresponding formations where the ego is normal should be able to afford us the deepest insight into the structure of our mental apparatus.

A third way in which we may approach the study of narcissism is by observing the erotic life of human beings, with its many kinds of differentiation in man and woman. Just as object-libido at first concealed ego-libido from our observation, so too in connection with the object-choice of infants (and of growing children) what we first noticed was that they derived their sexual objects from their experiences of satisfaction. The first auto-erotic sexual satisfactions are experienced in connection with vital functions which serve the purpose of self-preservation. The sexual instincts are at the outset attached to the satisfaction of the ego-instincts; only later do they become independent of these, and even then we have an indication of that original attachment in the fact that the persons who are concerned with a child's feeding, care, and protection become his earliest sexual objects: that is to say, in the first instance his mother or a substitute for her. Side by side, however, with this type and source of object-choice, which may be called the 'anaclitic' or 'attachment' type, psycho-analytic research has revealed a second type, which we were not prepared for finding. We have discovered, especially clearly in people whose libidinal development has suffered some disturbance, such as perverts and homosexuals, that in their later choice of love-objects they have taken as a model not their mother but their own selves. They are plainly seeking *themselves* as a love-object, and are exhibiting a type of object-choice which must be termed 'narcissistic'. In this observation we have the strongest of the reasons which have led us to adopt the hypothesis of narcissism.

We have, however, not concluded that human beings are divided into two sharply differentiated groups, according as their object-choice conforms to the anaclitic or to the narcissistic type; we assume rather that both kinds of object-choice are open to each individual, though he may show a preference for one or the other. We say that a human being has originally two sexual objects - himself and the woman who nurses him - and in doing so we are postulating a primary narcissism in everyone, which may in some cases manifest itself in a dominating fashion in his object-choice.

A comparison of the male and female sexes then shows that there are fundamental differences between them in respect of their type of object-choice, although these differences are of course not universal. Complete object-love of the attachment type is, properly speaking, characteristic of the male. It displays the marked sexual overvaluation which is doubtless derived from the child's original narcissism and thus corresponds to a transference of that narcissism to the sexual object. This sexual overvaluation is the origin of the peculiar state of being in love, a state suggestive of a neurotic compulsion, which is thus traceable to an impoverishment of the ego as regards libido in favour of the love-object. A different course is followed in the type of female most frequently met with, which is probably the purest and truest one. With the onset of puberty the maturing of the female sexual organs, which up till then have been in a condition of latency, seems to bring about an intensification of the original narcissism, and this is unfavourable to the development of a true object-choice with its accompanying sexual overvaluation. Women, especially if they grow up with good looks, develop a certain self-contentment which compensates them for the social restrictions that are imposed upon them in their choice of object. Strictly speaking, it is only themselves that such women love with an intensity comparable to that of the man's love for them. Nor does their need lie in the direction of loving, but of being loved; and the man who fulfils this condition is the one who finds favour with them. The importance of this type of woman for the erotic life of mankind is to be rated very high. Such women have the greatest fascination for men, not only for aesthetic reasons, since as a rule they are the most beautiful, but also because of a combination of interesting psychological factors. For it seems very evident that another person's narcissism has a great attraction for those who have renounced part of their own narcissism and are in search of object-love. The charm of a child lies to a great extent in his narcissism, his self-contentment and inaccessibility, just as does the charm of certain animals which seem not to concern themselves about us, such as cats and the large beasts of prey. Indeed, even great criminals and humorists, as they are represented in literature, compel our interest by the narcissistic consistency with which they manage to keep away from their ego anything that would diminish it. It is as if we envied them for maintaining a blissful state of mind - an unassailable libidinal position which we ourselves have since abandoned. The great charm of narcissistic women has, however, its reverse side; a large part of the lover's dissatisfaction, of his doubts of the woman's love, of his complaints of her enigmatic nature, has its root in this incongruity between the types of object-choice.

Perhaps it is not out of place here to give an assurance that this description of the feminine form of erotic life is not due to my tendentious desire on my part to depreciate women. Apart from the fact that tendentiousness is quite alien to me, I know that these different lines of development correspond to the differentiation of functions in a highly complicated biological whole; further, I am ready to admit that there are quite a number of women who love according to the masculine type and who also develop the sexual overvaluation proper to that type.

Even for narcissistic women, whose attitude towards men remains cool, there is a road which leads to complete object-love. In the child which they bear, a part of their own body confronts them like an extraneous object, to which, starting out from their narcissism, they can then give complete object-love. There are other women, again, who do not have to wait for a child in order to take the step in development from (secondary) narcissism to object-love. Before puberty they feel masculine and develop some way along masculine lines; after this trend has been cut short on their reaching female maturity, they still retain the capacity of longing for a masculine ideal - an ideal which is in fact a survival of the boyish nature that they themselves once possessed.

What I have so far said by way of indication may be concluded by a short summary of the paths leading to the choice of an object.

A person may love:-

(1) According to the narcissistic type:

- (a) what he himself is (i.e. himself),
- (b) what he himself was,
- (c) what he himself would like to be,
- (d) someone who was once part of himself.

(2) According to the anaclitic (attachment) type:

- (a) the woman who feeds him,
- (b) the man who protects him,

and the succession of substitutes who take their place. The inclusion of case (c) of the first type cannot be justified till a later stage of this discussion.

The significance of narcissistic object-choice for homosexuality in men must be considered in another connection.

The primary narcissism of children which we have assumed and which forms one of the postulates of our theories of the libido, is less easy to grasp by direct observation than to confirm by inference from elsewhere. If we look at the attitude of affectionate parents towards their children, we have to recognize that it is a revival and reproduction of their own narcissism, which they have long since abandoned. The trustworthy pointer constituted by overvaluation, which we have already recognized as a narcissistic stigma in the case of object-choice, dominates, as we all know, their emotional attitude. Thus they are under a compulsion to ascribe every perfection to the child - which sober observation would find no occasion to do - and to conceal and forget all his shortcomings. (Incidentally, the denial of sexuality in children is connected with this.) Moreover, they are inclined to suspend in the child's favour the operation of all the cultural acquisitions which their own narcissism has been forced to respect, and to renew on his behalf the claims to privileges which were long ago given up by themselves. The child shall have a better time than his parents; he shall not be subject to the necessities which they have recognized as paramount in life. Illness, death, renunciation of enjoyment, restrictions on his own will, shall not touch him; the laws of nature and of society shall be abrogated in his favour; he shall once more really be the centre and core of creation - 'His Majesty the Baby',¹ as we once fancied ourselves. The child shall fulfil those wishful dreams of the parents which they never carried out - the boy shall become a great man and a hero in his father's place, and the girl shall marry a prince as a tardy compensation for her mother. At the most touchy point in the narcissistic system, the immortality of the ego, which is so hard pressed by reality, security is achieved by taking refuge in the child. Parental love, which is so moving and at bottom so childish, is nothing but the parents' narcissism born again, which, transformed into object-love, unmistakably reveals its former nature.

¹ [In English in the original.]

III

The disturbances to which a child's original narcissism is exposed, the reactions with which he seeks to protect himself from them and the paths into which he is forced in doing so - these are themes which I propose to leave on one side, as an important field of work which still awaits exploration. The most significant portion of it, however, can be singled out in the shape of the 'castration complex' (in boys, anxiety about the penis - in girls, envy for the penis) and treated in connection with the effect of early deterrence from sexual activity. Psycho-analytic research ordinarily enables us to trace the vicissitudes undergone by the libidinal instincts when these, isolated from the ego-instincts, are placed in opposition to them; but in the particular field of the castration complex, it allows us to infer the existence of an epoch and a psychical situation in which the two groups of instincts, still operating in unison and inseparably mingled, make their appearance as narcissistic interests. It is from this context that Adler has derived his concept of the 'masculine protest', which he has elevated almost to the position of the sole motive force in the formation of character and neurosis alike and which he bases not on a narcissistic, and therefore still a libidinal, trend, but on a social valuation. Psycho-analytic research has from the very beginning recognized the existence and importance of the 'masculine protest', but it has regarded it, in opposition to Adler, as narcissistic in nature and derived from the castration complex. The 'masculine protest' is concerned in the formation of character, into the genesis of which it enters along with many other factors, but it is completely unsuited for explaining the problems of the neuroses, with regard to which Adler takes account of nothing but the manner in which they serve the ego-instincts. I find it quite impossible to place the genesis of neurosis upon the narrow basis of the castration complex, however powerfully it may come to the fore in men among their resistances to the cure of a neurosis. Incidentally, I know of cases of neurosis in which the 'masculine protest', or, as we regard it, the castration complex, plays no pathogenic part, and even fails to appear at all.

Observation of normal adults shows that their former megalomania has been damped down and that the psychical characteristics from which we inferred their infantile narcissism have been effaced. What has become of their ego-libido? Are we to suppose that the whole amount of it has passed into object-cathexes? Such a possibility is plainly contrary to the whole trend of our argument; but we may find a hint at another answer to the question in the psychology of repression.

We have learnt that libidinal instinctual impulses undergo the vicissitude of pathogenic repression if they come into conflict with the subject's cultural and ethical ideas. By this we never mean that the individual in question has a merely intellectual knowledge of the existence of such ideas; we always mean that he recognizes them as a standard for himself and submits to the claims they make on him. Repression, we have said, proceeds from the ego; we might say with greater precision that it proceeds from the self-respect of the ego. The same impressions, experiences, impulses and desires that one man indulges or at least works over consciously will be rejected with the utmost indignation by another, or even stifled before they enter consciousness. The difference between the two, which contains the conditioning factor of repression, can easily be expressed in terms which enable it to be explained by the libido theory. We can say that the one man has set up an *ideal* in himself by which he measures his actual ego, while the other has formed no such ideal. For the ego the formation of an ideal would be the conditioning factor of repression.

This ideal ego is now the target of the self-love which was enjoyed in childhood by the actual ego. The subject's narcissism makes its appearance displaced on to this new ideal ego, which, like the infantile ego, finds itself possessed of every perfection that is of value. As always where the libido is concerned, man has here again shown himself incapable of giving up a satisfaction he had once enjoyed. He is not willing to forgo the narcissistic perfection of his childhood; and when, as he grows up, he is disturbed by the admonitions of others and by the awakening of his own critical judgement, so that he can no longer retain that perfection, he seeks to recover it in the new form of an ego ideal. What he projects before him as his ideal is the substitute for the lost narcissism of his childhood in which he was his own ideal.

We are naturally led to examine the relation between this forming of an ideal and sublimation. Sublimation is a process that concerns object-libido and consists in the instinct's directing itself towards an aim other than, and remote from, that of sexual satisfaction; in this process the accent falls upon deflection from sexuality. Idealization is a process that concerns the *object*; by it that object, without any alteration in its nature, is aggrandized and exalted in the subject's mind. Idealization is possible in the sphere of ego-libido as well as in that of object-libido. For example, the sexual overvaluation of an object is an idealization of it. In so far as sublimation describes something that has to do with the instinct and idealization something to do with the object, the two concepts are to be distinguished from each other.

The formation of an ego ideal is often confused with the sublimation of instinct, to the detriment of our understanding of the facts. A man who has exchanged his narcissism for homage to a high ego ideal has not necessarily on that account succeeded in sublimating his libidinal instincts. It is true that the ego ideal demands such sublimation, but it cannot enforce it; sublimation remains a special process which may be prompted by the ideal but the execution of which is entirely independent of any such prompting. It is precisely in neurotics that we find the highest differences of potential between the development of their ego ideal and the amount of sublimation of their primitive libidinal instincts; and in general it is far harder to convince an idealist of the inexpedient location of his libido than a plain man whose pretensions have remained more moderate. Further, the formation of an ego ideal and sublimation are quite differently related to the causation of neurosis. As we have learnt, the formation of an ideal heightens the demands of the ego and is the most powerful factor favouring repression; sublimation is a way out, a way by which those demands can be met *without* involving repression.

It would not surprise us if we were to find a special psychical agency which performs the task of seeing that narcissistic satisfaction from the ego ideal is ensured and which, with this end in view, constantly watches the actual ego and measures it by that ideal. If such an agency does exist, we cannot possibly come upon it as a *discovery* - we can only *recognize* it; for we may reflect that what we call our 'conscience' has the required characteristics. Recognition of this agency enables us to understand the so-called 'delusions of being noticed' or more correctly, of being *watched*, which are such striking symptoms in the paranoid diseases and which may also occur as an isolated form of illness, or intercalated in a transference neurosis. Patients of this sort complain that all their thoughts are known and their actions watched and supervised; they are informed of the functioning of this agency by voices which characteristically speak to them in the third person ('Now she's thinking of that again', 'now he's going out'). This complaint is justified; it describes the truth. A power of this kind, watching, discovering and criticizing all our intentions, does really exist. Indeed, it exists in every one of us in normal life.

Delusions of being watched present this power in a regressive form, thus revealing its genesis and the reason why the patient is in revolt against it. For what prompted the subject to form an ego ideal, on whose behalf his conscience acts as watchman, arose from the critical influence of his parents (conveyed to him by the medium of the voice), to whom were added, as time went on, those who trained and taught him and the innumerable and indefinable host of all the other people in his environment - his fellow-men - and public opinion.

In this way large amounts of libido of an essentially homosexual kind are drawn into the formation of the narcissistic ego ideal and find outlet and satisfaction in maintaining it. The institution of conscience was at bottom an embodiment, first of parental criticism, and subsequently of that of society - a process which is repeated in what takes place when a tendency towards repression develops out of a prohibition or obstacle that came in the first instance from without. The voices, as well as the undefined multitude, are brought into the foreground again by the disease, and so the evolution of conscience is reproduced regressively. But the revolt against this 'censoring agency' arises out of the subject's desire (in accordance with the fundamental character of his illness) to liberate himself from all these influences, beginning with the parental one, and out of his withdrawal of homosexual libido from them. His conscience then confronts him in a regressive form as a hostile influence from without.

The complaints made by paranoics also show that at bottom the self-criticism of conscience coincides with the self-observation on which it is based. Thus the activity of the mind which has taken over the function of conscience has also placed itself at the service of internal research, which furnishes philosophy with the material for its intellectual operations. This may have some bearing on the characteristic tendency of paranoics to construct speculative systems.¹

¹ I should like to add to this, merely by way of suggestion, that the developing and strengthening of this observing agency might contain within it the subsequent genesis of (subjective) memory and the time-factor, the latter of which has no application to unconscious processes.

It will certainly be of importance to us if evidence of the activity of this critically observing agency - which becomes heightened into conscience and philosophic introspection - can be found in other fields as well. I will mention here what Herbert Silberer has called the 'functional phenomenon', one of the few indisputably valuable additions to the theory of dreams. Silberer, as we know, has shown that in states between sleeping and waking we can directly observe the translation of thoughts into visual images, but that in these circumstances we frequently have a representation, not of a thought-content, but of the actual state (willingness, fatigue, etc.) of the person who is struggling against sleep. Similarly, he has shown that the conclusions of some dreams or some divisions in their content merely signify the dreamer's own perception of his sleeping and waking. Silberer has thus demonstrated the part played by observation - in the sense of the paranoid's delusions of being watched - in the formation of dreams. This part is not a constant one. Probably the reason why I overlooked it is because it does not play any great part in my own dreams; in persons who are gifted philosophically and accustomed to introspection it may become very evident.

We may here recall that we have found that the formation of dreams takes place under the dominance of a censorship which compels distortion of the dream-thoughts. We did not, however, picture this censorship as a special power, but chose the term to designate one side of the repressive trends that govern the ego, namely the side which is turned towards the dream-thoughts. If we enter further into the structure of the ego, we may recognize in the ego ideal and in the dynamic utterances of conscience the *dream-censor* as well. If this censor is to some extent on the alert even during sleep, we can understand how it is that its suggested activity of self-observation and self-criticism - with such thoughts as, 'now he is too sleepy to think', 'now he is waking up' - makes a contribution to the content of the dream.¹

¹ I cannot here determine whether the differentiation of the censoring agency from the rest of the ego is capable of forming the basis of the philosophic distinction between consciousness and self-consciousness.

At this point we may attempt some discussion of the self-regarding attitude in normal people and in neurotics.

In the first place self-regard appears to us to be an expression of the size of the ego; what the various elements are which go to determine that size is irrelevant. Everything a person possesses or achieves, every remnant of the primitive feeling of omnipotence which his experience has confirmed, helps to increase his self-regard.

Applying our distinction between sexual and ego-instincts, we must recognize that self-regard has a specially intimate dependence on narcissistic libido. Here we are supported by two fundamental facts: that in paraphrenics self-regard is increased, while in the transference neuroses it is diminished; and that in love-relations not being loved lowers the self-regarding feelings, while being loved raises them. As we have indicated, the aim and the satisfaction in a narcissistic object-choice is to be loved.

Further, it is easy to observe that libidinal object-cathexis does not raise self-regard. The effect of dependence upon the loved object is to lower that feeling: a person in love is humble. A person who loves has, so to speak, forfeited a part of his narcissism, and it can only be replaced by his being loved. In all these respects self-regard seems to remain related to the narcissistic element in love.

The realization of impotence, of one's own inability to love, in consequence of mental or physical disorder, has an exceedingly lowering effect upon self-regard. Here, in my judgement, we must look for one of the sources of the feelings of inferiority which are experienced by patients suffering from the transference neuroses and which they are so ready to report. The main source of these feelings is, however, the impoverishment of the ego, due to the extraordinarily large libidinal cathexes which have been withdrawn from it - due, that is to say, to the injury sustained by the ego through sexual trends which are no longer subject to control.

Adler is right in maintaining that when a person with an active mental life recognizes an inferiority in one of his organs, it acts as a spur and calls out a higher level of performance in him through overcompensation. But it would be altogether an exaggeration if, following Adler's example, we sought to attribute every successful achievement to this factor of an original inferiority of an organ. Not all artists are handicapped with bad eyesight, nor were all orators originally stammerers. And there are plenty of instances of excellent achievements springing from *superior* organic endowment. In the aetiology of neuroses organic inferiority and imperfect development play an insignificant part - much the same as that played by currently active perceptual material in the formation of dreams. Neuroses make use of such inferiorities as a pretext, just as they do of every other suitable factor. We may be tempted to believe a neurotic woman patient when she tells us that it was inevitable she should fall ill, since she is ugly, deformed or lacking in charm, so that no one could love her; but the very next neurotic will teach us better - for she persists in her neurosis and in her aversion to sexuality, although she seems more desirable, and is more desired, than the average woman. The majority of hysterical women are among the attractive and even beautiful representatives of their sex, while, on the other hand, the frequency of ugliness, organic defects and infirmities in the lower classes of society does not increase the incidence of neurotic illness among them.

The relations of self-regard to erotism - that is, to libidinal object-cathexes - may be expressed concisely in the following way. Two cases must be distinguished, according to whether the erotic cathexes are ego-syntonic, or, on the contrary, have suffered repression. In the former case (where the use made of the libido is ego-syntonic), love is assessed like any other activity of the ego. Loving in itself, in so far as it involves longing and deprivation, lowers self-regard; whereas being loved, having one's love returned, and possessing the loved object, raises it once more. When libido is repressed, the erotic cathexis is felt as a severe depletion of the ego, the satisfaction of love is impossible, and the re-enrichment of the ego can be effected only by a withdrawal of libido from its objects. The return of the object-libido to the ego and its transformation into narcissism represents, as it were, a happy love once more; and, on the other hand, it is also true that a real happy love corresponds to the primal condition in which object-libido and ego-libido cannot be distinguished.

The importance and extensiveness of the topic must be my justification for adding a few more remarks which are somewhat loosely strung together.

The development of the ego consists in a departure from primary narcissism and gives rise to a vigorous attempt to recover that state. This departure is brought about by means of the displacement of libido on to an ego ideal imposed from without; and satisfaction is brought about from fulfilling this ideal.

At the same time the ego has sent out the libidinal object-cathexes. It becomes impoverished in favour of these cathexes, just as it does in favour of the ego ideal, and it enriches itself once more from its satisfactions in respect of the object, just as it does by fulfilling its ideal.

One part of self-regard is primary - the residue of infantile narcissism; another part arises out of the omnipotence which is corroborated by experience (the fulfilment of the ego ideal), whilst a third part proceeds from the satisfaction of object-libido.

The ego ideal has imposed severe conditions upon the satisfaction of libido through objects; for it causes some of them to be rejected by means of its censor, as being incompatible. Where no such ideal has been formed, the sexual trend in question makes its appearance unchanged in the personality in the form of a perversion. To be their own ideal once more, in regard to sexual no less than other trends, as they were in childhood - this is what people strive to attain as their happiness.

Being in love consists in a flowing-over of ego-libido on to the object. It has the power to remove repressions and re-instate perversions. It exalts the sexual object into a sexual ideal. Since, with the object type (or attachment type), being in love occurs in virtue of the fulfilment of infantile conditions for loving, we may say that whatever fulfils that condition is idealized.

The sexual ideal may enter into an interesting auxiliary relation to the ego ideal. It may be used for substitutive satisfaction where narcissistic satisfaction encounters real hindrances. In that case a person will love in conformity with the narcissistic type of object-choice, will love what he once was and no longer is, or else what possesses the excellences which he never had at all (cf. (c)). The formula parallel to the one there stated runs thus: what possesses the excellence which the ego lacks for making it an ideal, is loved. This expedient is of special importance for the neurotic, who, on account of his excessive object-cathexes, is impoverished in his ego and is incapable of fulfilling his ego ideal. He then seeks a way back to narcissism from his prodigal expenditure of libido upon objects, by choosing a sexual ideal after the narcissistic type which possesses the excellences to which he cannot attain. This is the cure by love, which he generally prefers to cure by analysis. Indeed, he cannot believe in any other mechanism of cure; he usually brings expectations of this sort with him to the treatment and directs them towards the person of the physician. The patient's incapacity for love, resulting from his extensive repressions, naturally stands in the way of a therapeutic plan of this kind. An unintended result is often met with when, by means of the treatment, he has been partially freed from his repressions: he withdraws from further treatment in order to choose a love-object, leaving his cure to be continued by a life with someone he loves. We might be satisfied with this result, if it did not bring with it all the dangers of a crippling dependence upon his helper in need.

The ego ideal opens up an important avenue for the understanding of group psychology. In addition to its individual side, this ideal has a social side; it is also the common ideal of a family, a class or a nation. It binds not only a person's narcissistic libido, but also a considerable amount of his homosexual libido, which is in this way turned back into the ego. The want of satisfaction which arises from the non-fulfilment of this ideal liberates homosexual libido, and this is transformed into a sense of guilt (social anxiety). Originally this sense of guilt was a fear of punishment by the parents, or, more correctly, the fear of losing their love; later the parents are replaced by an indefinite number of fellow-men. The frequent causation of paranoia by an injury to the ego, by a frustration of satisfaction within the sphere of the ego ideal, is thus made more intelligible, as is the convergence of ideal-formation and sublimation in the ego ideal, as well as the involution of sublimations and the possible transformation of ideals in paraphrenic disorders.

INSTINCTS AND THEIR VICISSITUDES
(1915)

Intentionally left blank

INSTINCTS AND THEIR VICISSITUDES

We have often heard it maintained that sciences should be built up on clear and sharply defined basic concepts. In actual fact no science, not even the most exact, begins with such definitions. The true beginning of scientific activity consists rather in describing phenomena and then in proceeding to group, classify and correlate them. Even at the stage of description it is not possible to avoid applying certain abstract ideas to the material in hand, ideas derived from somewhere or other but certainly not from the new observations alone. Such ideas which will later become the basic concepts of the science are still more indispensable as the material is further worked over. They must at first necessarily possess some degree of indefiniteness; there can be no question of any clear delimitation of their content. So long as they remain in this condition, we come to an understanding about their meaning by making repeated references to the material of observation from which they appear to have been derived, but upon which, in fact, they have been imposed. Thus, strictly speaking, they are in the nature of conventions - although everything depends on their not being arbitrarily chosen but determined by their having significant relations to the empirical material, relations that we seem to sense before we can clearly recognize and demonstrate them. It is only after more thorough investigation of the field of observation that we are able to formulate its basic scientific concepts with increased precision, and progressively so to modify them that they become serviceable and consistent over a wide area. Then, indeed, the time may have come to confine them in definitions. The advance of knowledge, however, does not tolerate any rigidity even in definitions. Physics furnishes an excellent illustration of the way in which even 'basic concepts' that have been established in the form of definitions are constantly being altered in their content.

A conventional basic concept of this kind, which at the moment is still somewhat obscure but which is indispensable to us in psychology, is that of an 'instinct [*Trieb*]'. Let us try to give a content to it by approaching it from different angles.

First, from the angle of *physiology*. This has given us the concept of a 'stimulus' and the pattern of the reflex arc, according to which a stimulus applied to living tissue (nervous substance) *from* the outside is discharged by action *to* the outside. This action is expedient in so far as it withdraws the stimulated substance from the influence of the stimulus, removes it out of its range of operation.

What is the relation of 'instinct' to 'stimulus'? There is nothing to prevent our subsuming the concept of 'instinct' under that of 'stimulus' and saying that an instinct is a stimulus applied to the mind. But we are immediately set on our guard against *equating* instinct and mental stimulus. There are obviously other stimuli to the mind besides those of an instinctual kind, stimuli which behave far more like physiological ones. For example, when a strong light falls on the eye, it is not an instinctual stimulus; it *is* one, however, when a dryness of the mucous membrane of the pharynx or an irritation of the mucous membrane of the stomach makes itself felt.¹

We have now obtained the material necessary for distinguishing between instinctual stimuli and other (physiological) stimuli that operate on the mind. In the first place, an instinctual stimulus does not arise from the external world but from within the organism itself. For this reason it operates differently upon the mind and different actions are necessary in order to remove it. Further, all that is essential in a stimulus is covered if we assume that it operates with a single impact, so that it can be disposed of by a single expedient action. A typical instance of this is motor flight from the source of stimulation. These impacts may, of course, be repeated and summated, but that makes no difference to our notion of the process and to the conditions for the removal of the stimulus. An instinct, on the other hand, never operates as a force giving a *momentary* impact but always as a *constant* one. Moreover, since it impinges not from without but from within the organism, no flight can avail against it. A better term for an instinctual stimulus is a 'need'. What does away with a need is 'satisfaction'. This can be attained only by an appropriate ('adequate') alteration of the internal source of stimulation.

¹ Assuming, of course, that these internal processes are the organic basis of the respective needs of thirst and hunger.

Let us imagine ourselves in the situation of an almost entirely helpless living organism, as yet unorientated in the world, which is receiving stimuli in its nervous substance. This organism will very soon be in a position to make a first distinction and a first orientation. On the one hand, it will be aware of stimuli which can be avoided by muscular action (flight); these it ascribes to an external world. On the other hand, it will also be aware of stimuli against which such action is of no avail and whose character of constant pressure persists in spite of it; these stimuli are the signs of an internal world, the evidence of instinctual needs. The perceptual substance of the living organism will thus have found in the efficacy of its muscular activity a basis for distinguishing between an 'outside' and an 'inside'.

We thus arrive at the essential nature of instincts in the first place by considering their main characteristics - their origin in sources of stimulation within the organism and their appearance as a constant force - and from this we deduce one of their further features, namely, that no actions of flight avail against them. In the course of this discussion, however, we cannot fail to be struck by something that obliges us to make a further admission. In order to guide us in dealing with the field of psychological phenomena, we do not merely apply certain conventions to our empirical material as basic *concepts*; we also make use of a number of complicated *postulates*. We have already alluded to the most important of these, and all we need now do is to state it expressly. This postulate is of a biological nature, and makes use of the concept of 'purpose' (or perhaps of expediency) and runs as follows: the nervous system is an apparatus which has the function of getting rid of the stimuli that reach it, or of reducing them to the lowest possible level; or which, if it were feasible, would maintain itself in an altogether unstimulated condition. Let us for the present not take exception to the indefiniteness of this idea and let us assign to the nervous system the task - speaking in general terms - of *mastering stimuli*. We then see how greatly the simple pattern of the physiological reflex is complicated by the introduction of instincts. External stimuli impose only the single task of withdrawing from them; this is accomplished by muscular movements, one of which eventually achieves that aim and thereafter, being the expedient movement, becomes a hereditary disposition. Instinctual stimuli, which originate from within the organism, cannot be dealt with by this mechanism. Thus they make far higher demands on the nervous system and cause it to undertake involved and interconnected activities by which the external world is so changed as to afford satisfaction to the internal source of stimulation. Above all, they oblige the nervous system to renounce its ideal intention of keeping off stimuli, for they maintain an incessant and unavoidable afflux of stimulation. We may therefore well conclude that instincts and not external stimuli are the true motive forces behind the advances that have led the nervous system, with its unlimited capacities, to its present high level of development. There is naturally nothing to prevent our supposing that the instincts themselves are, at least in part, precipitates of the effects of external stimulation, which in the course of phylogenesis have brought about modifications in the living substance.

When we further find that the activity of even the most highly developed mental apparatus is subject to the pleasure principle, i. e. is automatically regulated by feelings belonging to the pleasure-unpleasure series, we can hardly reject the further hypothesis that these feelings reflect the manner in which the process of mastering stimuli takes place - certainly in the sense that unpleasurable feelings are connected with an increase and pleasurable feelings with a decrease of stimulus. We will, however, carefully preserve this assumption in its present highly indefinite form, until we succeed, if that is possible, in discovering what sort of relation exists between pleasure and unpleasure, on the one hand, and fluctuations in the amounts of stimulus affecting mental life, on the other. It is certain that many very various relations of this kind, and not very simple ones, are possible.

If now we apply ourselves to considering mental life from a *biological* point of view, an 'instinct' appears to us as a concept on the frontier between the mental and the somatic, as the psychical representative of the stimuli originating from within the organism and reaching the mind, as a measure of the demand made upon the mind for work in consequence of its connection with the body.

We are now in a position to discuss certain terms which are used in reference to the concept of an instinct - for example, its 'pressure', its 'aim', its 'object' and its 'source'.

By the pressure [*Drang*] of an instinct we understand its motor factor, the amount of force or the measure of the demand for work which it represents. The characteristic of exercising pressure is common to all instincts; it is in fact their very essence. Every instinct is a piece of activity; if we speak loosely of passive instincts, we can only mean instincts whose *aim* is passive.

The aim [*Ziel*] of an instinct is in every instance satisfaction, which can only be obtained by removing the state of stimulation at the source of the instinct. But although the ultimate aim of each instinct remains unchangeable, there may yet be different paths leading to the same ultimate aim; so that an instinct may be found to have various nearer or intermediate aims, which are combined or interchanged with one another. Experience permits us also to speak of instincts which are 'inhibited in their aim', in the case of processes which are allowed to make some advance towards instinctual satisfaction but are then inhibited or deflected. We may suppose that even processes of this kind involve a partial satisfaction.

The object [*Objekt*] of an instinct is the thing in regard to which or through which the instinct is able to achieve its aim. It is what is most variable about an instinct and is not originally connected with it, but becomes assigned to it only in consequence of being peculiarly fitted to make satisfaction possible. The object is not necessarily something extraneous: it may equally well be a part of the subject's own body. It may be changed any number of times in the course of the vicissitudes which the instinct undergoes during its existence; and highly important parts are played by this displacement of instinct. It may happen that the same object serves for the satisfaction of several instincts simultaneously, a phenomenon which Adler has called a 'confluence' of instincts [*Triebverschränkung*]. A particularly close attachment of the instinct to its object is distinguished by the term 'fixation'. This frequently occurs at very early periods of the development of an instinct and puts an end to its mobility through its intense opposition to detachment.

By the source [*Quelle*] of an instinct is meant the somatic process which occurs in an organ or part of the body and whose stimulus is represented in mental life by an instinct. We do not know whether this process is invariably of a chemical nature or whether it may also correspond to the release of other, e.g. mechanical, forces. The study of the sources of instincts lies outside the scope of psychology. Although instincts are wholly determined by their origin in a somatic source, in mental life we know them only by their aims. An exact knowledge of the sources of an instinct is not invariably necessary for purposes of psychological investigation; sometimes its source may be inferred from its aim.

Are we to suppose that the different instincts which originate in the body and operate on the mind are also distinguished by different *qualities*, and that that is why they behave in qualitatively different ways in mental life? This supposition does not seem to be justified; we are much more likely to find the simpler assumption sufficient - that the instincts are all qualitatively alike and owe the effect they make only to the amount of excitation they carry, or perhaps, in addition, to certain functions of that quantity. What distinguishes from one another the mental effects produced by the various instincts may be traced to the difference in their sources. In any event, it is only in a later connection that we shall be able to make plain what the problem of the quality of instincts signifies.

What instincts should we suppose there are, and how many? There is obviously a wide opportunity here for arbitrary choice. No objection can be made to anyone's employing the concept of an instinct of play or of destruction or of gregariousness, when the subject-matter demands it and the limitations of psychological analysis allow of it. Nevertheless, we should not neglect to ask ourselves whether instinctual motives like these, which are so highly specialized on the one hand, do not admit of further dissection in accordance with the *sources* of the instinct, so that only primal instincts - those which cannot be further dissected - can lay claim to importance.

I have proposed that two groups of such primal instincts should be distinguished: the *ego*, or *self-preserved*, instincts and the *sexual* instincts. But this supposition has not the status of a necessary postulate, as has, for instance, our assumption about the biological purpose of the mental apparatus (p. 2960); it is merely a working hypothesis, to be retained only so long as it proves useful, and it will make little difference to the results of our work of description and classification if it is replaced by another. The occasion for this hypothesis arose in the course of the evolution of psycho-analysis, which was first employed upon the psychoneuroses, or, more precisely, upon the group described as 'transference neuroses' (hysteria and obsessional neurosis); these showed that at the root of all such affections there is to be found a conflict between the claims of sexuality and those of the ego. It is always possible that an exhaustive study of the other neurotic affections (especially of the narcissistic psychoneuroses, the schizophrenias) may oblige us to alter this formula and to make a different classification of the primal instincts. But for the present we do not know of any such formula, nor have we met with any argument unfavourable to drawing this contrast between sexual and ego-instincts.

I am altogether doubtful whether any decisive pointers for the differentiation and classification of the instincts can be arrived at on the basis of working over the psychological material. This working-over seems rather itself to call for the application to the material of definite assumptions concerning instinctual life, and it would be a desirable thing if those assumptions could be taken from some other branch of knowledge and carried over to psychology. The contribution which biology has to make here certainly does not run counter to the distinction between sexual and ego-instincts. Biology teaches that sexuality is not to be put on a par with other functions of the individual; for its purposes go beyond the individual and have as their content the production of new individuals - that is, the preservation of the species. It shows, further, that two views, seemingly equally well-founded, may be taken of the relation between the ego and sexuality. On the one view, the individual is the principal thing, sexuality is one of its activities and sexual satisfaction one of its needs; while on the other view the individual is a temporary and transient appendage to the quasi-immortal germ-plasm, which is entrusted to him by the process of generation. The hypothesis that the sexual function differs from other bodily processes in virtue of a special chemistry is, I understand, also a postulate of the Ehrlich school of biological research.

Since a study of instinctual life from the direction of consciousness presents almost insuperable difficulties, the principal source of our knowledge remains the psycho-analytic investigation of mental disturbances. Psycho-analysis, however, in consequence of the course taken by its development, has hitherto been able to give us information of a fairly satisfactory nature only about the *sexual* instincts; for it is precisely that group which alone can be observed in isolation, as it were, in the psychoneuroses. With the extension of psycho-analysis to the other neurotic affections, we shall no doubt find a basis for our knowledge of the ego-instincts as well, though it would be rash to expect equally favourable conditions for observation in this further field of research.

This much can be said by way of a general characterization of the sexual instincts. They are numerous, emanate from a great variety of organic sources, act in the first instance independently of one another and only achieve a more or less complete synthesis at a late stage. The aim which each of them strives for is the attainment of 'organ-pleasure'; only when synthesis is achieved do they enter the service of the reproductive function and thereupon become generally recognizable as sexual instincts. At their first appearance they are attached to the instincts of self-preservation, from which they only gradually become separated; in their choice of object, too, they follow the paths that are indicated to them by the ego-instincts. A portion of them remains associated with the ego-instincts throughout life and furnishes them with libidinal components, which in normal functioning easily escape notice and are revealed clearly only by the onset of illness. They are distinguished by possessing the capacity to act vicariously for one another to a wide extent and by being able to change their objects readily. In consequence of the latter properties they are capable of functions which are far removed from their original purposive actions - capable, that is, of 'sublimation'.

Our inquiry into the various vicissitudes which instincts undergo in the process of development and in the course of life must be confined to the sexual instincts, which are the more familiar to us. Observation shows us that an instinct may undergo the following vicissitudes:-

Reversal into its opposite.
 Turning round upon the subject's own self.
 Repression.
 Sublimation.

Since I do not intend to treat of sublimation here and since repression requires a special chapter to itself, it only remains for us to describe and discuss the two first points. Bearing in mind that there are motive forces which work against an instinct's being carried through in an unmodified form, we may also regard these vicissitudes as modes of *defence* against the instincts.

Reversal of an instinct into its opposite resolves on closer examination into two different processes: a change from activity to passivity, and a reversal of its content. The two processes, being different in their nature, must be treated separately.

Examples of the first process are met with in the two pairs of opposites: sadism-masochism and scopophilia-exhibitionism. The reversal affects only the *aims* of the instincts. The active aim (to torture, to look at) is replaced by the passive aim (to be tortured, to be looked at). Reversal of *content* is found in the single instance of the transformation of love into hate.

The turning round of an instinct upon the subject's own self is made plausible by the reflection that masochism is actually sadism turned round upon the subject's own ego, and that exhibitionism includes looking at his own body. Analytic observation, indeed, leaves us in no doubt that the masochist shares in the enjoyment of the assault upon himself, and that the exhibitionist shares in the enjoyment of his exposure. The essence of the process is thus the change of the *object*, while the aim remains unchanged. We cannot fail to notice, however, that in these examples the turning round upon the subject's self and the transformation from activity to passivity converge or coincide.

To elucidate the situation, a more thorough investigation is essential.

In the case of the pair of opposites sadism-masochism, the process may be represented as follows:

- (a) Sadism consists in the exercise of violence or power upon some other person as object.
- (b) This object is given up and replaced by the subject's self. With the turning round upon the self the change from an active to a passive instinctual aim is also effected.
- (c) An extraneous person is once more sought as object; this person, in consequence of the alteration which has taken place in the instinctual aim, has to take over the role of the subject.

Case (c) is what is commonly termed masochism. Here, too, satisfaction follows along the path of the original sadism, the passive ego placing itself back in phantasy in its first role, which has now in fact been taken over by the extraneous subject. Whether there is, besides this, a more direct masochistic satisfaction is highly doubtful. A primary masochism, not derived from sadism in the manner I have described, seems not to be met with.¹ That it is not superfluous to assume the existence of stage (b) is to be seen from the behaviour of the sadistic instinct in obsessional neurosis. There there is a turning round upon the subject's self *without* an attitude of passivity towards another person: the change has only got as far as stage (b). The desire to torture has turned into self-torture and self-punishment, not into masochism. The active voice is changed, not into the passive, but into the reflexive, middle voice.

Our view of sadism is further prejudiced by the circumstance that this instinct, side by side with its general aim (or perhaps, rather, within it), seems to strive towards the accomplishment of a quite special aim - not only to humiliate and master, but, in addition, to inflict pains. Psycho-analysis would appear to show that the infliction of pain plays no part among the original purposive actions of the instinct. A sadistic child takes no account of whether or not he inflicts pains, nor does he intend to do so. But when once the transformation into masochism has taken place, the pains are very well fitted to provide a passive masochistic aim; for we have every reason to believe that sensations of pain, like other unpleasurable sensations, trench upon sexual excitation and produce a pleasurable condition, for the sake of which the subject will even willingly experience the unpleasure of pain. When once feeling pains has become a masochistic aim, the sadistic aim of *causing* pains can arise also, retrogressively; for while these pains are being inflicted on other people, they are enjoyed masochistically by the subject through his identification of himself with the suffering object. In both cases, of course, it is not the pain itself which is enjoyed, but the accompanying sexual excitation - so that this can be done especially conveniently from the sadistic position. The enjoyment of pain would thus be an aim which was originally masochistic, but which can only become an instinctual aim in someone who was originally sadistic.

¹ (Footnote added 1924:) In later works (cf. 'The Economic Problem of Masochism', 1924c) relating to problems of instinctual life I have expressed an opposite view.

For the sake of completeness I may add that feelings of pity cannot be described as a result of a transformation of instinct occurring in sadism, but necessitate the notion of a *reaction-formation* against that instinct. (For the difference, see later.)

Rather different and simpler findings are afforded by the investigation of another pair of opposites - the instincts whose respective aim is to look and to display oneself (scopophilia and exhibitionism, in the language of the perversions). Here again we may postulate the same stages as in the previous instance:- (a) Looking as an *activity* directed towards an extraneous object. (b) Giving up of the object and turning of the scopophilic instinct towards a part of the subject's own body; with this, transformation to passivity and setting up of a new aim - that of being looked at. (c) Introduction of a new subject to whom one displays oneself in order to be looked at by him. Here, too, it can hardly be doubted that the active aim appears before the passive, that looking precedes being looked at. But there is an important divergence from what happens in the case of sadism, in that we can recognize in the case of the scopophilic instinct a yet earlier stage than that described as (a). For the beginning of its activity the scopophilic instinct is auto-erotic: it has indeed an object, but that object is part of the subject's own body. It is only later that the instinct is led, by a process of comparison, to exchange this object for an analogous part of someone else's body - stage (a). This preliminary stage is interesting because it is the source of *both* the situations represented in the resulting pair of opposites, the one or the other according to which element in the original situation is changed. The following might serve as a diagrammatic picture of the scopophilic instinct:-

A preliminary stage of this kind is absent in sadism, which from the outset is directed upon an extraneous object, although it might not be altogether unreasonable to construct such a stage out of the child's efforts to gain control over his own limbs.¹

With regard to both the instincts which we have just taken as examples, it should be remarked that their transformation by a reversal from activity to passivity and by a turning round upon the subject never in fact involves the whole quota of the instinctual impulse. The earlier active direction of the instinct persists to some degree side by side with its later passive direction, even when the process of its transformation has been very extensive. The only correct statement to make about the scopophilic instinct would be that all the stages of its development, its auto-erotic, preliminary stage as well as its final active or passive form, co-exist alongside one another; and the truth of this becomes obvious if we base our opinion, not on the actions to which the instinct leads, but on the mechanism of its satisfaction. Perhaps, however, it is permissible to look at the matter and represent it in yet another way. We can divide the life of each instinct into a series of separate successive waves, each of which is homogeneous during whatever period of time it may last, and whose relation to one another is comparable to that of successive eruptions of lava. We can then perhaps picture the first, original eruption of the instinct as proceeding in an unchanged form and undergoing no development at all. The next wave would be modified from the outset -(being turned, for instance, from active to passive - and would then, with this new characteristic, be added to the earlier wave, and so on. If we were then to take a survey of the instinctual impulse from its beginning up to a given point, the succession of waves which we have described would inevitably present the picture of a definite development of the instinct.

¹ (*Footnote added 1924:*) Cf. p. 2965 n.

The fact that, at this later period of development of an instinctual impulse, its (passive) opposite may be observed alongside of it deserves to be marked by the very apt term introduced by Bleuler - 'ambivalence'.

This reference to the developmental history of instincts and the permanence of their intermediate stages should make the development of instincts fairly intelligible to us. Experience shows that the amount of demonstrable ambivalence varies greatly between individuals, groups and races. Marked instinctual ambivalence in a human being living at the present day may be regarded as an archaic inheritance, for we have reason to suppose that the part played in instinctual life by the active impulses in their unmodified form was greater in *primaeval* times than it is on an average to-day.

We have become accustomed to call the early phase of the development of the ego, during which its sexual instincts find auto-erotic satisfaction, 'narcissism', without at once entering on any discussion of the relation between auto-erotism and narcissism. It follows that the preliminary stage of the scopophilic instinct, in which the subject's own body is the object of the scopophilia, must be classed under narcissism, and that we must describe it as a narcissistic formation. The active scopophilic instinct develops from this, by leaving narcissism behind. The passive scopophilic instinct, on the contrary, holds fast to the narcissistic object. Similarly, the transformation of sadism into masochism implies a return to the narcissistic object. And in both these cases the narcissistic *subject* is, through identification, replaced by another, extraneous ego. If we take into account our constructed preliminary narcissistic stage of sadism, we shall be approaching a more general realization - namely, that the instinctual vicissitudes which consist in the instinct's being turned round upon the subject's own ego and undergoing reversal from activity to passivity are dependent on the narcissistic organization of the ego and bear the stamp of that phase. They perhaps correspond to the attempts at defence which at higher stages of the development of the ego are effected by other means.

At this point we may call to mind that so far we have considered only two pairs of opposite instincts: sadism-masochism and scopophilia-exhibitionism. These are the best known sexual instincts that appear in an ambivalent manner. The other components of the later sexual function are not yet sufficiently accessible to analysis for us to be able to discuss them in a similar way. In general we can assert of them that their activities are *auto-erotic*; that is to say, their object is negligible in comparison with the organ which is their source, and as a rule coincides with that organ. The object of the scopophilic instinct, however, though it too is in the first instance a part of the subject's own body, is not the eye itself; and in sadism the organic source, which is probably the muscular apparatus with its capacity for action, points unequivocally at an object other than itself, even though that object is part of the subject's own body. In the auto-erotic instincts, the part played by the organic source is so decisive that, according to a plausible suggestion of Federn (1913) and Jekels (1913), the form and function of the organ determine the activity or passivity of the instinctual aim.

The change of the *content* of an instinct into its opposite is observed in a single instance only - the transformation of *love into hate*. Since it is particularly common to find both these directed simultaneously towards the same object, their co-existence furnishes the most important example of ambivalence of feeling.

The case of love and hate acquires a special interest from the circumstance that it refuses to be fitted into our scheme of the instincts. It is impossible to doubt that there is the most intimate relation between these two opposite feelings and sexual life, but we are naturally unwilling to think of love as being some kind of special component instinct of sexuality in the same way as the others we have been discussing. We should prefer to regard loving as the expression of the *whole* sexual current of feeling; but this idea does not clear up our difficulties, and we cannot see what meaning to attach to an opposite content of this current.

Loving admits not merely of one, but of three opposites. In addition to the antithesis 'loving-hating', there is the other one of 'loving-being loved'; and, in addition to these, loving and hating taken together are the opposite of the condition of unconcern or indifference. The second of these three antitheses, loving-being loved, corresponds exactly to the transformation from activity to passivity and may be traced to an underlying situation in the same way as in the case of the scopophilic instinct. This situation is that of *loving oneself* which we regard as the characteristic feature of narcissism. Then, according as the object or the subject is replaced by an extraneous one, what results is the active aim of loving or the passive one of being loved - the latter remaining near to narcissism.

Perhaps we shall come to a better understanding of the several opposites of loving if we reflect that our mental life as a whole is governed by *three polarities*, the antitheses

Subject (ego) - Object (external world),

Pleasure - Unpleasure, and

Active - Passive.

The antithesis ego - non-ego (external), i. e. subject-object, is, as we have already said, thrust upon the individual organism at an early stage, by the experience that it can silence *external* stimuli by means of muscular action but is defenceless against *instinctual* stimuli. This antithesis remains, above all, sovereign in our intellectual activity and creates for research the basic situation which no efforts can alter. The polarity of pleasure-unpleasure is attached to a scale of feelings, whose paramount importance in determining our actions (our will) has already been emphasized. The antithesis active-passive must not be confused with the antithesis ego-subject - external world-object. The relation of the ego to the external world is passive in so far as it receives stimuli from it and active when it reacts to these. It is forced by its instincts into a quite special degree of activity towards the external world, so that we might bring out the essential point if we say that the ego-subject is passive in respect of external stimuli but active through its own instincts. The antithesis active-passive coalesces later with the antithesis masculine-feminine, which, until this has taken place, has no psychological meaning. The coupling of activity with masculinity and of passivity with femininity meets us, indeed, as a biological fact; but it is by no means so invariably complete and exclusive as we are inclined to assume.

The three polarities of the mind are connected with one another in various highly significant ways. There is a primal psychical situation in which two of them coincide. Originally, at the very beginning of mental life, the ego is cathected with instincts and is to some extent capable of satisfying them on itself. We call this condition 'narcissism' and this way of obtaining satisfaction 'auto-erotic'.¹ At this time the external world is not cathected with interest (in a general sense) and is indifferent for purposes of satisfaction. During this period, therefore, the ego-subject coincides with what is pleasurable and the external world with what is indifferent (or possibly unpleasurable, as being a source of stimulation). If for the moment we define loving as the relation of the ego to its sources of pleasure, the situation in which the ego loves itself only and is indifferent to the external world illustrates the first of the opposites which we found to 'loving'.

¹ Some of the sexual instincts are, as we know, capable of this auto-erotic satisfaction, and so are adapted to being the vehicle for the development under the dominance of the pleasure principle which we are about to describe. Those sexual instincts which from the outset require an object, and the needs of the ego-instincts, which are never capable of auto-erotic satisfaction, naturally disturb this state and so pave the way for an advance from it. Indeed, the primal narcissistic state would not be able to follow the development if it were not for the fact that every individual passes through a period during which he is helpless and has to be looked after and during which his pressing needs are satisfied by an external agency and are thus prevented from becoming greater.

In so far as the ego is auto-erotic, it has no need of the external world, but, in consequence of experiences undergone by the instincts of self-preservation, it acquires objects from that world, and, in spite of everything, it cannot avoid feeling internal instinctual stimuli for a time as unpleasurable. Under the dominance of the pleasure principle a further development now takes place in the ego. In so far as the objects which are presented to it are sources of pleasure, it takes them into itself, 'introjects' them (to use Ferenczi's term); and, on the other hand, it expels whatever within itself becomes a cause of unpleasure. (See below, the mechanism of projection.)

Thus the original 'reality-ego', which distinguished internal and external by means of a sound objective criterion, changes into a purified 'pleasure-ego', which places the characteristic of pleasure above all others. For the pleasure-ego the external world is divided into a part that is pleasurable, which it has incorporated into itself, and a remainder that is extraneous to it. It has separated off a part of its own self, which it projects into the external world and feels as hostile. After this new arrangement, the two polarities coincide once more: the ego-subject coincides with pleasure, and the external world with unpleasure (with what was earlier indifference).

When, during the stage of primary narcissism, the object makes its appearance, the second opposite to loving, namely hating, also attains its development.

As we have seen, the object is brought to the ego from the external world in the first instance by the instincts of self-preservation; and it cannot be denied that hating, too, originally characterized the relation of the ego to the alien external world with the stimuli it introduces. Indifference falls into place as a special case of hate or dislike, after having first appeared as their forerunner. At the very beginning, it seems, the external world, objects, and what is hated are identical. If later on an object turns out to be a source of pleasure, it is loved, but it is also incorporated into the ego; so that for the purified pleasure-ego once again objects coincide with what is extraneous and hated.

Now, however, we may note that just as the pair of opposites love-indifference reflects the polarity ego-external world, so the second antithesis love-hate reproduces the polarity pleasure-unpleasure, which is linked to the first polarity. When the purely narcissistic stage has given place to the object-stage, pleasure and unpleasure signify relations of the ego to the object. If the object becomes a source of pleasurable feelings, a motor urge is set up which seeks to bring the object closer to the ego and to incorporate it into the ego. We then speak of the 'attraction' exercised by the pleasure-giving object, and say that we 'love' that object. Conversely, if the object is a source of unpleasurable feelings, there is an urge which endeavours to increase the distance between the object and the ego and to repeat in relation to the object the original attempt at flight from the external world with its emission of stimuli. We feel the 'repulsion' of the object, and hate it; this hate can afterwards be intensified to the point of an aggressive inclination against the object - an intention to destroy it.

We might at a pinch say of an instinct that it 'loves' the objects towards which it strives for purposes of satisfaction; but to say that an instinct 'hates' an object strikes us as odd. Thus we become aware that the attitudes of love and hate cannot be made use of for the relations of *instincts* to their objects, but are reserved for the relations of the *total ego* to objects. But if we consider linguistic usage, which is certainly not without significance, we shall see that there is a further limitation to the meaning of love and hate. We do not say of objects which serve the interests of self-preservation that we *love* them; we emphasize the fact that we *need* them, and perhaps express an additional, different kind of relation to them by using words that denote a much reduced degree of love - such as, for example, 'being fond of', 'liking' or 'finding agreeable'.

Thus the word 'to love' moves further and further into the sphere of the pure pleasure-relation of the ego to the object and finally becomes fixed to sexual objects in the narrower sense and to those which satisfy the needs of sublimated sexual instincts. The distinction between the ego-instincts and the sexual instincts which we have imposed upon our psychology is thus seen to be in conformity with the spirit of our language. The fact that we are not in the habit of saying of a single sexual instinct that it loves its object, but regard the relation of the ego to its sexual object as the most appropriate case in which to employ the word 'love' - this fact teaches us that the word can only begin to be applied in this relation after there has been a synthesis of all the component instincts of sexuality under the primacy of the genitals and in the service of the reproductive function.

It is noteworthy that in the use of the word 'hate' no such intimate connection with sexual pleasure and the sexual function appears. The relation of *unpleasure* seems to be the sole decisive one. The ego hates, abhors and pursues with intent to destroy all objects which are a source of unpleasurable feeling for it, without taking into account whether they mean a frustration of sexual satisfaction or of the satisfaction of self-preservative needs. Indeed, it may be asserted that the true prototypes of the relation of hate are derived not from sexual life, but from the ego's struggle to preserve and maintain itself.

So we see that love and hate, which present themselves to us as complete opposites in their content, do not after all stand in any simple relation to each other. They did not arise from the cleavage of any originally common entity, but sprang from different sources, and had each its own development before the influence of the pleasure-unpleasure relation made them into opposites.

It now remains for us to put together what we know of the genesis of love and hate. Love is derived from the capacity of the ego to satisfy some of its instinctual impulses auto-erotically by obtaining organ-pleasure. It is originally narcissistic, then passes over on to objects, which have been incorporated into the extended ego, and expresses the motor efforts of the ego towards these objects as sources of pleasure. It becomes intimately linked with the activity of the later sexual instincts and, when these have been completely synthesized, coincides with the sexual impulsion as a whole. Preliminary stages of love emerge as provisional sexual aims while the sexual instincts are passing through their complicated development. As the first of these aims we recognize the phase of incorporating or devouring - a type of love which is consistent with abolishing the object's separate existence and which may therefore be described as ambivalent. At the higher stage of the pregenital sadistic-anal organization, the striving for the object appears in the form of an urge for mastery, to which injury or annihilation of the object is a matter of indifference. Love in this form and at this preliminary stage is hardly to be distinguished from hate in its attitude towards the object. Not until the genital organization is established does love become the opposite of hate.

Hate, as a relation to objects, is older than love. It derives from the narcissistic ego's primordial repudiation of the external world with its outpouring of stimuli. As an expression of the reaction of unpleasure evoked by objects, it always remains in an intimate relation with the self-preservative instincts; so that sexual and ego-instincts can readily develop an antithesis which repeats that of love and hate. When the ego-instincts dominate the sexual function, as is the case at the stage of the sadistic-anal organization, they impart the qualities of hate to the instinctual aim as well.

The history of the origins and relations of love makes us understand how it is that love so frequently manifests itself as 'ambivalent' - i.e. as accompanied by impulses of hate against the same object. The hate which is admixed with the love is in part derived from the preliminary stages of loving which have not been wholly surmounted; it is also in part based on reactions of repudiation by the ego-instincts, which, in view of the frequent conflicts between the interests of the ego and those of love, can find grounds in real and contemporary motives. In both cases, therefore, the admixed hate has as its source the self-preservative instincts. If a love-relation with a given object is broken off, hate not infrequently emerges in its place, so that we get the impression of a transformation of love into hate. This account of what happens leads on to the view that the hate, which has its real motives, is here reinforced by a regression of the love to the sadistic preliminary stage; so that the hate acquires an erotic character and the continuity of a love relation is ensured.

The third antithesis of loving, the transformation of loving into being loved, corresponds to the operation of the polarity of activity and passivity, and is to be judged in the same way as the cases of scopophilia and sadism.

We may sum up by saying that the essential feature in the vicissitudes undergone by instincts lies in *the subjection of the instinctual impulses to the influences of the three great polarities that dominate mental life*. Of these three polarities we might describe that of activity-passivity as the *biological*, that of ego-external world as the *real*, and finally that of pleasure-unpleasure as the *economic* polarity.

The instinctual vicissitude of *repression* will form the subject of an inquiry which follows.

REPRESSION
(1915)

REPRESSION

One of the vicissitudes an instinctual impulse may undergo is to meet with resistances which seek to make it inoperative. Under certain conditions, which we shall presently investigate more closely, the impulse then passes into the state of 'repression' [*Verdrängung*]. If what was in question was the operation of an external stimulus, the appropriate method to adopt would obviously be flight; with an instinct, flight is of no avail, for the ego cannot escape from itself. At some later period, rejection based on judgement (*condemnation*) will be found to be a good method to adopt against an instinctual impulse. Repression is a preliminary stage of condemnation, something between flight and condemnation; it is a concept which could not have been formulated before the time of psycho-analytic studies.

It is not easy in theory to deduce the possibility of such a thing as repression. Why should an instinctual impulse undergo a vicissitude like this? A necessary condition of its happening must clearly be that the instinct's attainment of its aim should produce unpleasure instead of pleasure. But we cannot well imagine such a contingency. There are no such instincts: satisfaction of an instinct is always pleasurable. We should have to assume certain peculiar circumstances, some sort of process by which the pleasure of satisfaction is changed into unpleasure.

In order the better to delimit repression, let us discuss some other instinctual situations. It may happen that an external stimulus becomes internalized - for example, by eating into and destroying some bodily organ - so that a new source of constant excitation and increase of tension arises. The stimulus thereby acquires a far-reaching similarity to an instinct. We know that a case of this sort is experienced by us as *pain*. The aim of this pseudo-instinct, however, is simply the cessation of the change in the organ and of the unpleasure accompanying it. There is no other direct pleasure to be attained by cessation of pain. Further, pain is imperative; the only things to which it can yield are removal by some toxic agent or the influence of mental distraction.

The case of pain is too obscure to give any help in our purpose. Let us take the case in which an instinctual stimulus such as hunger remains unsatisfied. It then becomes imperative and can be allayed by nothing but the action that satisfies it; it keeps up a constant tension of need. Nothing in the nature of a repression seems in this case to come remotely into question.

Thus repression certainly does not arise in cases where the tension produced by lack of satisfaction of an instinctual impulse is raised to an unbearable degree. The methods of defence which are open to the organism against that situation must be discussed in another connection.

Let us rather confine ourselves to clinical experience, as we meet with it in psycho-analytic practice. We then learn that the satisfaction of an instinct which is under repression would be quite possible, and further, that in every instance such a satisfaction would be pleasurable in itself; but it would be irreconcilable with other claims and intentions. It would, therefore, cause pleasure in one place and unpleasure in another. It has consequently become a condition for repression that the motive force of unpleasure shall have acquired more strength than the pleasure obtained from satisfaction. Psycho-analytic observation of the transference neuroses, moreover, leads us to conclude that repression is not a defensive mechanism which is present from the very beginning, and that it cannot arise until a sharp cleavage has occurred between conscious and unconscious mental activity - that *the essence of repression lies simply in turning something away, and keeping it at a distance, from the conscious*. This view of repression would be made more complete by assuming that, before the mental organization reaches this stage, the task of fending off instinctual impulses is dealt with by the other vicissitudes which instincts may undergo - e.g. reversal into the opposite or turning round upon the subject's own self.

It seems to us now that, in view of the very great extent to which repression and what is unconscious are correlated, we must defer probing more deeply into the nature of repression until we have learnt more about the structure of the succession of psychical agencies and about the differentiation between what is unconscious and conscious. Till then, all we can do is to put together in a purely descriptive fashion a few characteristics of repression that have been observed clinically, even though we run the risk of having to repeat unchanged much that has been said elsewhere.

We have reason to assume that there is a *primal repression*, a first phase of repression, which consists in the psychical (ideational) representative of the instinct being denied entrance into the conscious. With this *fixation* is established; the representative in question persists unaltered from then onwards and the instinct remains attached to it. This is due to the properties of unconscious processes of which we shall speak later.

The second stage of repression, *repression proper*, affects mental derivatives of the repressed representative, or such trains of thought as, originating elsewhere, have come into associative connection with it. On account of this association, these ideas experience the same fate as what was primally repressed. Repression proper, therefore, is actually an after-pressure [*Nachdrängen*]. Moreover, it is a mistake to emphasize only the repulsion which operates from the direction of the conscious upon what is to be repressed; quite as important is the attraction exercised by what was primally repressed upon everything with which it can establish a connection. Probably the trend towards repression would fail in its purpose if these two forces did not co-operate, if there were not something previously repressed ready to receive what is repelled by the conscious.

Under the influence of the study of the psychoneuroses, which brings before us the important effects of repression, we are inclined to overvalue their psychological bearing and to forget too readily that repression does not hinder the instinctual representative from continuing to exist in the unconscious, from organizing itself further, putting out derivatives and establishing connections. Repression in fact interferes only with the relation of the instinctual representative to *one* psychical system, namely, to that of the conscious.

Psycho-analysis is able to show us other things as well which are important for understanding the effects of repression in the psychoneuroses. It shows us, for instance, that the instinctual representation develops with less interference and more profusely if it is withdrawn by repression from conscious influence. It proliferates in the dark, as it were, and takes on extreme forms of expression, which when they are translated and presented to the neurotic are not only bound to seem alien to him, but frighten him by giving him the picture of an extraordinary and dangerous strength of instinct. This deceptive strength of instinct is the result of an uninhibited development in phantasy and of the damming-up consequent on frustrated satisfaction. The fact that this last result is bound up with repression points the direction in which the true significance of repression has to be looked for.

Reverting once more, however, to the opposite aspect of repression, let us make it clear that it is not even correct to suppose that repression withholds from the conscious *all* the derivatives of what was primally repressed. If these derivatives have become sufficiently far removed from the repressed representative, whether owing to the adoption of distortions or by reason of the number of intermediate links inserted, they have free access to the conscious. It is as though the resistance of the conscious against them was a function of their distance from what was originally repressed. In carrying out the technique of psycho-analysis, we continually require the patient to produce such derivatives of the repressed as, in consequence either of their remoteness or of their distortion, can pass the censorship of the conscious. Indeed, the associations which we require him to give without being influenced by any conscious purposive idea and without any criticism, and from which we reconstitute a conscious translation of the repressed representative - these associations are nothing else than remote and distorted derivatives of this kind. During this process we observe that the patient can go on spinning a thread of such associations, till he is brought up against some thought, the relation of which to what is repressed becomes so obvious that he is compelled to repeat his attempt at repression. Neurotic symptoms, too, must have fulfilled this same condition, for they are derivatives of the repressed, which has, by their means, finally won the access to consciousness which was previously denied to it.

We can lay down no general rule as to what degree of distortion and remoteness is necessary before the resistance on the part of the conscious is removed. A delicate balancing is here taking place, the play of which is hidden from us; its mode of operation, however, enables us to infer that it is a question of calling a halt when the cathexis of the unconscious reaches a certain intensity - an intensity beyond which the unconscious would break through to satisfaction. Repression acts, therefore, in a *highly individual* manner. Each single derivative of the repressed may have its own special vicissitude; a little more or a little less distortion alters the whole outcome. In this connection we can understand how it is that the objects to which men give most preference, their ideals, proceed from the same perceptions and experiences as the objects which they most abhor, and that they were originally only distinguished from one another through slight modifications. Indeed, as we found in tracing the origin of the fetish, it is possible for the original instinctual representative to be split in two, one part undergoing repression, while the remainder, precisely on account of this intimate connection, undergoes idealization.

The same result as follows from an increase or a decrease in the degree of distortion may also be achieved at the other end of the apparatus, so to speak, by a modification in the condition for the production of pleasure and unpleasure. Special techniques have been evolved, with the purpose of bringing about such changes in the play of mental forces that what would otherwise give rise to unpleasure may on this occasion result in pleasure; and, whenever a technical device of this sort comes into operation, the repression of an instinctual representative which would otherwise be repudiated is lifted. These techniques have till now only been studied in any detail in jokes. As a rule the repression is only temporarily lifted and is promptly re-instated.

Observations like this, however, enable us to note some further characteristics of repression. Not only is it, as we have just shown, *individual* in its operation, but it is also exceedingly *mobile*. The process of repression is not to be regarded as an event which takes place once, the results of which are permanent, as when some living thing has been killed and from that time onward is dead; repression demands a persistent expenditure of force, and if this were to cease the success of the repression would be jeopardized, so that a fresh act of repression would be necessary. We may suppose that the repressed exercises a continuous pressure in the direction of the conscious, so that this pressure must be balanced by an unceasing counter-pressure. Thus the maintenance of a repression involves an uninterrupted expenditure of force, while its removal results in a saving from an economic point of view. The mobility of repression, incidentally, also finds expression in the psychical characteristics of the state of sleep, which alone renders possible the formation of dreams. With a return to waking life the repressive cathexes which have been drawn in are once more sent out.

Finally, we must not forget that after all we have said very little about an instinctual impulse when we have established that it is repressed. Without prejudice to its repression, such an impulse may be in widely different states. It may be inactive, i.e. only very slightly cathected with mental energy; or it may be cathected in varying degrees, and so enabled to be active. True, its activation will not result in a direct lifting of the repression, but it will set in motion all the processes which end in a penetration by the impulse into consciousness along circuitous paths. With unrepressed derivatives of the unconscious the fate of a particular idea is often decided by the degree of its activity or cathexis. It is an everyday occurrence that such a derivative remains unrepressed so long as it represents only a small amount of energy, although its content would be calculated to give rise to a conflict with what is dominant in consciousness. The quantitative factor proves decisive for this conflict: as soon as the basically obnoxious idea exceeds a certain degree of strength, the conflict becomes a real one, and it is precisely this activation that leads to repression. So that, where repression is concerned, an increase of energetic cathexis operates in the same sense as an approach to the unconscious, while a decrease of that cathexis operates in the same sense as remoteness from the unconscious or distortion. We see that the repressive trends may find a substitute for repression in a weakening of what is distasteful.

In our discussion so far we have dealt with the repression of an instinctual representative, and by the latter we have understood an idea or group of ideas which is cathected with a definite quota of psychical energy (libido or interest) coming from an instinct. Clinical observation now obliges us to divide up what we have hitherto regarded as a single entity; for it shows us that besides the idea, some other element representing the instinct has to be taken into account, and that this other element undergoes vicissitudes of repression which may be quite different from those undergone by the idea. For this other element of the psychical representative the term *quota of affect* has been generally adopted. It corresponds to the instinct in so far as the latter has become detached from the idea and finds expression, proportionate to its quantity, in processes which are sensed as affects. From this point on, in describing a case of repression, we shall have to follow up separately what, as the result of repression, becomes of the *idea*, and what becomes of the instinctual energy linked to it.

We should be glad to be able to say something general about the vicissitudes of both; and having taken our bearings a little we shall in fact be able to do so. The general vicissitude which overtakes the *idea* that represents the instinct can hardly be anything else than that it should vanish from the conscious if it was previously conscious, or that it should be held back from consciousness if it was about to become conscious. The difference is not important; it amounts to much the same thing as the difference between my ordering an undesirable guest out of my drawing-room (or out of my front hall), and my refusing, after recognizing him, to let him cross my threshold at all.¹ The *quantitative* factor of the instinctual representative has three possible vicissitudes, as we can see from a cursory survey of the observations made by psycho-analysis: either the instinct is altogether suppressed, so that no trace of it is found, or it appears as an affect which is in some way or other qualitatively coloured, or it is changed into anxiety. The two latter possibilities set us the task of taking into account, as a further instinctual vicissitude, the *transformation* into *affects*, and especially into *anxiety*, of the psychical energies of *instincts*.

We recall the fact that the motive and purpose of repression has nothing else than the avoidance of unpleasure. It follows that the vicissitude of the quota of affect belonging to the representative is far more important than the vicissitude of the idea, and this fact is decisive for our assessment of the process of repression. If a repression does not succeed in preventing feelings of unpleasure or anxiety from arising, we may say that it has failed, even though it may have achieved its purpose as far as the ideational portion is concerned. Repressions that have failed will of course have more claim on our interest than any that may have been successful; for the latter will for the most part escape our examination.

¹ This simile, which is thus applicable to the process of repression, may also be extended to a characteristic of it which has been mentioned earlier: I have merely to add that I must set a permanent guard over the door which I have forbidden this guest to enter, since he would otherwise burst it open. (See above.)

We must now try to obtain some insight into the *mechanism* of the process of repression. In particular we want to know whether there is a single mechanism only, or more than one, and whether perhaps each of the psychoneuroses is distinguished by a mechanism of repression peculiar to it. At the outset of this enquiry, however, we are met by complications. The mechanism of a repression becomes accessible to us only by our deducing that mechanism from the *outcome* of the repression. Confining our observations to the effect of repression on the ideational portion of the representative, we discover that as a rule it creates a *substitutive formation*. What is the mechanism by which such a substitute is formed? Or should we distinguish several mechanisms here as well? Further, we know that repression leaves *symptoms* behind it. May we then suppose that the forming of substitutes and the forming of symptoms coincide, and, if this is so on the whole, is the mechanism of forming symptoms the same as that of repression? The general probability would seem to be that the two are widely different, and that it is not the repression itself which produces substitutive formations and symptoms, but that these latter are indications of a *return of the repressed* and owe their existence to quite other processes. It would also seem advisable to examine the mechanisms by which substitutes and symptoms are formed before considering the mechanisms of repression.

Obviously this is no subject for further speculation. The place of speculation must be taken by a careful analysis of the results of repression observable in the different neuroses. I must, however, suggest that we should postpone this task, too, until we have formed reliable conceptions of the relation of the conscious to the unconscious. But, in order that the present discussion may not be entirely unfruitful, I will say in advance that (1) the mechanism of repression does not in fact coincide with the mechanism or mechanisms of forming substitutes, (2) there are a great many different mechanisms of forming substitutes and (3) the mechanisms of repression have at least this one thing in common: a *withdrawal of the cathexis of energy* (or of *libido*, where we are dealing with sexual instincts).

Further, restricting myself to the three best-known forms of psychoneurosis, I will show by means of some examples how the concepts here introduced find application to the study of repression.

From the field of *anxiety hysteria* I will choose a well-analysed example of an animal phobia. The instinctual impulse subjected to repression here is a libidinal attitude towards the father, coupled with fear of him. After repression, this impulse vanishes out of consciousness: the father does not appear in it as an object of libido. As a substitute for him we find in a corresponding place some animal which is more or less fitted to be an object of anxiety. The formation of the substitute for the ideational portion has come about by *displacement* along a chain of connections which is determined in a particular way. The quantitative portion has not vanished, but has been transformed into anxiety. The result is fear of a wolf, instead of a demand for love from the father. The categories here employed are of course not enough to supply an adequate explanation of even the simplest case of psychoneurosis: there are always other considerations to be taken into account. A repression such as occurs in an animal phobia must be described as radically unsuccessful. All that it has done is to remove and replace the idea; it has failed altogether in sparing unpleasure. And for this reason, too, the work of the neurosis does not cease. It proceeds to a second phase, in order to attain its immediate and more important purpose. What follows is an attempt at flight - the formation of the *phobia proper*, of a number of avoidances which are intended to prevent a release of the anxiety. More specialized investigation enables us to understand the mechanism by which the phobia achieves its aim.

We are obliged to take quite another view of the process of repression when we consider the picture of a true *conversion hysteria*. Here the salient point is that it is possible to bring about a total disappearance of the quota of affect. When this is so, the patient displays towards his symptoms what Charcot called '*la belle indifférence hystériques*'. In other cases this suppression is not so completely successful: some distressing sensations may attach to the symptoms themselves, or it may prove impossible to prevent some release of anxiety, which in turn sets to work the mechanism of forming a phobia. The ideational content of the instinctual representative is completely withdrawn from consciousness; as a substitute - and at the same time as a symptom - we have an over-strong innervation (in typical cases, a somatic one), sometimes of a sensory, sometimes of a motor character, either as an excitation or an inhibition. The over-innervated area proves on a closer view to be a part of the repressed instinctual representative itself - a part which, as though by a process of *condensation*, has drawn the whole cathexis on to itself. These remarks do not of course bring to light the whole mechanism of a conversion hysteria; in especial the factor of *regression*, which will be considered in another connection, has also to be taken into account. In so far as repression in hysteria is made possible only by the extensive formation of substitutes, it may be judged to be entirely unsuccessful; as regards dealing with the quota of affect, however, which is the true task of repression, it generally signifies a total success. In conversion hysteria the process of repression is completed with the formation of the symptom and does not, as in anxiety hysteria, need to continue to a second phase - or rather, strictly speaking, to continue endlessly.

A totally different picture of repression is shown, once more, in the third disorder which we shall consider for the purposes of our illustration - in *obsessional neurosis*. Here we are at first in doubt what it is that we have to regard as the instinctual representative that is subjected to repression - whether it is a libidinal or a hostile trend. This uncertainty arises because obsessional neurosis has as its basis a regression owing to which a sadistic trend has been substituted for an affectionate one. It is this hostile impulsion against someone who is loved which is subjected to repression. The effect at an early stage of the work of repression is quite different from what it is at a later one. At first the repression is completely successful; the ideational content is rejected and the affect made to disappear. As a substitutive formation there arises an alteration in the ego in the shape of an increased conscientiousness, and this can hardly be called a symptom. Here, substitute and symptom do not coincide. From this we learn something, too, about the mechanism of repression. In this instance, as in all others, repression has brought about a withdrawal of libido; but here it has made use of *reaction-formation* for this purpose, by intensifying an opposite. Thus in this case the formation of a substitute has the same mechanism as repression and at bottom coincides with it, while chronologically, as well as conceptually, it is distinct from the formation of a symptom. It is very probable that the whole process is made possible by the ambivalent relationship into which the sadistic impulsion that has to be repressed has been introduced. But the repression, which was at first successful, does not hold firm; in the further course of things its failure becomes increasingly marked. The ambivalence which has enabled repression through reaction-formation to take place is also the point at which the repressed succeeds in returning. The vanished affect comes back in its transformed shape as social anxiety, moral anxiety and unlimited self-reproaches; the rejected idea is replaced by a *substitute by displacement*, often a displacement on to something very small or indifferent. A tendency to a complete re-establishment of the repressed idea is as a rule unmistakably present. The failure in the repression of the quantitative, affective factor brings into play the same mechanism of flight, by means of avoidance and prohibitions, as we have seen at work in the formation of hysterical phobias. The rejection of the *idea* from the conscious is, however, obstinately maintained, because it entails abstention from action, a motor fettering of the impulsion. Thus in obsessional neurosis the work of repression is prolonged in a sterile and interminable struggle.

The short series of comparisons presented here may easily convince us that more comprehensive investigations are necessary before we can hope thoroughly to understand the processes connected with repression and the formation of neurotic symptoms. The extraordinary intricacy of all the factors to be taken into consideration leaves only one way of presenting them open to us. We must select first one and then another point of view, and follow it up through the material as long as the application of it seems to yield results. Each separate treatment of the subject will be incomplete in itself, and there cannot fail to be obscurities where it touches upon material that has not yet been treated; but we may hope that a final synthesis will lead to a proper understanding.

THE UNCONSCIOUS
(1915)

Intentionally left blank

THE UNCONSCIOUS

We have learnt from psycho-analysis that the essence of the process of repression lies, not in putting an end to, in annihilating, the idea which represents an instinct, but in preventing it from becoming conscious. When this happens we say of the idea that it is in a state of being 'unconscious', and we can produce good evidence to show that even when it is unconscious it can produce effects, even including some which finally reach consciousness. Everything that is repressed must remain unconscious; but let us state at the very outset that the repressed does not cover everything that is unconscious. The unconscious has the wider compass: the repressed is a part of the unconscious.

How are we to arrive at a knowledge of the unconscious? It is of course only as something conscious that we know it, after it has undergone transformation or translation into something conscious. Psycho-analytic work shows us every day that translation of this kind is possible. In order that this should come about, the person under analysis must overcome certain resistances - the same resistances as those which, earlier, made the material concerned into something repressed by rejecting it from the conscious.

I. JUSTIFICATION FOR THE CONCEPT OF THE UNCONSCIOUS

Our right to assume the existence of something mental that is unconscious and to employ that assumption for the purposes of scientific work is disputed in many quarters. To this we can reply that our assumption of the unconscious is *necessary* and *legitimate*, and that we possess numerous proofs of its existence.

It is *necessary* because the data of consciousness have a very large number of gaps in them; both in healthy and in sick people psychical acts often occur which can be explained only by presupposing other acts, of which, nevertheless, consciousness affords no evidence. These not only include parapraxes and dreams in healthy people, and everything described as a psychical symptom or an obsession in the sick; our most personal daily experience acquaints us with ideas that come into our head we do not know from where, and with intellectual conclusions arrived at we do not know how. All these conscious acts remain disconnected and unintelligible if we insist upon claiming that every mental act that occurs in us must also necessarily be experienced by us through consciousness; on the other hand, they fall into a demonstrable connection if we interpolate between them the unconscious acts which we have inferred. A gain in meaning is a perfectly justifiable ground for going beyond the limits of direct experience. When, in addition, it turns out that the assumption of there being an unconscious enables us to construct a successful procedure by which we can exert an effective influence upon the course of conscious processes, this success will have given us an incontrovertible proof of the existence of what we have assumed. This being so, we must adopt the position that to require that whatever goes on in the mind must also be known to consciousness is to make an untenable claim.

We can go further and argue, in support of there being an unconscious psychical state, that at any given moment consciousness includes only a small content, so that the greater part of what we call conscious knowledge must in any case be for very considerable periods of time in a state of latency, that is to say, of being psychically unconscious. When all our latent memories are taken into consideration it becomes totally incomprehensible how the existence of the unconscious can be denied. But here we encounter the objection that these latent recollections can no longer be described as psychical, but that they correspond to residues of somatic processes from which what is psychical can once more arise. The obvious answer to this is that a latent memory is, on the contrary, an unquestionable residuum of a *psychical* process. But it is more important to realize clearly that this objection is based on the equation - not, it is true, explicitly stated but taken as axiomatic - of what is conscious with what is mental. This equation is either a *petitio principii* which begs the question whether everything that in psychical is also necessarily conscious; or else it is a matter of convention, of nomenclature. In this latter case it is, of course, like any other convention, not open to refutation. The question remains, however, whether the convention is so expedient that we are bound to adopt it. To this we may reply that the conventional equation of the psychical with the conscious is totally inexpedient. It disrupts psychical continuities, plunges us into the insoluble difficulties of psycho-physical parallelism, is open to the reproach that for no obvious reason it over-estimates the part played by consciousness, and that it forces us prematurely to abandon the field of psychological research without being able to offer us any compensation from other fields.

It is clear in any case that this question - whether the latent states of mental life, whose existence is undeniable, are to be conceived of as conscious mental states or as physical ones - threatens to resolve itself into a verbal dispute. We shall therefore be better advised to focus our attention on what we know with certainty of the nature of these debatable states. As far as their physical characteristics are concerned, they are totally inaccessible to us: no physiological concept or chemical process can give us any notion of their nature. On the other hand, we know for certain that they have abundant points of contact with conscious mental processes; with the help of a certain amount of work they can be transformed into, or replaced by, conscious mental processes, and all the categories which we employ to describe conscious mental acts, such as ideas, purposes, resolutions and so on, can be applied to them. Indeed, we are obliged to say of some of these latent states that the only respect in which they differ from conscious ones is precisely in the absence of consciousness. Thus we shall not hesitate to treat them as objects of psychological research, and to deal with them in the most intimate connection with conscious mental acts.

The stubborn denial of a psychical character to latent mental acts is accounted for by the circumstance that most of the phenomena concerned have not been the subject of study outside psycho-analysis. Anyone who is ignorant of pathological facts, who regards the parapraxes of normal people as accidental, and who is content with the old saw that dreams are froth [*Träume sind Schäume*] has only to ignore a few more problems of the psychology of consciousness in order to spare himself any need to assume an unconscious mental activity. Incidentally, even before the time of psycho-analysis, hypnotic experiments, and especially post-hypnotic suggestion, had tangibly demonstrated the existence and mode of operation of the mental unconscious.

The assumption of an unconscious is, moreover, a perfectly *legitimate* one, inasmuch as in postulating it we are not departing a single step from our customary and generally accepted mode of thinking. Consciousness makes each of us aware only of his own states of mind; that other people, too, possess a consciousness is an inference which we draw by analogy from their observable utterances and actions, in order to make this behaviour of theirs intelligible to us. (It would no doubt be psychologically more correct to put it in this way: that without any special reflection we attribute to everyone else our own constitution and therefore our consciousness as well, and that this identification is a *sine qua non* of our understanding.) This inference (or this identification) was formerly extended by the ego to other human beings, to animals, plants, inanimate objects and to the world at large, and proved serviceable so long as their similarity to the individual ego was overwhelmingly great; but it became more untrustworthy in proportion as the difference between the ego and these 'others' widened. To-day, our critical judgement is already in doubt on the question of consciousness in animals; we refuse to admit it in plants and we regard the assumption of its existence in inanimate matter as mysticism. But even where the original inclination to identification has withstood criticism - that is, when the 'others' are our fellow-men - the assumption of a consciousness in them rests upon an inference and cannot share the immediate certainty which we have of our own consciousness.

Psycho-analysis demands nothing more than that we should apply this process of inference to ourselves also - a proceeding to which, it is true, we are not constitutionally inclined. If we do this, we must say: all the acts and manifestations which I notice in myself and do not know how to link up with the rest of my mental life must be judged as if they belonged to someone else: they are to be explained by a mental life ascribed to this other person. Furthermore, experience shows that we understand very well how to interpret in other people (that is, how to fit into their chain of mental events) the same acts which we refuse to acknowledge as being mental in ourselves. Here some special hindrance evidently deflects our investigations from our own self and prevents our obtaining a true knowledge of it.

This process of inference, when applied to oneself in spite of internal opposition, does not, however, lead to the disclosure of an unconscious; it leads logically to the assumption of another, second consciousness which is united in one's self with the consciousness one knows. But at this point, certain criticisms may fairly be made. In the first place, a consciousness of which its own possessor knows nothing is something very different from a consciousness belonging to another person, and it is questionable whether such a consciousness, lacking, as it does, its most important characteristic, deserves any discussion at all. Those who have resisted the assumption of an unconscious *psychical* are not likely to be ready to exchange it for an unconscious *consciousness*. In the second place, analysis shows that the different latent mental processes inferred by us enjoy a high degree of mutual independence, as though they had no connection with one another, and knew nothing of one another. We must be prepared, if so, to assume the existence in us not only of a second consciousness, but of a third, fourth, perhaps of an unlimited number of states of consciousness, all unknown to us and to one another. In the third place - and this is the most weighty argument of all - we have to take into account the fact that analytic investigation reveals some of these latent processes as having characteristics and peculiarities which seem alien to us, or even incredible, and which run directly counter to the attributes of consciousness with which we are familiar. Thus we have grounds for modifying our inference about ourselves and saying that what is proved is not the existence of a second consciousness in us, but the existence of psychical acts which lack consciousness. We shall also be right in rejecting the term 'subconsciousness' as incorrect and misleading. The well-known cases of '*double conscience*'¹ (splitting of consciousness) prove nothing against our view. We may most aptly describe them as cases of a splitting of the mental activities into two groups, and say that the same consciousness turns to one or the other of these groups alternately.

¹ [The French term for 'dual consciousness'.]

In psycho-analysis there is no choice for us but to assert that mental processes are in themselves unconscious, and to liken the perception of them by means of consciousness to the perception of the external world by means of the sense-organs. We can even hope to gain fresh knowledge from the comparison. The psycho-analytic assumption of unconscious mental activity appears to us, on the one hand, as a further expansion of the primitive animism which caused us to see copies of our own consciousness all around us, and, on the other hand, as an extension of the corrections undertaken by Kant of our views on external perception. Just as Kant warned us not to overlook the fact that our perceptions are subjectively conditioned and must not be regarded as identical with what is perceived though unknowable, so psycho-analysis warns us not to equate perceptions by means of consciousness with the unconscious mental processes which are their object. Like the physical, the psychical is not necessarily in reality what it appears to us to be. We shall be glad to learn, however, that the correction of internal perception will turn out not to offer such great difficulties as the correction of external perception - that internal objects are less unknowable than the external world.

II. VARIOUS MEANINGS OF 'THE UNCONSCIOUS' - THE TOPOGRAPHICAL POINT OF VIEW

Before going any further, let us state the important, though inconvenient, fact that the attribute of being unconscious is only one feature that is found in the psychical and is by no means sufficient fully to characterize it. There are psychical acts of very varying value which yet agree in possessing the characteristic of being unconscious. The unconscious comprises, on the one hand, acts which are merely latent, temporarily unconscious, but which differ in no other respect from conscious ones and, on the other hand, processes such as repressed ones, which if they were to become conscious would be bound to stand out in the crudest contrast to the rest of the conscious processes. It would put an end to all misunderstandings if, from now on, in describing the various kinds of psychical acts we were to disregard the question of whether they were conscious or unconscious, and were to classify and correlate them only according to their relation to instincts and aims, according to their composition and according to which of the hierarchy of psychical systems they belong to. This, however, is for various reasons impracticable, so that we cannot escape the ambiguity of using the words 'conscious' and 'unconscious' sometimes in a descriptive and sometimes in a systematic sense, in which latter they signify inclusion in particular systems and possession of certain characteristics. We might attempt to avoid confusion by giving the psychical systems which we have distinguished certain arbitrarily chosen names which have no reference to the attribute of being conscious. Only we should first have to specify what the grounds are on which we distinguish the systems, and in doing this we should not be able to evade the attribute of being conscious, seeing that it forms the point of departure for all our investigations. Perhaps we may look for some assistance from the proposal to employ, at any rate in writing, the abbreviation *Cs.* for consciousness and *Ucs.* for what is unconscious, when we are using the two words in the systematic sense.

Proceeding now to an account of the positive findings of psycho-analysis, we may say that in general a psychical act goes through two phases as regards its state, between which is interposed a kind of testing (censorship). In the first phase the psychical act is unconscious and belongs to the system *Ucs.*; if, on testing, it is rejected by the censorship, it is not allowed to pass into the second phase; it is then said to be 'repressed' and must remain unconscious. If, however, it passes this testing, it enters the second phase and thenceforth belongs to the second system, which we will call the system *Cs.* But the fact that it belongs to that system does not yet unequivocally determine its relation to consciousness. It is not yet conscious, but it is certainly *capable of becoming conscious* (to use Breuer's expression) - that is, it can now, given certain conditions, become an object of consciousness without any special resistance. In consideration of this capacity for becoming conscious we also call the system *Cs.* the 'preconscious'. If it should turn out that a certain censorship also plays a part in determining whether the preconscious becomes conscious, we shall discriminate more sharply between the systems *Pcs.* and *Cs.* For the present let it suffice us to bear in mind that the system *Pcs.* shares the characteristics of the system *Cs.* and that the rigorous censorship exercises its office at the point of transition from the *Ucs.* to the *Pcs.* (or *Cs.*).

By accepting the existence of these two (or three) psychical systems, psycho-analysis has departed a step further from the descriptive 'psychology of consciousness' and has raised new problems and acquired a new content. Up till now, it has differed from that psychology mainly by reason of its *dynamic* view of mental processes; now in addition it seems to take account of psychical *topography* as well, and to indicate in respect of any given mental act within what system or between what systems it takes place. On account of this attempt, too, it has been given the name of 'depth-psychology'. We shall hear that it can be further enriched by taking yet another point of view into account.

If we are to take the topography of mental acts seriously we must direct our interest to a doubt which arises at this point. When a psychical act (let us confine ourselves here to one which is in the nature of an idea) is transposed from the system *Ucs.* into the system *Cs.* (or *Pcs.*), are we to suppose that this transposition involves a fresh record - as it were, a second registration - of the idea in question, which may thus be situated as well in a fresh psychical locality, and alongside of which the original unconscious registration continues to exist? Or are we rather to believe that the transposition consists in a change in the state of the idea, a change involving the same material and occurring in the same locality? This question may appear abstruse, but it must be raised if we wish to form a more definite conception of psychical topography, of the dimension of depth in the mind. It is a difficult one because it goes beyond pure psychology and touches on the relations of the mental apparatus to anatomy. We know that in the very roughest sense such relations exist. Research has given irrefutable proof that mental activity is bound up with the function of the brain as it is with no other organ. We are taken a step further - we do not know how much - by the discovery of the unequal importance of the different parts of the brain and their special relations to particular parts of the body and to particular mental activities. But every attempt to go on from there to discover a localization of mental processes, every endeavour to think of ideas as stored up in nerve-cells and of excitations as travelling along nerve-fibres, has miscarried completely. The same fate would await any theory which attempted to recognize, let us say, the anatomical position of the system *Cs.* - conscious mental activity - as being in the cortex, and to localize the unconscious processes in the sub-cortical parts of the brain. There is a hiatus here which at present cannot be filled, nor is it one of the tasks of psychology to fill it. Our psychical topography has *for the present* nothing to do with anatomy; it has reference not to anatomical localities, but to regions in the mental apparatus, wherever they may be situated in the body.

In this respect, then, our work is untrammelled and may proceed according to its own requirements. It will, however, be useful to remind ourselves that as things stand our hypotheses set out to be no more than graphic illustrations. The first of the two possibilities which we considered - namely, that the Cs. phase of an idea implies a fresh registration of it, which is situated in another place - is doubtless the cruder but also the more convenient. The second hypothesis - that of a merely *functional* change of state - is *a priori* more probable, but it is less plastic, less easy to manipulate. With the first, or topographical, hypothesis is bound up that of a topographical separation of the systems *Ucs.* and *Cs.* and also the possibility that an idea may exist simultaneously in two places in the mental apparatus indeed, that if it is not inhibited by the censorship, it regularly advances from the one position to the other, possibly without losing its first location or registration.

This view may seem odd, but it can be supported by observations from psycho-analytic practice. If we communicate to a patient some idea which he has at one time repressed but which we have discovered in him, our telling him makes at first no change in his mental condition. Above all, it does not remove the repression nor undo its effects, as might perhaps be expected from the fact that the previously unconscious idea has now become conscious. On the contrary, all that we shall achieve at first will be a fresh rejection of the repressed idea. But now the patient has in actual fact the same idea in two forms indifferent places in his mental apparatus: first, he has the conscious memory of the auditory trace of the idea, conveyed in what we told him; and secondly, he also has - as we know for certain - the unconscious memory of his experience as it was in its earlier form. Actually there is no lifting of the repression until the conscious idea, after the resistances have been overcome, has entered into connection with the unconscious memory-trace. It is only through the making conscious of the latter itself that success is achieved. On superficial consideration this would seem to show that conscious and unconscious ideas are distinct registrations, topographically separated, of the same content. But a moment's reflection shows that the identity of the information given to the patient with his repressed memory is only apparent. To have heard something and to have experienced something are in their psychological nature two quite different things, even though the content of both is the same.

So for the moment we are not in a position to decide between the two possibilities that we have discussed. Perhaps later on we shall come upon factors which may turn the balance in favour of one or the other. Perhaps we shall make the discovery that our question was inadequately framed and that the difference between an unconscious and a conscious idea has to be defined in quite another way.

III. UNCONSCIOUS EMOTIONS

We have limited the foregoing discussion to ideas; we may now raise a new question, the answer to which is bound to contribute to the elucidation of our theoretical views. We have said that there are conscious and unconscious ideas; but are there also unconscious instinctual impulses, emotions and feelings, or is it in this instance meaningless to form combinations of the kind?

I am in fact of the opinion that the antithesis of conscious and unconscious is not applicable to instincts. An instinct can never become an object of consciousness - only the idea that represents the instinct can. Even in the unconscious, moreover, an instinct cannot be represented otherwise than by an idea. If the instinct did not attach itself to an idea or manifest itself as an affective state, we could know nothing about it. When we nevertheless speak of an unconscious instinctual impulse or of a repressed instinctual impulse, the looseness of phraseology is a harmless one. We can only mean an instinctual impulse the ideational representative of which is unconscious, for nothing else comes into consideration.

We should expect the answer to the question about unconscious feelings, emotions and affects to be just as easily given. It is surely of the essence of an emotion that we should be aware of it, i.e. that it should become known to consciousness. Thus the possibility of the attribute of unconsciousness would be completely excluded as far as emotions, feelings and affects are concerned. But in psycho-analytic practice we are accustomed to speak of unconscious love, hate, anger, etc., and find it impossible to avoid even the strange conjunction 'unconscious consciousness of guilt', or a paradoxical 'unconscious anxiety'. Is there more meaning in the use of these terms than there is in speaking of 'unconscious instincts'?

The two cases are in fact not on all fours. In the first place, it may happen that an affective or emotional impulse is perceived but misconstrued. Owing to the repression of its proper representative it has been forced to become connected with another idea, and is now regarded by consciousness as the manifestation of that idea. If we restore the true connection, we call the original affective impulse an 'unconscious' one. Yet its affect was never unconscious; all that had happened was that its *idea* had undergone repression. In general, the use of the terms 'unconscious affect' and 'unconscious emotion' has reference to the vicissitudes undergone, in consequence of repression, by the quantitative factor in the instinctual impulse. We know that three such vicissitudes are possible:¹ either the affect remains, wholly or in part, as it is; or it is transformed into a qualitatively different quota of affect, above all into anxiety; or it is suppressed, i.e. it is prevented from developing at all. (These possibilities may perhaps be studied even more easily in the dream-work than in neuroses.) We know, too, that to suppress the development of affect is the true aim of repression and that its work is incomplete if this aim is not achieved. In every instance where repression has succeeded in inhibiting the development of affects, we term those affects (which we restore when we undo the work of repression) 'unconscious'. Thus it cannot be denied that the use of the terms in question is consistent; but in comparison with unconscious ideas there is the important difference that unconscious ideas continue to exist after repression as actual structures in the system *Ucs.*, whereas all that corresponds in that system to unconscious affects is a potential beginning which is prevented from developing. Strictly speaking, then, and although no fault can be found with the linguistic usage, there are no unconscious affects as there are unconscious ideas. But there may very well be in the system *Ucs.* affective structures which, like others, become conscious. The whole difference arises from the fact that ideas are cathexes - basically of memory-traces - whilst affects and feelings correspond to processes of discharge, the final manifestations of which are perceived as feelings. In the present state of our knowledge of affects and feelings we cannot express this difference more clearly.

¹ Cf. the preceding paper on 'Repression'.

It is of especial interest to us to have established the fact that repression can succeed in inhibiting an instinctual impulse from being turned into a manifestation of affect. This shows us that the system *Cs.* normally controls affectivity as well as access to motility; and it enhances the importance of repression, since it shows that repression results not only in withholding things from consciousness, but also in preventing the development of affect and the setting-off of muscular activity. Conversely, too, we may say that as long as the system *Cs.* controls affectivity and motility, the mental condition of the person in question is spoken of as normal. Nevertheless, there is an unmistakable difference in the relation of the controlling system to the two contiguous processes of discharge.¹ Whereas the control by the *Cs.* over voluntary motility is firmly rooted, regularly withstands the onslaught of neurosis and only breaks down in psychosis, control by the *Cs.* over the development of affects is less secure. Even within the limits of normal life we can recognize that a constant struggle for primacy over affectivity goes on between the two systems *Cs.* and *Ucs.*, that certain spheres of influence are marked off from one another and that intermixtures between the operative forces occur.

The importance of the system *Cs.* (*Pcs.*) as regards access to the release of affect and to action enables us also to understand the part played by substitutive ideas in determining the form taken by illness. It is possible for the development of affect to proceed directly from the system *Ucs.*; in that case the affect always has the character of anxiety, for which all 'repressed' affects are exchanged. Often, however, the instinctual impulse has to wait until it has found a substitutive idea in the system *Cs.* The development of affect can then proceed from this conscious substitute, and the nature of that substitute determines the qualitative character of the affect. We have asserted that in repression a severance takes place between the affect and the idea to which it belongs, and that each then undergoes its separate vicissitudes. Descriptively, this is incontrovertible; in actuality, however, the affect does not as a rule arise till the breakthrough to a new representation in the system *Cs.* has been successfully achieved.

¹ Affectivity manifests itself essentially in motor (secretory and vasomotor) discharge resulting in an (internal) alteration of the subject's own body without reference to the external world; motility, in actions designed to effect changes in the external world.

IV. TOPOGRAPHY AND DYNAMICS OF REPRESSION

We have arrived at the conclusion that repression is essentially a process affecting ideas on the border between the systems *Ucs.* and *Pcs.* (*Cs.*), and we can now make a fresh attempt to describe the process in greater detail.

It must be a matter of a *withdrawal* of cathexis; but the question is, in which system does the withdrawal take place and to which system does the cathexis that is withdrawn belong? The repressed idea remains capable of action in the *Ucs.*, and it must therefore have retained its cathexis. What has been withdrawn must be something else. Let us take the case of repression proper ('after-pressure'), as it affects an idea which is preconscious or even actually conscious. Here repression can only consist in withdrawing from the idea the (preconscious cathexis which belongs to the system *Pcs.* The idea then either remains uncathexed, or receives cathexis from the *Ucs.*, or retains the *Ucs.* cathexis which it already had. Thus there is a withdrawal of the preconscious cathexis, retention of the unconscious cathexis, or replacement of the preconscious cathexis by an unconscious one. We notice, moreover, that we have based these reflections (as it were, without meaning to) on the assumption that the transition from the system *Ucs.* to the system next to it is not effected through the making of a new registration but through a change in its state, an alteration in its cathexis. The functional hypothesis has here easily defeated the topographical one.

But this process of withdrawal of libido is not adequate to make another characteristic of repression comprehensible to us. It is not clear why the idea which has remained cathexed or has received cathexis from the *Ucs.* should not, in virtue of its cathexis, renew the attempt to penetrate into the system *Pcs.* If it could do so, the withdrawal of libido from it would have to be repeated, and the same performance would go on endlessly; but the outcome would not be repression. So, too, when it comes to describing *primal* repression, the mechanism just discussed of withdrawal of preconscious cathexis would fail to meet the case; for here we are dealing with an unconscious idea which has as yet received *no* cathexis from the *Pcs.* and therefore cannot have that cathexis withdrawn from it.

What we require, therefore, is another process which maintains the repression in the first case and, in the second, ensures its being established as well as continued. This other process can only be found in the assumption of an *anticathexis*, by means of which the system *Pcs.* protects itself from the pressure upon it of the unconscious idea. We shall see from clinical examples how such an anticathexis, operating in the system *Pcs.*, manifests itself. It is this which represents the permanent expenditure of a primal repression, and which also guarantees the permanence of that repression. Anticathexis is the sole mechanism of primal repression; in the case of repression proper ('after-pressure') there is in addition withdrawal of the *Pcs.* cathexis. It is very possible that it is precisely the cathexis which is withdrawn from the idea that is used for anticathexis.

We see how we have gradually been led into adopting a third point of view in our account of psychical phenomena. Besides the dynamic and the topographical points of view, we have adopted the *economic* one. This endeavours to follow out the vicissitudes of amounts of excitation and to arrive at least at some *relative* estimate of their magnitude.

It will not be unreasonable to give a special name to this whole way of regarding our subject-matter, for it is the consummation of psycho-analytic research. I propose that when we have succeeded in describing a psychical process in its dynamic, topographical and economic aspects, we should speak of it as a *metapsychological* presentation. We must say at once that in the present state of our knowledge there are only a few points at which we shall succeed in this.

Let us make a tentative effort to give a metapsychological description of the process of repression in the three transference neuroses which are familiar to us. Here we may replace 'cathexis' by 'libido', because, as we know, it is the vicissitudes of *sexual* impulses with which we shall be dealing.

In anxiety hysteria a first phase of the process is frequently overlooked, and may perhaps be in fact missed out; on careful observation, however, it can be clearly discerned. It consists in anxiety appearing without the subject knowing what he is afraid of. We must suppose that there was present in the *Ucs.* some love-impulse demanding to be transposed into the system *Pcs.*; but the cathexis directed to it from the latter system has drawn back from the impulse (as though in an attempt at flight) and the unconscious libidinal cathexis of the rejected idea has been discharged in the form of anxiety.

On the occasion of a repetition (if there should be one) of this process, a first step is taken in the direction of mastering the unwelcome development of anxiety. The cathexis that has taken flight attaches itself to a substitutive idea which, on the one hand, is connected by association with the rejected idea, and, on the other, has escaped repression by reason of its remoteness from that idea. This substitutive idea - a 'substitute by displacement' - permits the still uninhabitable development of anxiety to be rationalized. It now plays the part of an anticathexis for the system *Cs.* (*Pcs.*), by securing it against an emergence in the *Cs.* of the repressed idea. On the other hand it is, or acts as if it were, the point of departure for the release of the anxiety-affect, which has now really become quite uninhabitable. Clinical observation shows, for instance, that a child suffering from an animal phobia experiences anxiety under two kinds of conditions: in the first place, when his repressed love-impulse becomes intensified, and, in the second, when he perceives the animal he is afraid of. The substitutive idea acts in the one instance as a point at which there is a passage across from the system *Ucs.* to the system *Cs.*, and, in the other instance, as a self-sufficing source for the release of anxiety. The extending dominance of the system *Cs.* usually manifests itself in the fact that the first of these two modes of excitation of the substitutive idea gives place more and more to the second. The child may perhaps end by behaving as though he had no predilection whatever towards his father but had become quite free from him, and as though his fear of the animal was a real fear - except that this fear of the animal, fed as such a fear is from an unconscious instinctual source, proves obdurate and exaggerated in the face of all influences brought to bear from the system *Cs.*, and thereby betrays its derivation from the system *Ucs.* - In the second phase of anxiety hysteria, therefore, the anticathexis from the system *Cs.* has led to substitute-formation.

Soon the same mechanism finds a fresh application. The process of repression, as we know, is not yet completed, and it finds a further aim in the task of inhibiting the development of the anxiety which arises from the substitute. This is achieved by the whole of the associated environment of the substitutive idea being cathected with special intensity, so that it can display a high degree of sensibility to excitation. Excitation of any point in this outer structure must inevitably, on account of its connection with the substitutive idea, give rise to a slight development of anxiety; and this is now used as a signal to inhibit, by means of a fresh flight on the part of the cathexis, the further progress of the development of anxiety. The further away the sensitive and vigilant anticathexes are situated from the feared substitute, the more precisely can the mechanism function which is designed to isolate the substitutive idea and to protect it from fresh excitations. These precautions naturally only guard against excitations which approach the substitutive idea from outside, through perception; they never guard against instinctual excitation, which reaches the substitutive idea from the direction of its link with the repressed idea. Thus the precautions do not begin to operate till the substitute has satisfactorily taken over representation of the repressed, and they can never operate with complete reliability. With each increase of instinctual excitation the protecting rampart round the substitutive idea must be shifted a little further outwards. The whole construction, which is set up in an analogous way in the other neuroses, is termed a *phobia*. The flight from a conscious cathexis of the substitutive idea is manifested in the avoidances, renunciations and prohibitions by which we recognize anxiety hysteria.

Surveying the whole process, we may say that the third phase repeats the work of the second on an ampler scale. The system Cs. now protects itself against the activation of the substitutive idea by an anticathexis of its environment, just as previously it had secured itself against the emergence of the repressed idea by a cathexis of the substitutive idea. In this way the formation of substitutes by displacement has been further continued. We must also add that the system Cs. had earlier only one small area at which the repressed instinctual impulse could break through, namely, the substitutive idea; but that ultimately this *enclave* of unconscious influence extends to the whole phobic outer structure. Further, we may lay stress on the interesting consideration that by means of the whole defensive mechanism thus set in action a projection outward of the instinctual danger has been achieved. The ego behaves as if the danger of a development of anxiety threatened it not from the direction of an instinctual impulse but from the direction of a perception, and it is thus enabled to react against this external danger with the attempts at flight represented by phobic avoidances. In this process repression is successful in one particular: the release of anxiety can to some extent be dammed up, but only at a heavy sacrifice of personal freedom. Attempts at flight from the demands of instinct are, however, in general useless, and, in spite of everything, the result of phobic flight remains unsatisfactory.

A great deal of what we have found in anxiety hysteria also holds good for the other two neuroses, so that we can confine our discussion to their points of difference and to the part played by anticathexis. In conversion hysteria the instinctual cathexis of the repressed idea is changed into the innervation of the symptom. How far and in what circumstances the unconscious idea is drained empty by this discharge into innervation, so that it can relinquish its pressure upon the system Cs. - these and similar questions had better be reserved for a special investigation of hysteria. In conversion hysteria the part played by the anticathexis proceeding from the system Cs. (*Pcs.*) is clear and becomes manifest in the formation of the symptom. It is the anticathexis that decides upon what portion of the instinctual representative the whole cathexis of the latter is able to be concentrated. The portion thus selected to be a symptom fulfils the condition of expressing the wishful aim of the instinctual impulse no less than the defensive or punitive efforts of the system Cs.; thus it becomes hypercathected, and it is maintained from both directions like the substitutive idea in anxiety hysteria. From this circumstance we may conclude without hesitation that the amount of energy expended by the system Cs. on repression need not be so great as the cathectic energy of the symptom; for the strength of the repression is measured by the amount of anticathexis expended, whereas the symptom is supported not only by this anticathexis but also by the instinctual cathexis from the system *Ucs.* which is condensed in the symptom.

As regards obsessional neurosis, we need only add to the observations brought forward in the preceding paper that it is here that the anticathexis from the system Cs. comes most noticeably into the foreground. It is this which, organized as a reaction-formation, brings about the first repression, and which is later the point at which the repressed idea breaks through. We may venture the supposition that it is because of the predominance of the anticathexis and the absence of discharge that the work of repression seems far less successful in anxiety hysteria and in obsessional neurosis than in conversion hysteria.

V. THE SPECIAL CHARACTERISTICS OF THE SYSTEM *Ucs.*

The distinction we have made between the two psychical systems receives fresh significance when we observe that processes in the one system, the *Ucs.*, show characteristics which are not met with again in the system immediately above it.

The nucleus of the *Ucs.* consists of instinctual representatives which seek to discharge their cathexis; that is to say, it consists of wishful impulses. These instinctual impulses are co-ordinate with one another, exist side by side without being influenced by one another, and are exempt from mutual contradiction. When two wishful impulses whose aims must appear to us incompatible become simultaneously active, the two impulses do not diminish each other or cancel each other out, but combine to form an intermediate aim, a compromise.

There are in this system no negation, no doubt, no degrees of certainty: all this is only introduced by the work of the censorship between the *Ucs.* and the *Pcs.* Negation is a substitute, at a higher level, for repression. In the *Ucs.* there are only contents, cathected with greater or lesser strength.

The cathectic intensities are much more mobile. By the process of *displacement* one idea may surrender to another its whole quota of cathexis; by the process of *condensation* it may appropriate the whole cathexis of several other ideas. I have proposed to regard these two processes as distinguishing marks of the so-called *primary psychical process*. In the system *Pcs.* the *secondary process*¹ is dominant. When a primary process is allowed to take its course in connection with elements belonging to the system *Pcs.*, it appears 'comic' and excites laughter.

¹ Cf. the discussion in Chapter VII of *The Interpretation of Dreams* (1900a), based on ideas developed by Breuer in *Studies on Hysteria* (Breuer and Freud, 1895).

The processes of the system *Ucs.* are *timeless*; i.e. they are not ordered temporally, are not altered by the passage of time; they have no reference to time at all. Reference to time is bound up, once again, with the work of the system *Cs.*

The *Ucs.* processes pay just as little regard to *reality*. They are subject to the pleasure principle; their fate depends only on how strong they are and on whether they fulfil the demands of the pleasure-unpleasure regulation.

To sum up: *exemption from mutual contradiction, primary process* (mobility of cathexes), *timelessness*, and *replacement of external by psychical reality* - these are the characteristics which we may expect to find in processes belonging to the system *Ucs.*¹

Unconscious processes only become cognizable by us under the conditions of dreaming and of neurosis - that is to say, when processes of the higher, *Pcs.*, system are set back to an earlier stage by being lowered (by regression). In themselves they cannot be cognized, indeed are even incapable of carrying on their existence; for the system *Ucs.* is at a very early moment overlaid by the *Pcs.* which has taken over access to consciousness and to motility. Discharge from the system *Ucs.* passes into somatic innervation that leads to development of affect; but even this path of discharge is, as we have seen, contested by the *Pcs.* By itself, the system *Ucs.* would not in normal conditions be able to bring about any expedient muscular acts, with the exception of those already organized as reflexes.

¹ We are reserving for a different context the mention of another notable privilege of the *Ucs.*

The full significance of the characteristics of the system *Ucs.* described above could only be appreciated by us if we were to contrast and compare them with those of the system *Pcs.* But this would take us so far afield that I propose that we should once more call a halt and not undertake the comparison of the two till we can do so in connection with our discussion of the higher system. Only the most pressing points of all will be mentioned at this stage.

The processes of the system *Pcs.* display - no matter whether they are already conscious or only capable of becoming conscious - an inhibition of the tendency of cathected ideas towards discharge. When a process passes from one idea to another, the first idea retains a part of its cathexis and only a small portion undergoes displacement. Displacements and condensations such as happen in the primary process are excluded or very much restricted. This circumstance caused Breuer to assume the existence of two different states of cathectic energy in mental life: one in which the energy is tonically 'bound' and the other in which it is freely mobile and presses towards discharge. In my opinion this distinction represents the deepest insight we have gained up to the present into the nature of nervous energy, and I do not see how we can avoid making it. A metapsychological presentation would most urgently call for further discussion at this point, though perhaps that would be too daring an undertaking as yet.

Further, it devolves upon the system *Pcs.* to make communication possible between the different ideational contents so that they can influence one another, to give them an order in time, and to set up a censorship or several censorships; 'reality testing' too, and the reality-principle, are in its province. Conscious memory, moreover, seems to depend wholly on the *Pcs.* This should be clearly distinguished from the memory-traces in which the experiences of the *Ucs.* are fixed, and probably corresponds to a special registration such as we proposed (but later rejected) to account for the relation of conscious to unconscious ideas. In this connection, also, we shall find means for putting an end to our oscillations in regard to the naming of the higher system - which we have hitherto spoken of indifferently, sometimes as the *Pcs.* and sometimes as the *Cs.*

Nor will it be out of place here to utter a warning against any over-hasty generalization of what we have brought to light concerning the distribution of the various mental functions between the two systems. We are describing the state of affairs as it appears in the adult human being, in whom the system *Ucs.* operates, strictly speaking, only as a preliminary stage of the higher organization. The question of what the content and connections of that system are during the development of the individual, and of what significance it possesses in animals - these are points on which no conclusion can be deduced from our description: they must be investigated independently. Moreover, in human beings we must be prepared to find possible pathological conditions under which the two systems alter, or even exchange, both their content and their characteristics.

VI. COMMUNICATION BETWEEN THE TWO SYSTEMS

It would nevertheless be wrong to imagine that the *Ucs.* remains at rest while the whole work of the mind is performed by the *Pcs.* - that the *Ucs.* is something finished with, a vestigial organ, a residuum from the process of development. It is wrong also to suppose that communication between the two systems is confined to the act of repression, with the *Pcs.* casting everything that seems disturbing to it into the abyss of the *Ucs.* On the contrary, the *Ucs.* is alive and capable of development and maintains a number of other relations with the *Pcs.*, amongst them that of co-operation. In brief, it must be said that the *Ucs.* is continued into what are known as derivatives, that it is accessible to the impressions of life, that it constantly influences the *Pcs.*, and is even, for its part, subjected to influences from the *Pcs.*

Study of the derivatives of the *Ucs.* will completely disappoint our expectations of a schematically clear-cut distinction between the two psychical systems. This will no doubt give rise to dissatisfaction with our results and will probably be used to cast doubts on the value of the way in which we have divided up the psychical processes. Our answer is, however, that we have no other aim but that of translating into theory the results of observation, and we deny that there is any obligation on us to achieve at our first attempt a well-rounded theory which will commend itself by its simplicity. We shall defend the complications of our theory so long as we find that they meet the results of observation, and we shall not abandon our expectations of being led in the end by those very complications to the discovery of a state of affairs which, while simple in itself, can account for all the complications of reality.

Among the derivatives of the *Ucs.* instinctual impulses, of the sort we have described, there are some which unite in themselves characters of an opposite kind. On the one hand, they are highly organized, free from self-contradiction, have made use of every acquisition of the system *Cs.* and would hardly be distinguished in our judgement from the formations of that system. On the other hand they are unconscious and are incapable of becoming conscious. Thus *qualitatively* they belong to the system *Pcs.*, but *factually* to the *Ucs.* Their origin is what decides their fate. We may compare them with individuals of mixed race who, taken all round, resemble white men, but who betray their coloured descent by some striking feature or other, and on that account are excluded from society and enjoy none of the privileges of white people. Of such a nature are those phantasies of normal people as well as of neurotics which we have recognized as preliminary stages in the formation both of dreams and of symptoms and which, in spite of their high degree of organization, remain repressed and therefore cannot become conscious. They draw near to consciousness and remain undisturbed so long as they do not have an intense cathexis, but as soon as they exceed a certain height of cathexis they are thrust back. Substitutive formations, too, are highly organized derivatives of the *Ucs.* of this kind; but these succeed in breaking through into consciousness, when circumstances are favourable - for example, if they happen to join forces with an anticathexis from the *Pcs.*

When, elsewhere, we come to examine more closely the preconditions for becoming conscious, we shall be able to find a solution of some of the difficulties that arise at this juncture. Here it seems a good plan to look at things from the angle of consciousness, in contrast to our previous approach, which was upwards from the *Ucs.* To consciousness the whole sum of psychical processes presents itself as the realm of the preconscious. A very great part of this preconscious originates in the unconscious, has the character of its derivatives and is subjected to a censorship before it can become conscious. Another part of the *Pcs.* is capable of becoming conscious without any censorship. Here we come upon a contradiction of an earlier assumption. In discussing the subject of repression we were obliged to place the censorship which is decisive for becoming conscious between the systems *Ucs.* and *Pcs.*. Now it becomes probable that there is a censorship between the *Pcs.* and the *Cs.* Nevertheless we shall do well not to regard this complication as a difficulty, but to assume that to every transition from one system to that immediately above it (that is, every advance to a higher stage of psychical organization) there corresponds a new censorship. This, it may be remarked, does away with the assumption of a continuous laying down of new registrations.

The reason for all these difficulties is to be found in the circumstance that the attribute of being conscious, which is the only characteristic of psychical processes that is directly presented to us, is in no way suited to serve as a criterion for the differentiation of systems. Apart from the fact that the conscious is not always conscious but also at times latent, observation has shown that much that shares the characteristics of the system *Pcs.* does not become conscious; and we learn in addition that the act of becoming conscious is dependent on the attention of the *Pcs.* being turned in certain directions. Hence consciousness stands in no simple relation either to the different systems or to repression. The truth is that it is not only the psychically repressed that remains alien to consciousness, but also some of the impulses which dominate our ego - something, therefore, that forms the strongest functional antithesis to the repressed. The more we seek to win our way to a metapsychological view of mental life, the more we must learn to emancipate ourselves from the importance of the symptom of 'being conscious'.

So long as we still cling to this belief we see our generalizations regularly broken through by exceptions. On the one hand we find that derivatives of the *Ucs.* become conscious as substitutive formations and symptoms - generally, it is true, after having undergone great distortion as compared with the unconscious, though often retaining many characteristics which call for repression. On the other hand, we find that many preconscious formations remain unconscious, though we should have expected that, from their nature, they might very well have become conscious. Probably in the latter case the stronger attraction of the *Ucs.* is asserting itself. We are led to look for the more important distinction as lying, not between the conscious and the preconscious, but between the preconscious and the unconscious. The *Ucs.* is turned back on the frontier of the *Pcs.* by the censorship, but derivatives of the *Ucs.* can circumvent this censorship, achieve a high degree of organization and reach a certain intensity of cathexis in the *Pcs.* When, however, this intensity is exceeded and they try to force themselves into consciousness, they are recognized as derivatives of the *Ucs.* and are repressed afresh at the new frontier of censorship, between the *Pcs.* and the *Cs.* Thus the first of these censorships is exercised against the *Ucs.* itself, and the second against its *Pcs.* derivatives. One might suppose that in the course of individual development the censorship had taken a step forward.

In psycho-analytic treatment the existence of the second censorship, located between the systems *Pcs.* and *Cs.*, is proved beyond question. We require the patient to form numerous derivatives of the *Ucs.*, we make him pledge himself to overcome the objections of the censorship to these preconscious formations becoming conscious, and by overthrowing *this* censorship, we open up the way to abrogating the repression accomplished by the *earlier* one. To this let us add that the existence of the censorship between the *Pcs.* and the *Cs.* teaches us that becoming conscious is no mere act of perception, but is probably also a *hypercathexis*, a further advance in the psychical organization.

Let us turn to the communications between the *Ucs.* and the other systems, less in order to establish anything new than in order to avoid omitting what is most prominent. At the roots of instinctual activity the systems communicate with one another most extensively. One portion of the processes which are there excited passes through the *Ucs.*, as through a preparatory stage, and reaches the highest psychical development in the *Cs.*; another portion is retained as *Ucs.* But the *Ucs.* is also affected by experiences originating from external perception. Normally all the paths from perception to the *Ucs.* remain open, and only those leading on from the *Ucs.* are subject to blocking by repression.

It is a very remarkable thing that the *Ucs.* of one human being can react upon that of another, without passing through the *Cs.* This deserves closer investigation, especially with a view to finding out whether preconscious activity can be excluded as playing a part in it; but, descriptively speaking, the fact is incontestable.

The content of the system *Pcs.* (or *Cs.*) is derived partly from instinctual life (through the medium of the *Ucs.*), and partly from perception. It is doubtful how far the processes of this system can exert a direct influence on the *Ucs.*; examination of pathological cases often reveals an almost incredible independence and lack of susceptibility to influence on the part of the *Ucs.* A complete divergence of their trends, a total severance of the two systems, is what above all characterizes a condition of illness. Nevertheless, psycho-analytic treatment is based upon an influencing of the *Ucs.* from the direction of the *Cs.*, and at any rate shows that this, though a laborious task, is not impossible. The derivatives of the *Ucs.* which act as intermediaries between the two systems open the way, as we have already said, towards accomplishing this. But we may safely assume that a spontaneously effected alteration in the *Ucs.* from the direction of the *Cs.* is a difficult and slow process.

Co-operation between a preconscious and an unconscious impulse, even when the latter is intensely repressed, may come about if there is a situation in which the unconscious impulse can act in the same sense as one of the dominant trends. The repression is removed in this instance, and the repressed activity is admitted as a reinforcement of the one intended by the ego. The unconscious becomes ego-syntonic in respect of this single conjunction without any change taking place in its repression apart from this. In this co-operation the influence of the *Ucs.* is unmistakable: the reinforced tendencies reveal themselves as being nevertheless different from the normal; they make specially perfect functioning possible, and they manifest a resistance in the face of opposition which is similar to that offered, for instance, by obsessional symptoms.

The content of the *Ucs.* may be compared with an aboriginal population in the mind. If inherited mental formations exist in the human being - something analogous to instinct¹ in animals - these constitute the nucleus of the *Ucs.* Later there is added to them what is discarded during childhood development as unserviceable; and this need not differ in its nature from what is inherited. A sharp and final division between the content of the two systems does not, as a rule, take place till puberty.

¹ [The German word here is '*Instinkt*', not the usual '*Trieb*'.]

VII. ASSESSMENT OF THE UNCONSCIOUS

What we have put together in the preceding discussions is probably as much as we can say about the *Ucs.* so long as we only draw upon our knowledge of dream-life and the transference neuroses. It is certainly not much, and at some points it gives an impression of obscurity and confusion; and above all it offers us no possibility of co-ordinating or subsuming the *Ucs.* into any context with which we are already familiar. It is only the analysis of one of the affections which we call narcissistic psychoneuroses that promises to furnish us with conceptions through which the enigmatic *Ucs.* will be brought more within our reach and, as it were, made tangible.

Since the publication of a work by Abraham (1908) - which that conscientious author has attributed to my instigation - we have tried to base our characterization of Kraepelin's 'dementia praecox' (Bleuler's 'schizophrenia') on its position with reference to the antithesis between ego and object. In the transference neuroses (anxiety hysteria, conversion hysteria and obsessional neurosis) there was nothing to give special prominence to this antithesis. We knew, indeed, that frustration in regard to the object brings on the outbreak of the neurosis and that the neurosis involves a renunciation of the real object; we knew too that the libido that is withdrawn from the real object reverts first to a phantasied object and then to one that had been repressed (introversion). But in these disorders object-cathexis in general is retained with great energy, and more detailed examination of the process of repression has obliged us to assume that object-cathexis persists in the system *Ucs.* in spite of - or rather in consequence of - repression. Indeed, the capacity for transference, of which we make use for therapeutic purposes in these affections, presupposes an unimpaired object-cathexis.

In the case of schizophrenia, on the other hand, we have been driven to the assumption that after the process of repression the libido that has been withdrawn does not seek a new object, but retreats into the ego; that is to say, that here the object-cathexes are given up and a primitive objectless condition of narcissism is re-established. The incapacity of these patients for transference (so far as the pathological process extends), their consequent inaccessibility to therapeutic efforts, their characteristic repudiation of the external world, the appearance of signs of a hypercathexis of their own ego, the final outcome in complete apathy - all these clinical features seem to agree excellently with the assumption that their object-cathexes have been given up. As regards the relation of the two psychical systems to each other, all observers have been struck by the fact that in schizophrenia a great deal is expressed as being conscious which in the transference neuroses can only be shown to be present in the *Ucs.* by psycho-analysis. But to begin with we were not able to establish any intelligible connection between the ego-object relation and the relationships of consciousness.

What we are seeking seems to present itself in the following unexpected way. In schizophrenics we observe - especially in the initial stages, which are so instructive - a number of changes in *speech*, some of which deserve to be regarded from a particular point of view. The patient often devotes peculiar care to his way of expressing himself, which becomes 'stilted' and 'precious'. The construction of his sentences undergoes a peculiar disorganization, making them so incomprehensible to us that his remarks seem nonsensical. Some reference to bodily organs or innervations is often given prominence in the content of these remarks. To this may be added the fact that in such symptoms of schizophrenia as are comparable with the substitutive formations of hysteria or obsessional neurosis, the relation between the substitute and the repressed material nevertheless displays peculiarities which would surprise us in these two forms of neurosis.

Dr. Victor Tausk of Vienna has placed at my disposal some observations that he has made in the initial stages of schizophrenia in a female patient, which are particularly valuable in that the patient was ready to explain her utterances herself. I will take two of his examples to illustrate the view I wish to put forward, and I have no doubt that every observer could easily produce plenty of such material.

A patient of Tausk's, a girl who was brought to the clinic after a quarrel with her lover, complained that *her eyes were not right, they were twisted*. This she herself explained by bringing forward a series of reproaches against her lover in coherent language. 'She could not understand him at all, he looked different every time; he was a hypocrite, an eye-twister,¹ he had twisted her eyes; now she had twisted eyes; they were not her eyes any more; now she saw the world with different eyes.'

The patient's comments on her unintelligible remark have the value of an analysis, for they contain the equivalent of the remark expressed in a generally comprehensible form. They throw light at the same time on the meaning and the genesis of schizophrenic word-formation. I agree with Tausk in stressing in this example the point that the patient's relation to a bodily organ (the eye) has arrogated to itself the representation of the whole content. Here the schizophrenic utterance exhibits a hypochondriac trait: it has become '*organ-speech*'.

A second communication by the same patient was as follows: 'She was standing in church. Suddenly she felt a jerk; she had to *change her position, as though somebody was putting her into a position, as though she was being put in a certain position.*'

Now came the analysis of this through a fresh series of reproaches against her lover. 'He was common, he had made her common, too, though she was naturally refined. He had made her like himself by making her think that he was superior to her; now she had become like him, because she thought she would be better if she were like him. He had *given a false impression of his position*; now she was just like him' (by identification), 'he had *put her in a false position*'.

The physical movement of 'changing her position', Tausk remarks, depicted the words 'putting her in a false position' and her identification with her lover. I would call attention once more to the fact that the whole train of thought is dominated by the element which has for its content a bodily innervation (or, rather, the sensation of it). Furthermore, a hysterical woman would, in the first example, have *in fact* convulsively twisted her eyes, and, in the second, have given actual jerks, instead of having the *impulse* to do so or the *sensation* of doing so: and in neither example would she have any accompanying conscious thoughts, nor would she have been able to express any such thoughts afterwards.

¹ [The German '*Augenverdreher*' has the figurative meaning of 'deceiver'.]

These two observations, then, argue in favour of what we have called hypochondriacal speech or 'organ-speech'. But, what seems to us more important, they also point to something else, of which we have innumerable instances (for example, in the cases collected in Bleuler's monograph) and which may be reduced to a definite formula. In schizophrenia *words* are subjected to the same process as that which makes the dream images out of latent dream-thoughts - to what we have called the primary psychical process. They undergo condensation, and by means of displacement transfer their cathexes to one another in their entirety. The process may go so far that a single word, if it is specially suitable on account of its numerous connections, takes over the representation of a whole train of thought. The works of Bleuler, Jung and their pupils offer a quantity of material which particularly supports this assertion.¹

Before we draw any conclusion from impressions such as these, let us consider further the distinctions between the formation of substitutes in schizophrenia on the one hand, and in hysteria and obsessional neurosis on the other - subtle distinctions which nevertheless make a strange impression. A patient whom I have at present under observation has allowed himself to be withdrawn from all the interests of life on account of a bad condition of the skin of his face. He declares that he has black heads and deep holes in his face which everyone notices. Analysis shows that he is playing out his castration complex upon his skin. At first he worked at these blackheads remorselessly; and it gave him great satisfaction to squeeze them out, because, as he said, something spurted out when he did so. Then he began to think that a deep cavity appeared wherever he had got rid of a blackhead, and he reproached himself most vehemently with having ruined his skin for ever by 'constantly fiddling about with his hand'. Pressing out the content of the blackheads is clearly to him a substitute for masturbation. The cavity which then appears owing to his fault is the female genital, i.e. the fulfilment of the threat of castration (or the phantasy representing that threat) provoked by his masturbating. This substitutive formation has, in spite of its hypochondriacal character, considerable resemblance to a hysterical conversion; and yet we have a feeling that something different must be going on here, that a substitutive formation such as this cannot be attributed to hysteria, even before we can say in what the difference consists. A tiny little cavity such as a pore of the skin would hardly be used by a hysteric as a symbol for the vagina, which he is otherwise ready to compare with every imaginable object that encloses a hollow space. Besides, we should expect the multiplicity of these little cavities to prevent him from using them as a substitute for the female genital. The same applies to the case of a young patient reported by Tausk some years ago to the Vienna Psycho-Analytical Society. This patient behaved in other respects exactly as though he were suffering from an obsessional neurosis; he took hours to wash and dress, and so on. It was noticeable, however, that he was able to give the meaning of his inhibitions without any resistance. In putting on his stockings, for instance, he was disturbed by the idea that he must pull apart the stitches in the knitting, i.e. the holes, and to him every hole was a symbol of the female genital aperture. This again is a thing which we cannot attribute to an obsessional neurotic. Reitler observed a patient of the latter sort, who also suffered from having to take a long time over putting on his stockings; this man, after overcoming his resistances, found as the explanation that his foot symbolized a penis, that putting on the stocking stood for a masturbatory act, and that he had to keep on pulling the stocking on and off, partly in order to complete the picture of masturbation, and partly in order to undo that act.

¹ The dream-work, too, occasionally treats words like things, and so creates very similar 'schizophrenic' utterances or neologisms.

If we ask ourselves what it is that gives the character of strangeness to the substitutive formation and the symptom in schizophrenia, we eventually come to realize that it is the predominance of what has to do with words over what has to do with things. As far as the thing goes, there is only a very slight similarity between squeezing out a blackhead and an emission from the penis, and still less similarity between the innumerable shallow pores of the skin and the vagina; but in the former case there is, in both instances, a 'spurting out', while in the latter the cynical saying, 'a hole is a hole', is true verbally. What has dictated the substitution is not the resemblance between the things denoted but the sameness of the words used to express them. Where the two - word and thing - do not coincide, the formation of substitutes in schizophrenia deviates from that in the transference neuroses.

If now we put this finding alongside the hypothesis that in schizophrenia object-cathexes are given up, we shall be obliged to modify the hypothesis by adding that the cathexis of the *word*-presentations of objects is retained. What we have permissibly called the conscious presentation of the object can now be split up into the presentation of the *word* and the presentation of the *thing*; the latter consists in the cathexis, if not of the direct memory-images of the thing, at least of remoter memory-traces derived from these. We now seem to know all at once what the difference is between a conscious and an unconscious presentation. The two are not, as we supposed, different registrations of the same content in different psychical localities, nor yet different functional states of cathexis in the same locality; but the conscious presentation comprises the presentation of the thing plus the presentation of the word belonging to it, while the unconscious presentation is the presentation of the thing alone. The system *Ucs.* contains the thing-cathexes of the objects, the first and true object-cathexes; the system *Pcs.* comes about by this thing-presentation being hypercathected through being linked with the word-presentations corresponding to it. It is these hypercathexes, we may suppose, that bring about a higher psychical organization and make it possible for the primary process to be succeeded by the secondary process which is dominant in the *Pcs.* Now, too, we are in a position to state precisely what it is that repression denies to the rejected presentation in the transference neuroses: what it denies to the presentation is translation into words which shall remain attached to the object. A presentation which is not put into words, or a psychical act which is not hypercathected, remains thereafter in the *Ucs.* in a state of repression.

I should like to point out at what an early date we already possessed the insight which to-day enables us to understand one of the most striking characteristics of schizophrenia. In the last few pages of *The Interpretation of Dreams*, which was published in 1900, the view was developed that thought-processes, i.e. those acts of cathexis which are comparatively remote from perception, are in themselves without quality and unconscious, and that they attain their capacity to become conscious only through being linked with the residues of perceptions of *words*. But word-presentations, for their part too, are derived from sense-perceptions, in the same way as thing-presentations are; the question might therefore be raised why presentations of objects cannot become conscious through the medium of their *own* perceptual residues. Probably, however, thought proceeds in systems so far remote from the original perceptual residues that they have no longer retained anything of the qualities of those residues, and, in order to become conscious, need to be reinforced by new qualities. Moreover, by being linked with words, cathexes can be provided with quality even when they represent only *relations* between presentations of objects and are thus unable to derive any quality from perceptions. Such relations, which become comprehensible only through words, form a major part of our thought-processes. As we can see, being linked with word-presentations is not yet the same thing as becoming conscious, but only makes it possible to become so; it is therefore characteristic of the system *Pcs.* and of that system alone. With these discussions, however, we have evidently departed from our subject proper and find ourselves plunged into problems concerning the preconscious and the conscious, which for good reasons we are reserving for separate treatment.

As regards schizophrenia, which we only touch on here so far as seems indispensable for a general understanding of the *Ucs.*, a doubt must occur to us whether the process here termed repression has anything at all in common with the repression which takes place in the transference neuroses. The formula that repression is a process which occurs between the systems *Ucs.* and *Pcs.* (or *Cs.*), and results in keeping something at a distance from consciousness, must in any event be modified, in order that it may also be able to include the case of dementia praecox and other narcissistic affections. But the ego's attempt at flight, which expresses itself in the withdrawal of the conscious cathexis, nevertheless remains a factor common [to the two classes of neurosis]. The most superficial reflection shows us how much more radically and profoundly this attempt at flight, this flight of the ego, is put into operation in the narcissistic neuroses.

If, in schizophrenia, this flight consists in withdrawal of instinctual cathexis from the points which represent the *unconscious* presentation of the object, it may seem strange that the part of the presentation of this object which belongs to the system *Pcs.* - namely, the word-presentations corresponding to it - should, on the contrary, receive a more intense cathexis. We might rather expect that the word-presentation, being the preconscious part, would have to sustain the first impact of repression and that it would be totally uncathectable after repression had proceeded as far as the unconscious thing-presentations. This, it is true, is difficult to understand. It turns out that the cathexis of the word-presentation is not part of the act of repression, but represents the first of the attempts at recovery or cure which so conspicuously dominate the clinical picture of schizophrenia. These endeavours are directed towards regaining the lost object, and it may well be that to achieve this purpose they set off on a path that leads to the object *via* the verbal part of it, but then find themselves obliged to be content with words instead of things. It is a general truth that our mental activity moves in two opposite directions: either it starts from the instincts and passes through the system *Ucs.* to conscious thought-activity; or, beginning with an instigation from outside, it passes through the system *Cs.* and *Pcs.* till it reaches the *Ucs.* cathexes of the ego and objects. This second path must, in spite of the repression which has taken place, remain traversable, and it lies open to some extent to the endeavours made by the neurosis to regain its objects. When we think in abstractions there is a danger that we may neglect the relations of words to unconscious thing-presentations, and it must be confessed that the expression and content of our philosophizing then begins to acquire an unwelcome resemblance to the mode of operation of schizophrenics. We may, on the other hand, attempt a characterization of the schizophrenic's mode of thought by saying that he treats concrete things as though they were abstract.

If we have made a true assessment of the nature of the *Ucs.* and have correctly defined the difference between an unconscious and a preconscious presentation, then our researches will inevitably bring us back from many other points to this same piece of insight.

A METAPSYCHOLOGICAL SUPPLEMENT TO THE THEORY OF DREAMS
(1917 [1915])

Intentionally left blank

A METAPSYCHOLOGICAL SUPPLEMENT TO THE THEORY OF DREAMS ¹

We shall discover in various connections how much our enquiries benefit if certain states and phenomena which may be regarded as *normal prototypes* of pathological affections are brought up for purposes of comparison. Among these we may include such affective states as grief and being in love, as well as the state of sleep and the phenomenon of dreaming.

We are not in the habit of devoting much thought to the fact that every night human beings lay aside the wrappings in which they have enveloped their skin, as well as anything which they may use as a supplement to their bodily organs (so far as they have succeeded in making good those organs' deficiencies by substitutes), for instance, their spectacles, their false hair and teeth, and so on. We may add that when they go to sleep they carry out an entirely analogous undressing of their minds and lay aside most of their psychical acquisitions. Thus on both counts they approach remarkably close to the situation in which they began life. Somatically, sleep is a reactivation of intrauterine existence, fulfilling as it does the conditions of repose, warmth and exclusion of stimulus; indeed, in sleep many people resume the foetal posture. The psychical state of a sleeping person is characterized by an almost complete withdrawal from the surrounding world and a cessation of all interest in it.

In investigating psychoneurotic states, we find ourselves led to emphasize in each of them what are known as *temporal regressions*, i.e. the amount of developmental recession peculiar to it. We distinguish two such regressions - one affecting the development of the ego and the other that of the libido. In the state of sleep, the latter is carried to the point of restoring primitive narcissism, while the former goes back to the stage of hallucinatory satisfaction of wishes.

¹ This paper and the following one are derived from a collection which I originally intended to publish in book form under the title 'Zur Vorbereitung einer Metapsychologie' ['Preliminaries to a Metapsychology']. They follow on some papers which were printed in Volume III of the *Internationale Zeitschrift für ärztliche Psychoanalyse* ('Instincts and their Vicissitudes', 'Repression' and 'The Unconscious'). The intention of the series is to clarify and carry deeper the theoretical assumptions on which a psycho-analytic system could be founded.

It is, of course, the study of dreams which has taught us what we know of the psychical characteristics of the state of sleep. It is true that dreams only show us the dreamer in so far as he is *not* sleeping; nevertheless they are bound to reveal at the same time characteristics of sleep itself. We have come to know from observation some peculiarities of dreams which we could not at first understand, but which we can now fit into the picture without difficulty. Thus, we know that dreams are completely egoistic and that the person who plays the chief part in their scenes is always to be recognized as the dreamer. This is now easily to be accounted for by the narcissism of the state of sleep. Narcissism and egoism, indeed, coincide; the word 'narcissism' is only intended to emphasize the fact that egoism is a libidinal phenomenon as well; or, to put it in another way, narcissism may be described as the libidinal complement of egoism. The 'diagnostic' capacity of dreams - a phenomenon which is generally acknowledged, but regarded as puzzling - becomes equally comprehensible, too. In dreams, incipient physical disease is often detected earlier and more clearly than in waking life, and all the current bodily sensations assume gigantic proportions. This magnification is hypochondriacal in character; it is conditional upon the withdrawal of all psychical cathexes from the external world back on to the ego, and it makes possible early recognition of bodily changes which in waking life would still for a time have remained unobserved.

A dream tells us that something was going on which tended to interrupt sleep, and it enables us to understand in what way it has been possible to fend off this interruption. The final outcome is that the sleeper has dreamt and is able to go on sleeping; the internal demand which was striving to occupy him has been replaced by an external experience, whose demand has been disposed of. A dream is, therefore, among other things, a *projection*: an externalization of an internal process. We may recall that we have already met with projection elsewhere among the means adopted for defence. The mechanism of a hysterical phobia, too, culminates in the fact that the subject is able to protect himself by attempts at flight against an external danger which has taken the place of an internal instinctual claim. We will, however, defer the full treatment of projection till we come to analyse the narcissistic disorder in which this mechanism plays the most striking part.

In what way, however, can a case arise in which the intention to sleep meets with an interruption? The interruption may proceed from an internal excitation or from an external stimulus. Let us first consider the more obscure and more interesting case of interruption from within. Observation shows that dreams are instigated by residues from the previous day - thought-cathexes which have not submitted to the general withdrawal of cathexes, but have retained in spite of it a certain amount of libidinal or other interest. Thus the narcissism of sleep has from the outset had to admit an exception at this point, and it is here that the formation of dreams takes its start. In analysis we make the acquaintance of these 'day's residues' in the shape of latent dream-thoughts; and, both by reason of their nature and of the whole situation, we must regard them as preconscious ideas, as belonging to the system *Pcs*.

We cannot proceed any further in explaining the formation of dreams till we have overcome certain difficulties. The narcissism of the state of sleep implies a withdrawal of cathexis from all ideas of objects, from both the unconscious and the preconscious portions of those ideas. If, then, certain day's residues have retained their cathexis, we hesitate to suppose that they have acquired at night so much energy as to compel notice on the part of consciousness; we should be more inclined to suppose that the cathexis they have retained is far weaker than that which they possessed during the day. Here analysis saves us further speculation, for it shows that these day's residues must receive a reinforcement which has its source in unconscious instinctual impulses if they are to figure as constructors of dreams. This hypothesis presents no immediate difficulties, for we have every reason to suppose that in sleep the censorship between the *Pcs*. and the *Ucs*. is greatly reduced, so that communication between the two systems is made easier.

But there is another doubt, which we must not pass over in silence. If the narcissistic state of sleep has resulted in a drawing in of all the cathexes of the systems *Ucs.* and *Pcs.*, then there can no longer be any possibility of the preconscious day's residues being reinforced by unconscious instinctual impulses, seeing that these themselves have surrendered their cathexes to the ego. Here the theory of dream-formation ends up in a contradiction, unless we can rescue it by introducing a modification into our assumption about the narcissism of sleep.

A restrictive modification of this kind is, as we shall discover later, necessary in the theory of dementia praecox as well. This must be to the effect that the repressed portion of the system *Ucs.* does not comply with the wish to sleep that comes from the ego, that it retains its cathexis in whole or in part, and that in general, in consequence of repression, it has acquired a certain measure of independence of the ego. Accordingly, too, some amount of the expenditure on repression (anticathexis) would have to be maintained throughout the night, in order to meet the instinctual danger - though the inaccessibility of all paths leading to a release of affect and to motility may considerably diminish the height of the anticathexis that is necessary. Thus we should picture the situation which leads to the formation of dreams as follows. The wish to sleep endeavours to draw in all the cathexes sent out by the ego and to establish an absolute narcissism. This can only partly succeed, for what is repressed in the system *Ucs.* does not obey the wish to sleep. A part of the anticathexes has therefore to be maintained, and the censorship between the *Ucs.* and the *Pcs.* must remain, even if not at its full strength. So far as the dominance of the ego extends, all the systems are emptied of cathexes. The stronger the *Ucs.* instinctual cathexes are, the more unstable is sleep. We are acquainted, too, with the extreme case where the ego gives up the wish to sleep, because it feels unable to inhibit the repressed impulses set free during sleep - in other words, where it renounces sleep because of its fear of its dreams.

Later on we shall learn to recognize the momentous nature of this hypothesis regarding the unruliness of repressed impulses. For the present let us follow out the situation which occurs in dream-formation.

The possibility mentioned above - that some of the preconscious thoughts of the day may also prove resistant and retain a part of their cathexis - must be recognized as a second breach in narcissism. At bottom, the two cases may be identical. The resistance of the day's residues may originate in a link with unconscious impulses which is already in existence during waking life; or the process may be somewhat less simple, and the day's residues which have not been wholly emptied of cathexis may establish a connection with the repressed material only after the state of sleep has set in, thanks to the easing of communication between the *Pcs.* and the *Ucs.* In both cases there follows the same decisive step in dream-formation: the preconscious dream-wish is formed, which *gives expression to the unconscious impulse in the material of the preconscious day's residues*. This dream-wish must be sharply distinguished from the day's residues; it need not have existed in waking life and it may already display the irrational character possessed by everything that is unconscious when we translate it into the conscious. Again, the dream-wish must not be confused with the wishful impulses which may have been present, though they certainly need not necessarily be present, amongst the preconscious (latent) dream-thoughts. If, however, there *were* any such preconscious wishes, the dream-wish associates itself with them, as a most effective reinforcement of them.

We have now to consider the further vicissitudes undergone by this wishful impulse, which in its essence represents an unconscious instinctual demand and which has been formed in the *Pcs.* as a dream-wish (a wish-fulfilling phantasy). Reflection tells us that this wishful impulse may be dealt with along three different paths. It may follow the path that would be normal in waking life, by pressing from the *Pcs.* to consciousness; or it may bypass the *Cs.* and find direct motor discharge; or it may take the unexpected path which observation enables us in fact to trace. In the first case, it would become a *delusion* having as content the fulfilment of the wish; but in the state of sleep this never happens. With our scanty knowledge of the metapsychological conditions of mental processes, we may perhaps take this fact as a hint that a complete emptying of a system renders it little susceptible to instigation. The second case, that of direct motor discharge, should be excluded by the same principle; for access to motility normally lies yet another step beyond the censorship of consciousness. But we do meet with exceptional instances in which this happens, in the form of somnambulism. We do not know what conditions make this possible, or why it does not happen more often. What actually happens in dream-formation is a very remarkable and quite unforeseen turn of events. The process, begun in the *Pcs.* and reinforced by the *Ucs.*, pursues a backward course, through the *Ucs.* to perception, which is pressing upon consciousness. This *regression* is the third phase of dream-formation. For the sake of clarity, we will repeat the two earlier ones: the reinforcement of the *Pcs.* by the *Ucs.*, and the setting up of the dream-wish.

We call this kind of regression a *topographical* one, to distinguish it from the previously mentioned *temporal* or developmental regression. The two do not necessarily always coincide, but they do so in the particular example before us. The reversal of the course of the excitation from the *Pcs.* through the *Ucs.* to perception is at the same time a return to the early stage of hallucinatory wish-fulfilment.

We have already in *The Interpretation of Dreams* described the way in which the regression of the preconscious day's residues takes place in dream-formation. In this process thoughts are transformed into images, mainly of a visual sort; that is to say, word-presentations are taken back to the thing-presentations which correspond to them, as if, in general, the process were dominated by considerations of *representability*. When regression has been completed, a number of cathexes are left over in the system *Ucs.* - cathexes of memories of *things*. The primary psychical process is brought to bear on these memories, till, by condensation of them and displacement between their respective cathexes, it has shaped the manifest dream-content. Only where the word-presentations occurring in the day's residues are recent and current residues of *perceptions*, and not the expression of *thoughts*, are they themselves treated like thing-presentations, and subjected to the influence of condensation and displacement. Hence the rule laid down in *The Interpretation of Dreams*, and since confirmed beyond all doubt, that words and speeches in the dream-content are not freshly formed, but are modelled on speeches from the day preceding the dream (or on some other recent impressions, such as something that has been read). It is very noteworthy how little the dream-work keeps to the word-presentations; it is always ready to exchange one word for another till it finds the expression which is most handy for plastic representation.¹

¹ I also ascribe to considerations of representability the fact which is insisted on and perhaps over-estimated by Silberer that some dreams admit of two simultaneous, and yet essentially different interpretations, one of which he calls the 'analytic' and the other the 'anagogic'. When this happens, we are invariably concerned with thoughts of a very abstract nature, which must have made their representation in the dream very difficult. We might compare it with the problem of representing in pictures a leading article from a political newspaper. In such cases, the dream-work must first replace the text that consists of abstract thoughts by one more concrete, connected with the former in some way - by comparison, symbolism, allegorical allusion, or best of all, genetically - so that the more concrete text then takes the place of the abstract one as material for the dream-work. The abstract thoughts yield the so-called anagogic interpretation, which, in our interpretative work, we discover more easily than the true analytic one. Otto Rank has justly remarked that certain dreams about their treatment, dreamt by patients in analysis, are the best models on which to form a view of these dreams which admit of more than one interpretation.

Now it is in this respect that the essential difference between the dream-work and schizophrenia becomes clear. In the latter, what becomes the subject of modification by the primary process are the words themselves in which the preconscious thought was expressed; in dreams, what are subject to this modification are not the words, but the thing-presentations to which the words have been taken back. In dreams there is a topographical regression; in schizophrenia there is not. In dreams there is free communication between (*Pcs.*) word-cathexes and (*Ucs.*) thing-cathexes, while it is characteristic of schizophrenia that this communication is cut off. The impression this difference makes on one is lessened precisely by the dream-interpretations we carry out in psycho-analytic practice. For, owing to the fact that dream-interpretation traces the course taken by the dream-work, follows the paths which lead from the latent thoughts to the dream-elements, reveals the way in which verbal ambiguities have been exploited, and points out the verbal bridges between different groups of material - owing to all this, we get an impression now of a joke, now of schizophrenia, and are apt to forget that for a dream all operations with words are no more than a preparation for a regression to things.

The completion of the dream-process consists in the thought-content - regressively transformed and worked over into a wishful phantasy - becoming conscious as a sense-perception; while this is happening it undergoes secondary revision, to which every perceptual concept is subject. The dream-wish, as we say, is *hallucinated*, and, as a hallucination, meets with belief in the reality of its fulfilment. It is precisely round this concluding piece in the formation of dreams that the gravest uncertainties centre, and it is in order to clear them up that we are proposing to compare dreams with pathological states akin to them.

The formation of the wishful phantasy and its regression to hallucination are the most essential parts of the dream-work, but they do not belong exclusively to dreams. They are also found in two morbid states: in acute hallucinatory confusion (Meynert's 'amentia'), and in the hallucinatory phase of schizophrenia. The hallucinatory delirium of amentia is a clearly recognizable wishful phantasy, often completely well ordered like a perfect day-dream. One might speak quite generally of a 'hallucinatory wishful psychosis', and attribute it equally to dreams and amentia. There are even dreams which consist of nothing but undistorted wishful phantasies with a very rich content. The hallucinatory phase of schizophrenia has been less thoroughly studied; it seems as a rule to be of a composite nature, but in its essence it might well correspond to a fresh attempt at restitution, designed to restore a libidinal cathexis to the ideas of objects.¹ I cannot extend the comparison to the other hallucinatory states in various pathological disorders, because in their case I have no experience of my own upon which to draw, and cannot utilize that of other observers.

¹ In the paper on 'The Unconscious' we recognized the hypercathexis of word-presentations as a first attempt of this kind.

Let us be clear that the hallucinatory wishful psychosis - in dreams or elsewhere - achieves two by no means identical results. It not only brings hidden or repressed wishes into consciousness; it also represents them, with the subject's entire belief, as fulfilled. The concurrence of these two results calls for explanation. It is quite impossible to maintain that unconscious wishes must necessarily be taken for realities when once they have become conscious; for, as we know, our judgement is very well able to distinguish realities from ideas and wishes, however intense they may be. On the other hand, it seems justifiable to assume that belief in reality is bound up with perception through the senses. When once a thought has followed the path to regression as far back as to the unconscious memory-traces of objects and thence to perception, we accept the perception of it as real. So hallucination brings belief in reality with it. We now have to ask ourselves what determines the coming into being of a hallucination. The first answer would be regression, and this would replace the problem of the origin of hallucination by that of the mechanism of regression. As regards dreams, this latter problem need not remain long unanswered. Regression of *Pcs.* dream-thoughts to mnemic images of things is clearly the result of the attraction which the *Ucs.* instinctual representatives - e.g. repressed memories of experiences - exercise upon the thoughts which have been put into words. But we soon perceive that we are on a false scent. If the secret of hallucination is nothing else than that of regression, every regression of sufficient intensity would produce hallucination with belief in its reality. But we are quite familiar with situations in which a process of regressive reflection brings to consciousness very clear visual mnemic images, though we do not on that account for a single moment take them for real perceptions. Again, we could very well imagine the dream-work penetrating to mnemic images of this kind, making conscious to us that was previously unconscious, and holding up to us a wishful phantasy which rouses our longing, but which we should not regard as a real fulfilment of the wish. Hallucination must therefore be something more than the regressive revival of mnemic images that are in themselves *Ucs.*

Let us, furthermore, bear in mind the great practical importance of distinguishing perceptions from ideas, however intensely recalled. Our whole relation to the external world, to reality, depends on our ability to do so. We have put forward the fiction that we did not always possess this ability and that at the beginning of our mental life we did in fact hallucinate the satisfying object when we felt the need for it. But in such a situation satisfaction did not occur, and this failure must very soon have moved us to create some contrivance with the help of which it was possible to distinguish such wishful perceptions from a real fulfilment and to avoid them for the future. In other words, we gave up hallucinatory satisfaction of our wishes at a very early period and set up a kind of 'reality-testing'. The question now arises in what this reality-testing consisted, and how the hallucinatory wishful psychosis of dreams and amentia and similar conditions succeeds in abolishing it and in re-establishing the old mode of satisfaction.

The answer can be given if we now proceed to define more precisely the third of our psychical systems, the system *Cs.*, which hitherto we have not sharply distinguished from the *Pcs.* In *The Interpretation of Dreams* we were already led to a decision to regard conscious perception as the function of a special system, to which we ascribed certain curious properties, and to which we shall now have good grounds for attributing other characteristics as well. We may regard this system, which is there called the *Pcpt.*, as coinciding with the system *Cs.*, on whose activity becoming conscious usually depends. Nevertheless, even so, the fact of a thing's becoming conscious still does not wholly coincide with its belonging to a system, for we have learnt that it is possible to be aware of sensory mnemonic images to which we cannot possibly allow a psychical location in the systems *Cs.* or *Pcpt.*

We must, however, put off discussing this difficulty till we can focus our interest upon the system *Cs.* itself. In the present connection we may be allowed to assume that hallucination consists in a cathexis of the system *Cs.* (*Pcpt.*), which, however, is not effected - as normally - from without, but from within, and that a necessary condition for the occurrence of hallucination is that regression shall be carried far enough to reach this system itself and in so doing be able to pass over reality-testing.¹

In an earlier passage² we ascribed to the still helpless organism a capacity for making a first orientation in the world by means of its perceptions, distinguishing 'external' and 'internal' according to their relation to its muscular action. A perception which is made to disappear by an action is recognized as external, as reality; where such an action makes no difference, the perception originates within the subject's own body - it is not real. It is of value to the individual to possess a means such as this of recognizing reality, which at the same time helps him to deal with it, and he would be glad to be equipped with a similar power against the often merciless claims of his instincts. That is why he takes such pains to transpose outwards what becomes troublesome to him from within - that is, to *project* it.

¹ I may add by way of supplement that any attempt to explain hallucination would have to start out from *negative* rather than positive hallucination.

² 'Instincts and their Vicissitudes'.

This function of orientating the individual in the world by discrimination between what is internal and what is external must now, after detailed dissection of the mental apparatus, be ascribed to the system Cs. (*Pcpt.*) alone. The Cs. must have at its disposal a motor innervation which determines whether the perception can be made to disappear or whether it proves resistant. Reality-testing need be nothing more than this contrivance.¹ We can say nothing more precise on this point, for we know too little as yet of the nature and mode of operation of the system Cs. We shall place reality-testing among the major *institutions of the ego*, alongside the *ensorships* which we have come to recognize between the psychical systems, and we shall expect that the analysis of the narcissistic disorders will help to bring other similar institutions to light.

On the other hand, we can already learn from pathology the way in which reality-testing may be done away with or put out of action. We shall see this more clearly in the wishful psychosis of amentia than in that of dreams. Amentia is the reaction to a loss which reality affirms, but which the ego has to deny, since it finds it insupportable. Thereupon the ego breaks off its relation to reality; it withdraws the cathexis from the system of perceptions, Cs. - or rather, perhaps, it withdraws a cathexis, the special nature of which may be the subject of further enquiry. With this turning away from reality, reality-testing is got rid of, the (unrepressed, completely conscious) wishful phantasies are able to press forward into the system, and they are there regarded as a better reality. Such a withdrawal may be put on a par with the processes of repression. Amentia presents the interesting spectacle of a breach between the ego and one of its organs - one which had perhaps been its most faithful servant and had been bound up with it the most intimately.²

¹ Cf. a later passage on the distinction between testing with regard to reality and testing with regard to immediacy. [*'Relitätsprüfung'* and *'Aktualitätsprüfung'*.]

² I may venture to suggest in this connection that the toxic hallucinoses, too, e.g. alcoholic delirium, are to be understood in an analogous fashion. Here the unbearable loss imposed by reality would be precisely the loss of alcohol. When the latter is supplied, the hallucinations cease.

What is performed in amentia by this 'repression' is performed in dreams by voluntary renunciation. The state of sleep does not wish to know anything of the external world; it takes no interest in reality, or only so far as abandoning the state of sleep - waking up - is concerned. Hence it withdraws cathexis from the system *Cs.* as well as from the other systems, the *Pcs.* and the *Ucs.*, in so far as the cathexes in them obey the wish to sleep. With the system *Cs.* thus uncathected, the possibility of reality-testing is abandoned; and the excitations which, independently of the state of sleep, have entered on the path of regression will find that path clear as far as the system *Cs.* where they will count as undisputed reality.¹

As regards the hallucinatory psychosis of dementia praecox, we shall infer from our discussion that that psychosis cannot be among the initial symptoms of the affection. It becomes possible only when the patient's ego is so far disintegrated that reality-testing no longer stands in the way of hallucination.

In what concerns the psychology of dream-processes we arrive at the result that all the essential characteristics of dreams are determined by the conditioning factor of sleep. Aristotle was entirely right, long ago, in his modest pronouncement that dreams are the mental activity of the sleeper. We might expand this and say: they are a residue of mental activity, made possible by the fact that the narcissistic state of sleep has not been able to be completely established. This does not sound very different from what psychologists and philosophers have said all along, but it is based on quite different views about the structure and function of the mental apparatus. These views have this advantage over the earlier ones, that they have given us an understanding, too, of all the detailed characteristics of dreams.

Finally, let us once more glance at the significant light which the *topography* of the process of repression throws for us on the mechanism of mental disturbances. In dreams the withdrawal of cathexis (libido or interest) affects all systems equally; in the transference neuroses, the *Pcs.* cathexis is withdrawn; in schizophrenia, the cathexis of the *Ucs.*; in amentia, that of the *Cs.*

¹ Here the principle of the insusceptibility to excitation of uncathected systems appears to be invalidated in the case of the system *Cs.* (*Pcpt.*). But it may be a question of only the *partial* removal of cathexis; and for the perceptual system in especial we must assume many conditions for excitation which are widely divergent from those of other systems. - We are not, of course, intending to disguise or gloss over the uncertain and tentative character of these metapsychological discussions. Only deeper investigation can lead to the achievement of a certain degree of probability.

MOURNING AND MELANCHOLIA
(1917 [1915])

Intentionally left blank

MOURNING AND MELANCHOLIA

Dreams having served us as the prototype in normal life of narcissistic mental disorders, we will now try to throw some light on the nature of melancholia by comparing it with the normal affect of mourning. This time, however, we must begin by making an admission, as a warning against any over-estimation of the value of our conclusions. Melancholia, whose definition fluctuates even in descriptive psychiatry, takes on various clinical forms the grouping together of which into a single unity does not seem to be established with certainty; and some of these forms suggest somatic rather than psychogenic affections. Our material, apart from such impressions as are open to every observer, is limited to a small number of cases whose psychogenic nature was indisputable. We shall, therefore, from the outset drop all claim to general validity for our conclusions, and we shall console ourselves by reflecting that, with the means of investigation at our disposal to-day, we could hardly discover anything that was not typical, if not of a whole class of disorders, at least of a small group of them.

The correlation of melancholia and mourning seems justified by the general picture of the two conditions.¹ Moreover, the exciting causes due to environmental influences are, so far as we can discern them at all, the same for both conditions. Mourning is regularly the reaction to the loss of a loved person, or to the loss of some abstraction which has taken the place of one, such as one's country, liberty, an ideal, and so on. In some people the same influences produce melancholia instead of mourning and we consequently suspect them of a pathological disposition. It is also well worth notice that, although mourning involves grave departures from the normal attitude to life, it never occurs to us to regard it as a pathological condition and to refer it to medical treatment. We rely on its being overcome after a certain lapse of time, and we look upon any interference with it as useless or even harmful.

¹ Abraham (1912), to whom we owe the most important of the few analytic studies on this subject, also took this comparison as his starting point.

The distinguishing mental features of melancholia are a profoundly painful dejection, cessation of interest in the outside world, loss of the capacity to love, inhibition of all activity, and a lowering of the self-regarding feelings to a degree that finds utterance in self-reproaches and self-revilings, and culminates in a delusional expectation of punishment. This picture becomes a little more intelligible when we consider that, with one exception, the same traits are met with in mourning. The disturbance of self-regard is absent in mourning; but otherwise the features are the same. Profound mourning, the reaction to the loss of someone who is loved, contains the same painful frame of mind, the same loss of interest in the outside world - in so far as it does not recall him - the same loss of capacity to adopt any new object of love (which would mean replacing him) and the same turning away from any activity that is not connected with thoughts of him. It is easy to see that this inhibition and circumscription of the ego is the expression of an exclusive devotion to mourning which leaves nothing over for other purposes or other interests. It is really only because we know so well how to explain it that this attitude does not seem to us pathological.

We should regard it as an appropriate comparison, too, to call the mood of mourning a 'painful' one. We shall probably see the justification for this when we are in a position to give a characterization of the economics of pain.

In what, now, does the work which mourning performs consist? I do not think there is anything far-fetched in presenting it in the following way. Reality-testing has shown that the loved object no longer exists, and it proceeds to demand that all libido shall be withdrawn from its attachments to that object. This demand arouses understandable opposition - it is a matter of general observation that people never willingly abandon a libidinal position, not even, indeed, when a substitute is already beckoning to them. This opposition can be so intense that a turning away from reality takes place and a clinging to the object through the medium of a hallucinatory wishful psychosis.¹ Normally, respect for reality gains the day. Nevertheless its orders cannot be obeyed at once. They are carried out bit by bit, at great expense of time and cathectic energy, and in the meantime the existence of the lost object is psychically prolonged. Each single one of the memories and expectations in which the libido is bound to the object is brought up and hypercathected, and detachment of the libido is accomplished in respect of it. Why this compromise by which the command of reality is carried out piecemeal should be so extraordinarily painful is not at all easy to explain in terms of economics. It is remarkable that this painful unpleasure is taken as a matter of course by us. The fact is, however, that when the work of mourning is completed the ego becomes free and uninhibited again.

¹ Cf. the preceding paper.

Let us now apply to melancholia what we have learnt about mourning. In one set of cases it is evident that melancholia too may be the reaction to the loss of a loved object. Where the exciting causes are different one can recognize that there is a loss of a more ideal kind. The object has not perhaps actually died, but has been lost as an object of love (e.g. in the case of a betrothed girl who has been jilted). In yet other cases one feels justified in maintaining the belief that a loss of this kind has occurred, but one cannot see clearly what it is that has been lost, and it is all the more reasonable to suppose that the patient cannot consciously perceive what he has lost either. This, indeed, might be so even if the patient is aware of the loss which has given rise to his melancholia, but only in the sense that he knows *whom* he has lost but not *what* he has lost in him. This would suggest that melancholia is in some way related to an object-loss which is withdrawn from consciousness, in contradistinction to mourning, in which there is nothing about the loss that is unconscious.

In mourning we found that the inhibition and loss of interest are fully accounted for by the work of mourning in which the ego is absorbed. In melancholia, the unknown loss will result in a similar internal work and will therefore be responsible for the melancholic inhibition. The difference is that the inhibition of the melancholic seems puzzling to us because we cannot see what it is that is absorbing him so entirely. The melancholic displays something else besides which is lacking in mourning - an extraordinary diminution in his self-regard, an impoverishment of his ego on a grand scale. In mourning it is the world which has become poor and empty; in melancholia it is the ego itself. The patient represents his ego to us as worthless, incapable of any achievement and morally despicable; he reproaches himself, vilifies himself and expects to be cast out and punished. He abases himself before everyone and commiserates with his own relatives for being connected with anyone so unworthy. He is not of the opinion that a change has taken place in him, but extends his self-criticism back over the past; he declares that he was never any better. This picture of a delusion of (mainly moral) inferiority is completed by sleeplessness and refusal to take nourishment, and - what is psychologically very remarkable - by an overcoming of the instinct which compels every living thing to cling to life.

It would be equally fruitless from a scientific and a therapeutic point of view to contradict a patient who brings these accusations against his ego. He must surely be right in some way and be describing something that is as it seems to him to be. Indeed, we must at once confirm some of his statements without reservation. He really is as lacking in interest and as incapable of love and achievement as he says. But that, as we know, is secondary; it is the effect of the internal work which is consuming his ego work which is unknown to us but which is comparable to the work of mourning. He also seems to us justified in certain other self-accusations; it is merely that he has a keener eye for the truth than other people who are not melancholic. When in his heightened self-criticism he describes himself as petty, egoistic, dishonest, lacking in independence, one whose sole aim has been to hide the weaknesses of his own nature, it may be, so far as we know, that he has come pretty near to understanding himself; we only wonder why a man has to be ill before he can be accessible to a truth of this kind. For there can be no doubt that if anyone holds and expresses to others an opinion of himself such as this (an opinion which Hamlet held both of himself and of everyone else ¹), he is ill, whether he is speaking the truth or whether he is being more or less unfair to himself. Nor is it difficult to see that there is no correspondence, so far as we can judge, between the degree of self-abasement and its real justification. A good, capable, conscientious woman will speak no better of herself after she develops melancholia than one who is in fact worthless; indeed, the former is perhaps more likely to fall ill of the disease than the latter, of whom we too should have nothing good to say. Finally, it must strike us that after all the melancholic does not behave in quite the same way as a person who is crushed by remorse and self-reproach in a normal fashion. Feelings of shame in front of other people, which would more than anything characterize this latter condition, are lacking in the melancholic, or at least they are not prominent in him. One might emphasize the presence in him of an almost opposite trait of insistent communicativeness which finds satisfaction in self-exposure.

¹ 'Use every man after his desert, and who shall scape whipping?' (Act II, Scene 2).

The essential thing, therefore, is not whether the melancholic's distressing self-denigration is correct, in the sense that his self-criticism agrees with the opinion of other people. The point must rather be that he is giving a correct description of his psychological situation. He has lost his self-respect and he must have good reason for this. It is true that we are then faced with a contradiction that presents a problem which is hard to solve. The analogy with mourning led us to conclude that he had suffered a loss in regard to an object; what he tells us points to a loss in regard to his ego.

Before going into this contradiction, let us dwell for a moment on the view which the melancholic's disorder affords of the constitution of the human ego. We see how in him one part of the ego sets itself over against the other, judges it critically, and, as it were, takes it as its object. Our suspicion that the critical agency which is here split off from the ego might also show its independence in other circumstances will be confirmed by every further observation. We shall really find grounds for distinguishing this agency from the rest of the ego. What we are here becoming acquainted with is the agency commonly called 'conscience'; we shall count it, along with the censorship of consciousness and reality-testing, among the major institutions of the ego, and we shall come upon evidence to show that it can become diseased on its own account. In the clinical picture of melancholia, dissatisfaction with the ego on moral grounds is the most outstanding feature. The patient's self-evaluation concerns itself much less frequently with bodily infirmity, ugliness or weakness, or with social inferiority; of this category, it is only his fears and asseverations of becoming poor that occupy a prominent position.

There is one observation, not at all difficult to make, which leads to the explanation of the contradiction mentioned above. If one listens patiently to a melancholic's many and various self-accusations, one cannot in the end avoid the impression that often the most violent of them are hardly at all applicable to the patient himself, but that with insignificant modifications they do fit someone else, someone whom the patient loves or has loved or should love. Every time one examines the facts this conjecture is confirmed. So we find the key to the clinical picture: we perceive that the self-reproaches are reproaches against a loved object which have been shifted away from it on to the patient's own ego.

The woman who loudly pities her husband for being tied to such an incapable wife as herself is really accusing her *husband* of being incapable, in whatever sense she may mean this. There is no need to be greatly surprised that a few genuine self-reproaches are scattered among those that have been transposed back. These are allowed to obtrude themselves, since they help to mask the others and make recognition of the true state of affairs impossible. Moreover, they derive from the *pros* and *cons* of the conflict of love that has led to the loss of love. The behaviour of the patients, too, now becomes much more intelligible. Their complaints are really 'plaints' in the old sense of the word. They are not ashamed and do not hide themselves, since everything derogatory that they say about themselves is at bottom said about someone else. Moreover, they are far from evincing towards those around them the attitude of humility and submissiveness that would alone befit such worthless people. On the contrary, they make the greatest nuisance of themselves, and always seem as though they felt slighted and had been treated with great injustice. All this is possible only because the reactions expressed in their behaviour still proceed from a mental constellation of revolt, which has then, by a certain process, passed over into the crushed state of melancholia.

There is no difficulty in reconstructing this process. An object choice, an attachment of the libido to a particular person, had at one time existed; then, owing to a real slight or disappointment coming from this loved person, the relationship was shattered. The result was not the normal one of a withdrawal of the libido from this object and a displacement of it on to a new one, but something different, for whose coming about various conditions seem to be necessary. The object-cathexis proved to have little power of resistance and was brought to an end. But the free libido was not displaced on to another object; it was withdrawn into the ego. There, however, it was not employed in any unspecified way, but served to establish an *identification* of the ego with the abandoned object. Thus the shadow of the object fell upon the ego, and the latter could henceforth be judged by a special agency, as though it were an object, the forsaken object. In this way an object-loss was transformed into an ego-loss and the conflict between the ego and the loved person into a cleavage between the critical activity of the ego and the ego as altered by identification.

One or two things may be directly inferred with regard to the preconditions and effects of a process such as this. On the one hand, a strong fixation to the loved object must have been present; on the other hand, in contradiction to this, the object-cathexis must have had little power of resistance. As Otto Rank has aptly remarked, this contradiction seems to imply that the object-choice has been effected on a narcissistic basis, so that the object-cathexis, when obstacles come in its way, can regress to narcissism. The narcissistic identification with the object then becomes a substitute for the erotic cathexis, the result of which is that in spite of the conflict with the loved person the love-relation need not be given up. This substitution of identification for object-love is an important mechanism in the narcissistic affections; Karl Landauer (1914) has lately been able to point to it in the process of recovery in a case of schizophrenia. It represents, of course, a *regression* from one type of object-choice to original narcissism. We have elsewhere shown that identification is a preliminary stage of object-choice, that it is the first way - and one that is expressed in an ambivalent fashion - in which the ego picks out an object. The ego wants to incorporate this object into itself, and, in accordance with the oral or cannibalistic phase of libidinal development in which it is, it wants to do so by devouring it. Abraham is undoubtedly right in attributing to this connection the refusal of nourishment met with in severe forms of melancholia.

The conclusion which our theory would require - namely, that the disposition to fall ill of melancholia (or some part of that disposition) lies in the predominance of the narcissistic type of object-choice - has unfortunately not yet been confirmed by observation. In the opening remarks of this paper, I admitted that the empirical material upon which this study is founded is insufficient for our needs. If we could assume an agreement between the results of observation and what we have inferred, we should not hesitate to include this regression from object-cathexis to the still narcissistic oral phase of the libido in our characterization of melancholia. Identifications with the object are by no means rare in the transference neuroses either; indeed, they are a well-known mechanism of symptom-formation, especially in hysteria. The difference, however, between narcissistic and hysterical identification may be seen in this: that, whereas in the former the object-cathexis is abandoned, in the latter it persists and manifests its influence, though this is usually confined to certain isolated actions and innervations. In any case, in the transference neuroses, too, identification is the expression of there being something in common, which may signify love. Narcissistic identification is the older of the two and it paves the way to an understanding of hysterical identification, which has been less thoroughly studied.

Melancholia, therefore, borrows some of its features from mourning, and the others from the process of regression from narcissistic object-choice to narcissism. It is on the one hand, like mourning, a reaction to the real loss of a loved object; but over and above this, it is marked by a determinant which is absent in normal mourning or which, if it is present, transforms the latter into pathological mourning. The loss of a love-object is an excellent opportunity for the ambivalence in love-relationships to make itself effective and come into the open. Where there is a disposition to obsessional neurosis the conflict due to ambivalence gives a pathological cast to mourning and forces it to express itself in the form of self-reproaches to the effect that the mourner himself is to blame for the loss of the loved object, i.e. that he has willed it. These obsessional states of depression following upon the death of a loved person show us what the conflict due to ambivalence can achieve by itself when there is no regressive drawing-in of libido as well. In melancholia, the occasions which give rise to the illness extend for the most part beyond the clear case of a loss by death, and include all those situations of being slighted, neglected or disappointed, which can import opposed feelings of love and hate into the relationship or reinforce an already existing ambivalence. This conflict due to ambivalence, which sometimes arises more from real experiences, sometimes more from constitutional factors, must not be overlooked among the preconditions of melancholia. If the love for the object - a love which cannot be given up though the object itself is given up - takes refuge in narcissistic identification, then the hate comes into operation on this substitutive object, abusing it, debasing it, making it suffer and deriving sadistic satisfaction from its suffering. The self-tormenting in melancholia, which is without doubt enjoyable, signifies, just like the corresponding phenomenon in obsessional neurosis, a satisfaction of trends of sadism and hate¹ which relate to an object, and which have been turned round upon the subject's own self in the ways we have been discussing. In both disorders the patients usually still succeed, by the circuitous path of self-punishment, in taking revenge on the original object and in tormenting their loved one through their illness, having resorted to it in order to avoid the need to express their hostility to him openly. After all, the person who has occasioned the patient's emotional disorder, and on whom his illness is centred, is usually to be found in his immediate environment. The melancholic's erotic cathexis in regard to his object has thus undergone a double vicissitude: part of it has regressed to identification, but the other part, under the influence of the conflict due to 'ambivalence', has been carried back to the stage of sadism which is nearer to that conflict.

¹ For the distinction between the two, see my paper on 'Instincts and their Vicissitudes'.

It is this sadism alone that solves the riddle of the tendency to suicide which makes melancholia so interesting - and so dangerous. So immense is the ego's self-love, which we have come to recognize as the primal state from which instinctual life proceeds, and so vast is the amount of narcissistic libido which we see liberated in the fear that emerges at a threat to life, that we cannot conceive how that ego can consent to its own destruction. We have long known, it is true, that no neurotic harbours thoughts of suicide which he has not turned back upon himself from murderous impulses against others, but we have never been able to explain what interplay of forces can carry such a purpose through to execution. The analysis of melancholia now shows that the ego can kill itself only if, owing to the return of the object-cathexis, it can treat itself as an object - if it is able to direct against itself the hostility which relates to an object and which represents the ego's original reaction to objects in the external world.¹ Thus in regression from narcissistic object-choice the object has, it is true, been got rid of, but it has nevertheless proved more powerful than the ego itself. In the two opposed situations of being most intensely in love and of suicide the ego is overwhelmed by the object, though in totally different ways.

As regards one particular striking feature of melancholia that we have mentioned, the prominence of the fear of becoming poor, it seems plausible to suppose that it is derived from anal erotism which has been torn out of its context and altered in a regressive sense.

Melancholia confronts us with yet other problems, the answer to which in part eludes us. The fact that it passes off after a certain time has elapsed without leaving traces of any gross changes is a feature it shares with mourning. We found by way of explanation that in mourning time is needed for the command of reality-testing to be carried out in detail, and that when this work has been accomplished the ego will have succeeded in freeing its libido from the lost object. We may imagine that the ego is occupied with analogous work during the course of a melancholia; in neither case have we any insight into the economics of the course of events. The sleeplessness in melancholia testifies to the rigidity of the condition, the impossibility of effecting the general drawing-in of cathexes necessary for sleep. The complex of melancholia behaves like an open wound, drawing to itself cathectic energies - which in the transference neuroses we have called 'anticathexes' - from all directions, and emptying the ego until it is totally impoverished. It can easily prove resistant to the ego's wish to sleep.

What is probably a somatic factor, and one which cannot be explained psychogenically, makes itself visible in the regular amelioration in the condition that takes place towards evening. These considerations bring up the question whether a loss in the ego irrespectively of the object - a purely narcissistic blow to the ego - may not suffice to produce the picture of melancholia and whether an impoverishment of ego-libido directly due to toxins may not be able to produce certain forms of the disease.

¹ Cf. 'Instincts and their Vicissitudes'.

The most remarkable characteristic of melancholia, and the one in most need of explanation, is its tendency to change round into mania - a state which is the opposite of it in its symptoms. As we know, this does not happen to every melancholia. Some cases run their course in periodic relapses, during the intervals between which signs of mania may be entirely absent or only very slight. Others show the regular alternation of melancholic and manic phases which has led to the hypothesis of a circular insanity. One would be tempted to regard these cases as non-psychogenic, if it were not for the fact that the psycho-analytic method has succeeded in arriving at a solution and effecting a therapeutic improvement in several cases precisely of this kind. It is not merely permissible, therefore, but incumbent upon us to extend an analytic explanation of melancholia to mania as well.

I cannot promise that this attempt will prove entirely satisfactory. It hardly carries us much beyond the possibility of taking one's initial bearings. We have two things to go upon: the first is a psycho-analytic impression, and the second what we may perhaps call a matter of general economic experience. The impression which several psycho-analytic investigators have already put into words is that the content of mania is no different from that of melancholia, that both disorders are wrestling with the same 'complex', but that probably in melancholia the ego has succumbed to the complex whereas in mania it has mastered it or pushed it aside. Our second pointer is afforded by the observation that all states such as joy, exultation or triumph, which give us the normal model for mania, depend on the same economic conditions. What has happened here is that, as a result of some influence, a large expenditure of psychical energy, long maintained or habitually occurring, has at last become unnecessary, so that it is available for numerous applications and possibilities of discharge - when, for instance, some poor wretch, by winning a large sum of money, is suddenly relieved from chronic worry about his daily bread, or when a long and arduous struggle is finally crowned with success, or when a man finds himself in a position to throw off at a single blow some oppressive compulsion, some false position which he has long had to keep up, and so on. All such situations are characterized by high spirits, by the signs of discharge of joyful emotion and by increased readiness for all kinds of action - in just the same way as in mania, and in complete contrast to the depression and inhibition of melancholia. We may venture to assert that mania is nothing other than a triumph of this sort, only that here again what the ego has surmounted and what it is triumphing over remain hidden from it. Alcoholic intoxication, which belongs to the same class of states, may (in so far as it is an elated one) be explained in the same way; here there is probably a suspension, produced by toxins, of expenditures of energy in repression. The popular view likes to assume that a person in a manic state of this kind finds such delight in movement and action because he is so 'cheerful'. This false connection must of course be put right. The fact is that the economic condition in the subject's mind referred to above has been fulfilled, and this is the reason why he is in such high spirits on the one hand and so uninhibited in action on the other.

If we put these two indications together, what we find is this. In mania, the ego must have got over the loss of the object (or its mourning over the loss, or perhaps the object itself), and thereupon the whole quota of anticathexis which the painful suffering of melancholia had drawn to itself from the ego and 'bound' will have become available. Moreover, the manic subject plainly demonstrates his liberation from the object which was the cause of his suffering, by seeking like a ravenously hungry man for new object-cathexes.

This explanation certainly sounds plausible, but in the first place it is too indefinite, and, secondly, it gives rise to more new problems and doubts than we can answer. We will not evade a discussion of them, even though we cannot expect it to lead us to a clear understanding.

In the first place, normal mourning, too, overcomes the loss of the object, and it, too, while it lasts, absorbs all the energies of the ego. Why, then, after it has run its course, is there no hint in its case of the economic condition for a phase of triumph? I find it impossible to answer this objection straight away. It also draws our attention to the fact that we do not even know the economic means by which mourning carries out its task. Possibly, however, a conjecture will help us here. Each single one of the memories and situations of expectancy which demonstrate the libido's attachment to the lost object is met by the verdict of reality that the object no longer exists; and the ego, confronted as it were with the question whether it shall share this fate, is persuaded by the sum of the narcissistic satisfactions it derives from being alive to sever its attachment to the object that has been abolished. We may perhaps suppose that this work of severance is so slow and gradual that by the time it has been finished the expenditure of energy necessary for it is also dissipated.¹

It is tempting to go on from this conjecture about the work of mourning and try to give an account of the work of melancholia. Here we are met at the outset by an uncertainty. So far we have hardly considered melancholia from the topographical point of view, nor asked ourselves in and between what psychical systems the work of melancholia goes on. What part of the mental processes of the disease still takes place in connection with the unconscious object-cathexes that have been given up, and what part in connection with their substitute, by identification, in the ego?

¹ The economic standpoint has hitherto received little attention in psycho-analytic writings. I would mention as an exception a paper by Victor Tausk (1913) on motives for repression devalued by recompenses.

The quick and easy answer is that 'the unconscious (thing-) presentation of the object has been abandoned by the libido'. In reality, however, this presentation is made up of innumerable single impressions (or unconscious traces of them), and this withdrawal of libido is not a process that can be accomplished in a moment, but must certainly, as in mourning, be one in which progress is long-drawn-out and gradual. Whether it begins simultaneously at several points or follows some sort of fixed sequence is not easy to decide; in analyses it often becomes evident that first one and then another memory is activated, and that the laments which always sound the same and are wearisome in their monotony nevertheless take their rise each time in some different unconscious source. If the object does not possess this great significance for the ego - a significance reinforced by a thousand links - then, too, its loss will not be of a kind to cause either mourning or melancholia. This characteristic of detaching the libido bit by bit is therefore to be ascribed alike to mourning and to melancholia; it is probably supported by the same economic situation and serves the same purposes in both.

As we have seen, however, melancholia contains something more than normal mourning. In melancholia the relation to the object is no simple one; it is complicated by the conflict due to ambivalence. The ambivalence is either constitutional, i.e. is an element of every love-relation formed by this particular ego, or else it proceeds precisely from those experiences that involved the threat of losing the object. For this reason the exciting causes of melancholia have a much wider range than those of mourning, which is for the most part occasioned only by a real loss of the object, by its death. In melancholia, accordingly, countless separate struggles are carried on over the object, in which hate and love contend with each other; the one seeks to detach the libido from the object, the other to maintain this position of the libido against the assault. The location of these separate struggles cannot be assigned to any system but the *Ucs.*, the region of the memory-traces of *things* (as contrasted with *word-cathexes*). In mourning, too, the efforts to detach the libido are made in this same system; but in it nothing hinders these processes from proceeding along the normal path through the *Pcs.* to consciousness. This path is blocked for the work of melancholia, owing perhaps to a number of causes or a combination of them. Constitutional ambivalence belongs by its nature to the repressed; traumatic experiences in connection with the object may have activated other repressed material. Thus everything to do with these struggles due to ambivalence remains withdrawn from consciousness, until the outcome characteristic of melancholia has set in. This, as we know, consists in the threatened libidinal cathexis at length abandoning the object, only, however, to draw back to the place in the ego from which it had proceeded. So by taking flight into the ego love escapes extinction. After this regression of the libido the process can become conscious, and it is represented to consciousness as a conflict between one part of the ego and the critical agency.

What consciousness is aware of in the work of melancholia is thus not the essential part of it, nor is it even the part which we may credit with an influence in bringing the ailment to an end. We see that the ego debases itself and rages against itself, and we understand as little as the patient what this can lead to and how it can change. We can more readily attribute such a function to the *unconscious* part of the work, because it is not difficult to perceive an essential analogy between the work of melancholia and of mourning. Just as mourning impels the ego to give up the object by declaring the object to be dead and offering the ego the inducement of continuing to live, so does each single struggle of ambivalence loosen the fixation of the libido to the object by disparaging it, denigrating it and even as it were killing it. It is possible for the process in the *Ucs.* to come to an end, either after the fury has spent itself or after the object has been abandoned as valueless. We cannot tell which of these two possibilities is the regular or more usual one in bringing melancholia to an end, nor what influence this termination has on the future course of the case. The ego may enjoy in this the satisfaction of knowing itself as the better of the two, as superior to the object.

Even if we accept this view of the work of melancholia, it still does not supply an explanation of the one point on which we were seeking light. It was our expectation that the economic condition for the emergence of mania after the melancholia has run its course is to be found in the ambivalence which dominates the latter affection; and in this we found support from analogies in various other fields. But there is one fact before which that expectation must bow. Of the three preconditions of melancholia - loss of the object, ambivalence, and regression of libido into the ego - the first two are also found in the obsessional self-reproaches arising after a death has occurred. In those cases it is unquestionably the ambivalence which is the motive force of the conflict, and observation shows that after the conflict has come to an end there is nothing left over in the nature of the triumph of a manic state of mind. We are thus led to the third factor as the only one responsible for the result. The accumulation of cathexis which is at first bound and then, after the work of melancholia is finished, becomes free and makes mania possible must be linked with regression of the libido to narcissism. The conflict within the ego, which melancholia substitutes for the struggle over the object, must act like a painful wound which calls for an extraordinarily high anticathexis. - But here once again, it will be well to call a halt and to postpone any further explanation of mania until we have gained some insight into the economic nature, first, of physical pain, and then of the mental pain which is analogous to it. As we already know, the interdependence of the complicated problems of the mind forces us to break off every enquiry before it is completed - till the outcome of some other enquiry can come to its assistance.¹

¹ [Footnote added 1925:] Cf. a continuation of this discussion of mania in *Group Psychology and the Analysis of the Ego* (1921c).

A CASE OF PARANOIA RUNNING COUNTER TO THE PSYCHO-ANALYTIC
THEORY OF THE DISEASE
(1915)

Intentionally left blank

A CASE OF PARANOIA RUNNING COUNTER TO THE PSYCHO-ANALYTIC THEORY OF THE DISEASE

Some years ago a well-known lawyer consulted me about a case which had raised some doubts in his mind. A young woman had asked him to protect her from the molestations of a man who had drawn her into a love-affair. She declared that this man had abused her confidence by getting unseen witnesses to photograph them while they were making love, and that by exhibiting these pictures it was now in his power to bring disgrace on her and force her to resign the post she occupied. Her legal adviser was experienced enough to recognize the pathological stamp of this accusation; he remarked, however, that, as what appears to be incredible often actually happens, he would appreciate the opinion of a psychiatrist in the matter. He promised to call on me again, accompanied by the plaintiff.

(Before I continue the account, I must confess that I have altered the *milieu* of the case in order to preserve the incognito of the people concerned, but that I have altered nothing else. I consider it a wrong practice, however excellent the motive may be, to alter any detail in the presentation of a case. One can never tell what aspect of a case may be picked out by a reader of independent judgement, and one runs the risk of leading him astray.)

Shortly afterwards I met the patient in person. She was thirty years old, a most attractive and handsome girl, who looked much younger than her age and was of a distinctly feminine type. She obviously resented the interference of a doctor and took no trouble to hide her distrust. It was clear that only the influence of her legal adviser, who was present, induced her to tell me the story which follows and which set me a problem that will be mentioned later. Neither in her manner nor by any kind of expression of emotion did she betray the slightest shame or shyness, such as one would have expected her to feel in the presence of a stranger. She was completely under the spell of the apprehension brought on by her experience.

For many years she had been on the staff of a big business concern, in which she held a responsible post. Her work had given her satisfaction and had been appreciated by her superiors. She had never sought any love-affairs with men, but had lived quietly with her old mother, of whom she was the sole support. She had no brothers or sisters; her father had died many years before. Recently an employee in her office, a highly cultivated and attractive man, had paid her attentions and she in turn had been drawn towards him. For external reasons, marriage was out of the question, but the man would not hear of giving up their relationship on that account. He had pleaded that it was senseless to sacrifice to social convention all that they both longed for and had an indisputable right to enjoy, something that could enrich their life as nothing else could. As he had promised not to expose her to any risk, she had at last consented to visit him in his bachelor rooms in the daytime. There they kissed and embraced as they lay side by side, and he began to admire the charms which were now partly revealed. In the midst of this idyllic scene she was suddenly frightened by a noise, a kind of knock or click. It came from the direction of the writing-desk, which was standing across the window; the space between desk and window was partly taken up by a heavy curtain. She had at once asked her friend what this noise meant, and was told, so she said, that it probably came from the small clock on the writing-desk. I shall venture, however, to make a comment presently on this part of her narrative.

As she was leaving the house she had met two men on the staircase, who whispered something to each other when they saw her. One of the strangers was carrying something which was wrapped up and looked like a small box. She was much exercised over this meeting, and on her way home she had already put together the following notions: the box might easily have been a camera, and the man a photographer who had been hidden behind the curtain while she was in the room; the click had been the noise of the shutter; the photograph had been taken as soon as he saw her in a particularly compromising position which he wished to record. From that moment nothing could abate her suspicion of her lover. She pursued him with reproaches and pestered him for explanations and reassurances, not only when they met but also by letter. But it was in vain that he tried to convince her that his feelings were sincere and that her suspicions were entirely without foundation. At last she called on the lawyer, told him of her experience and handed over the letters which the suspect had written to her about the incident. Later I had an opportunity of seeing some of these letters. They made a very favourable impression on me, and consisted mainly in expressions of regret that such a beautiful and tender relationship should have been destroyed by this 'unfortunate morbid idea'.

I need hardly justify my agreement with this judgement. But the case had a special interest for me other than a merely diagnostic one. The view had already been put forward in psycho-analytic literature that patients suffering from paranoia are struggling against an intensification of their homosexual trends - a fact pointing back to a narcissistic object-choice. And a further interpretation had been made: that the persecutor is at bottom someone whom the patient loves or has loved in the past. A synthesis of the two propositions would lead us to the necessary conclusion that the persecutor must be of the same sex as the person persecuted. We did not maintain, it is true, as universally and without exception valid the thesis that paranoia is determined by homosexuality; but this was only because our observations were not sufficiently numerous; the thesis was one of those which in view of certain considerations become important only when universal application can be claimed for them. In psychiatric literature there is certainly no lack of cases in which the patient imagines himself persecuted by a person of the opposite sex. It is one thing, however, to read of such cases, and quite a different thing to come into personal contact with one of them. My own observations and analyses and those of my friends had so far confirmed the relation between paranoia and homosexuality without any difficulty. But the present case emphatically contradicted it. The girl seemed to be defending herself against love for a man by directly transforming the lover into a persecutor: there was no sign of the influence of a woman, no trace of a struggle against a homosexual attachment.

In these circumstances the simplest thing would have been to abandon the theory that the delusion of persecution invariably depends on homosexuality, and at the same time to abandon everything that followed from that theory. Either the theory must be given up or else, in view of this departure from our expectations, we must side with the lawyer and assume that this was no paranoic combination but an actual experience which had been correctly interpreted. But I saw another way out, by which a final verdict could for the moment be postponed. I recollected how often wrong views have been taken about people who are ill psychically, simply because the physician has not studied them thoroughly enough and has thus not learnt enough about them. I therefore said that I could not form an immediate opinion, and asked the patient to call on me a second time, when she could relate her story again at greater length and add any subsidiary details that might have been omitted. Thanks to the lawyer's influence I secured this promise from the reluctant patient; and he helped me in another way by saying that at our second meeting his presence would be unnecessary.

The story told me by the patient on this second occasion did not conflict with the previous one, but the additional details she supplied resolved all doubts and difficulties. To begin with, she had visited the young man in his rooms not once but twice. It was on the second occasion that she had been disturbed by the suspicious noise: in her original story she had suppressed, or omitted to mention, the first visit because it had no longer seemed of importance to her. Nothing noteworthy had happened during this first visit, but something did happen on the day after it. Her department in the business was under the direction of an elderly lady whom she described as follows: 'She has white hair like my mother.' This elderly superior had a great liking for her and treated her with affection, though some times she teased her; the girl regarded herself as her particular favourite. On the day after her first visit to the young man's rooms he appeared in the office to discuss some business matter with this elderly lady. While they were talking in low voices the patient suddenly felt convinced that he was telling her about their adventure of the previous day - indeed, that the two of them had for some time been having a love-affair, which she had hitherto overlooked. The white-haired motherly old lady now knew everything, and her speech and conduct in the course of the day confirmed the patient's suspicion. At the first opportunity she took her lover to task about his betrayal. He naturally protested vigorously against what he called a senseless accusation. For the time being, in fact, he succeeded in freeing her from her delusion, and she regained enough confidence to repeat her visit to his rooms a short time - I believe it was a few weeks - afterwards. The rest we know already from her first narrative.

In the first place, this new information removes any doubts as to the pathological nature of her suspicion. It is easy to see that the white-haired elderly superior was a substitute for her mother, that in spite of his youth her lover had been put in the place of her father, and that it was the strength of her mother-complex which had driven the patient to suspect a love-relationship between these ill-matched partners, however unlikely such a relation might be. Moreover, this disposes of the apparent contradiction to the expectation, based on psycho-analytic theory, that the development of a delusion of persecution will turn out to be determined by an over-powerful homosexual attachment. The *original* persecutor - the agency whose influence the patient wishes to escape - is here again not a man but a woman. The superior knew about the girl's love affairs, disapproved of them, and showed her disapproval by mysterious hints. The patient's attachment to her own sex opposed her attempts to adopt a person of the other sex as a love-object. Her love for her mother had become the spokesman of all those tendencies which, playing the part of a 'conscience', seek to arrest a girl's first step along the new road to normal sexual satisfaction - in many respects a dangerous one; and indeed it succeeded in disturbing her relation with men.

When a mother hinders or arrests a daughter's sexual activity, she is fulfilling a normal function whose lines are laid down by events in childhood, which has powerful, unconscious motives, and has received the sanction of society. It is the daughter's business to emancipate herself from this influence and to decide for herself on broad and rational grounds what her share of enjoyment or denial of sexual pleasure shall be. If in the attempt to emancipate herself she falls a victim to a neurosis it implies the presence of a mother-complex which is as a rule over-powerful, and is certainly unmastered. The conflict between this complex and the new direction taken by the libido is dealt with in the form of one neurosis or another, according to the subject's disposition. The manifestation of the neurotic reaction will always be determined, however, not by her present-day relation to her actual mother but by her infantile relations to her earliest image of her mother.

We know that our patient had been fatherless for many years: we may also assume that she would not have kept away from men up to the age of thirty if she had not been supported by a powerful emotional attachment to her mother. This support became a heavy yoke when her libido began to turn to a man in response to his insistent wooing. She tried to free herself, to throw off her homosexual attachment; and her disposition, which need not be discussed here, enabled this to occur in the form of a paranoid delusion. The mother thus became the hostile and malevolent watcher and persecutor. As such she could have been overcome, had it not been that the mother-complex retained power enough to carry out its purpose of keeping the patient at a distance from men. Thus, at the end of the first phase of the conflict the patient had become estranged from her mother without having definitely gone over to the man. Indeed, both of them were plotting against her. Then the man's vigorous efforts succeeded in drawing her decisively to him. She conquered her mother's opposition in her mind and was willing to grant her lover a second meeting. In the later developments the mother did not reappear, but we may safely insist that in this phase the lover had not become the persecutor directly but *via* the mother and in virtue of his relationship to the mother, who had played the leading part in the first delusion.

One would think that the resistance was now definitely overcome, that the girl who until now had been bound to her mother had succeeded in coming to love a man. But after the second visit a new delusion appeared, which, by making ingenious use of some accidental circumstances, destroyed this love and thus successfully carried through the purpose of the mother-complex. It still seems strange that a woman should protect herself against loving a man by means of a paranoid delusion; but before examining this state of things more closely, let us glance at the accidental circumstances that formed the basis of this second delusion, the one aimed exclusively against the man.

Lying partly undressed on the sofa beside her lover, she heard a noise like a click or beat. She did not know its cause, but she arrived at an interpretation of it after meeting two men on the staircase, one of whom was carrying something that looked like a covered box. She became convinced that someone acting on instructions from her lover had watched and photographed her during their intimate *tête à tête*. I do not for a moment imagine, of course, that if the unlucky noise had not occurred the delusion would not have been formed; on the contrary, something inevitable is to be seen behind this accidental circumstance, something which was bound to assert itself compulsively in the patient, just as when she supposed that there was a *liason* between her lover and the elderly superior, her mother-substitute. Among the store of unconscious phantasies of all neurotics, and probably of all human beings, there is one which is seldom absent and which can be disclosed by analysis: this is the fantasy of watching sexual intercourse between the parents. I call such phantasies - of the observation of sexual intercourse between the parents, of seduction, of castration, and others - 'primal phantasies'; and I shall discuss in detail elsewhere their origin and their relation to individual experience. The accidental noise was thus merely playing the part of a provoking factor which activated the typical fantasy of overhearing which is a component of the parental complex. Indeed, it is doubtful whether we can rightly call the noise 'accidental'. As Otto Rank has remarked to me, such noises are on the contrary an indispensable part of the fantasy of listening, and they reproduce either the sounds which betray parental intercourse or those by which the listening child fears to betray itself. But now we know at once where we stand. The patient's lover was still her father, but she herself had taken her mother's place. The part of the listener had then to be allotted to a third person. We can see by what means the girl had freed herself from her homosexual dependence on her mother. It was by means of a small piece of regression: instead of choosing her mother as a love-object, she identified herself with her - she herself *became* her mother. The possibility of this regression points to the narcissistic origin of her homosexual object-choice and thus to the paranoid disposition in her. One might sketch a train of thought which would bring about the same result as this identification: 'If my mother does it, I may do it too; I've just as good a right as she has.'

One can go a step further in disproving the accidental nature of the noise. We do not, however, ask our readers to follow us, since the absence of any deeper analytic investigation makes it impossible in this case to go beyond a certain degree of probability. The patient mentioned in her first interview with me that she had immediately demanded an explanation of the noise, and had been told that it was probably the ticking of the small clock on the writing-desk. I venture, however, to explain what she told me as a mistaken memory. It seems to me much more likely that at first she did not react to the noise at all, and that it became significant only after she met the two men on the staircase. Her lover, who had probably not even heard the noise, may have tried, perhaps on some later occasion when she assailed him with her suspicions, to account for it in this way: 'I don't know what noise you can have heard. Perhaps it was the small clock; it sometimes ticks like that.' This deferred use of impressions and this displacement of recollections often occur precisely in paranoia and are characteristic of it. But as I never met the man and could not continue the analysis of the woman, my hypothesis cannot be proved.

I might go still further in the analysis of this ostensibly real 'accident'. I do not believe that the clock ever ticked or that there was any noise to be heard at all. The woman's situation justified a sensation of a knock or beat in her clitoris. And it was this that she subsequently projected as a perception of an external object. Just the same sort of thing can occur in dreams. A hysterical woman patient of mine once related to me a short arousal dream to which she could bring no spontaneous associations. She dreamt simply that someone knocked and then she awoke. Nobody had knocked at the door, but during the previous nights she had been awakened by distressing sensations of pollutions: she thus had a motive for awakening as soon as she felt the first sign of genital excitation. There had been a 'knock' in her clitoris. In the case of our paranoid patient, I should substitute for the accidental noise a similar process of projection. I certainly cannot guarantee that in the course of our short acquaintance the patient, who was reluctantly yielding to compulsion, gave me a truthful account of all that had taken place during the two meetings of the lovers. But an isolated contraction of the clitoris would be in keeping with her statement that no contact of the genitals had taken place. In her subsequent rejection of the man, lack of satisfaction undoubtedly played a part as well as 'conscience'.

Let us consider again the outstanding fact that the patient protected herself against her love for a man by means of a paranoid delusion. The key to the understanding of this is to be found in the history of the development of the delusion. As we might have expected, the latter was at first aimed against the woman. But now, *on this paranoid basis, the advance from a female to a male object was accomplished*. Such an advance is unusual in paranoia; as a rule we find that the victim of persecution remains fixated to the same persons, and therefore to the same sex to which his love-objects belonged before the paranoid transformation took place. But neurotic disorder does not preclude an advance of this kind, and our observation may be typical of many others. There are many similar processes occurring outside paranoia which have not yet been looked at from this point of view, amongst them some which are very familiar. For instance, the so-called neurasthenic's unconscious attachment to incestuous love-objects prevents him from choosing a strange woman as his object and restricts his sexual activity to phantasy. But within the limits of phantasy he achieves the progress which is denied him, and he succeeds in replacing mother and sister by extraneous objects. Since the veto of the censorship does not come into action with these objects, he can become conscious in his phantasies of his choice of these substitute-figures.

These then are phenomena of an attempted advance from the new ground which has as a rule been regressively acquired; and we may set alongside them the efforts made in some neuroses to regain a position of the libido which was once held and subsequently lost. Indeed we can hardly draw any conceptual distinction between these two classes of phenomena. We are too apt to think that the conflict underlying a neurosis is brought to an end when the symptom has been formed. In reality the struggle can go on in many ways after this. Fresh instinctual components arise on both sides, and these prolong it. The symptom itself becomes an object of this struggle; certain trends anxious to preserve it conflict with others which strive to remove it and to re-establish the *status quo ante*. Methods are often sought of rendering the symptom nugatory by trying to regain along other lines of approach what has been lost and is now withheld by the symptom. These facts throw much light on a statement made by C. G. Jung to the effect that a peculiar 'psychical inertia', which opposes change and progress, is the fundamental precondition of neurosis. This inertia is indeed most peculiar; it is not a general one, but is highly specialized; it is not even all-powerful within its own field, but fights against tendencies towards progress and recovery which remain active even after the formation of neurotic symptoms. If we search for the starting-point of this special inertia, we discover that it is the manifestation of very early linkages - linkages which it is hard to resolve - between instincts and impressions and the objects involved in those impressions. These linkages have the effect of bringing the development of the instincts concerned to a standstill. Or in other words, this specialized 'psychical inertia' is only a different term, though hardly a better one, for what in psycho-analysis we are accustomed to call a 'fixation'.

THOUGHTS FOR THE TIMES ON WAR AND DEATH

I

THE DISILLUSIONMENT OF THE WAR

In the confusion of wartime in which we are caught up, relying as we must on one-sided information, standing too close to the great changes that have already taken place or are beginning to, and without a glimmering of the future that is being shaped, we ourselves are at a loss as to the significance of the impressions which press in upon us and as to the value of the judgements which we form. We cannot but feel that no event has ever destroyed so much that is precious in the common possessions of humanity, confused so many of the clearest intelligences, or so thoroughly debased what is highest. Science herself has lost her passionless impartiality; her deeply embittered servants seek for weapons from her with which to contribute towards the struggle with the enemy. Anthropologists feel driven to declare him inferior and degenerate, psychiatrists issue a diagnosis of his disease of mind or spirit. Probably, however, our sense of these immediate evils is disproportionately strong, and we are not entitled to compare them with the evils of other times which we have not experienced.

The individual who is not himself a combatant - and so a cog in the gigantic machine of war - feels bewildered in his orientation, and inhibited in his powers and activities. I believe that he will welcome any indication, however slight, which will make it easier for him to find his bearings within himself at least. I propose to pick out two among the factors which are responsible for the mental distress felt by non-combatants, against which it is such a heavy task to struggle, and to treat of them here: the disillusionment which this war has evoked, and the altered attitude towards death which this - like every other war - forces upon us.

When I speak of disillusionment, everyone will know at once what I mean. One need not be a sentimentalist; one may perceive the biological and psychological necessity for suffering in the economy of human life, and yet condemn war both in its means and ends and long for the cessation of all wars. We have told ourselves, no doubt, that wars can never cease so long as nations live under such widely differing conditions, so long as the value of individual life is so variously assessed among them, and so long as the animosities which divide them represent such powerful motive forces in the mind. We were prepared to find that wars between the primitive and the civilized peoples, between the races who are divided by the colour of their skin - wars, even, against and among the nationalities of Europe whose civilization is little developed or has been lost - would occupy mankind for some time to come. But we permitted ourselves to have other hopes. We had expected the great world-dominating nations of white race upon whom the leadership of the human species has fallen, who were known to have world-wide interests as their concern, to whose creative powers were due not only our technical advances towards the control of nature but the artistic and scientific standards of civilization - we had expected these peoples to succeed in discovering another way of settling misunderstandings and conflicts of interest. Within each of these nations high norms of moral conduct were laid down for the individual, to which his manner of life was bound to conform if he desired to take part in a civilized community. These ordinances, often too stringent, demanded a great deal of him - much self-restraint, much renunciation of instinctual satisfaction. He was above all forbidden to make use of the immense advantages to be gained by the practice of lying and deception in the competition with his fellow-men. The civilized states regarded these moral standards as the basis of their existence. They took serious steps if anyone ventured to tamper with them, and often declared it improper even to subject them to examination by a critical intelligence. It was to be assumed, therefore, that the state itself would respect them, and would not think of undertaking anything against them which would contradict the basis of its own existence. Observation showed, to be sure, that embedded in these civilized states there were remnants of certain other peoples, which were universally unpopular and had therefore been only reluctantly, and even so not fully, admitted to participation in the common work of civilization, for which they had shown themselves suitable enough. But the great nations themselves, it might have been supposed, would have acquired so much comprehension of what they had in common, and so much tolerance for their differences, that 'foreigner' and 'enemy' could no longer be merged, as they still were in classical antiquity, into a single concept.

Relying on this unity among the civilized peoples, countless men and women have exchanged their native home for a foreign one, and made their existence dependent on the intercommunications between friendly nations. Moreover anyone who was not by stress of circumstance confined to one spot could create for himself out of all the advantages and attractions of these civilized countries a new and wider fatherland, in which he could move about without hindrance or suspicion. In this way he enjoyed the blue sea and the grey; the beauty of snow covered mountains and of green meadow lands; the magic of northern forests and the splendour of southern vegetation; the mood evoked by landscapes that recall great historical events, and the silence of untouched nature. This new fatherland was a museum for him, too, filled with all the treasures which the artists of civilized humanity had in the successive centuries created and left behind. As he wandered from one gallery to another in this museum, he could recognize with impartial appreciation what varied types of perfection a mixture of blood, the course of history, and the special quality of their mother earth had produced among his compatriots in this wider sense. Here he would find cool, inflexible energy developed to the highest point; there, the graceful art of beautifying existence; elsewhere, the feeling for orderliness and law, or others among the qualities which have made mankind the lords of the earth.

Nor must we forget that each of these citizens of the civilized world had created for himself a 'Parnassus' and a 'School of Athens' of his own. From among the great thinkers, writers and artists of all nations he had chosen those to whom he considered he owed the best of what he had been able to achieve in enjoyment and understanding of life, and he had venerated them along with the immortal ancients as well as with the familiar masters of his own tongue. None of these great men had seemed to him foreign because they spoke another language - neither the incomparable explorer of human passions, nor the intoxicated worshipper of beauty, nor the powerful and menacing prophet, nor the subtle satirist; and he never reproached himself on that account for being a renegade towards his own nation and his beloved mother-tongue.

The enjoyment of this common civilization was disturbed from time to time by warning voices, which declared that old traditional differences made wars inevitable, even among the members of a community such as this. We refused to believe it; but if such a war were to happen, how did we picture it? We saw it as an opportunity for demonstrating the progress of comity among men since the era when the Greek Amphictyonic Council proclaimed that no city of the league might be destroyed, nor its olive-groves cut down, nor its water-supply stopped; we pictured it as a chivalrous passage of arms, which would limit itself to establishing the superiority of one side in the struggle, while as far as possible avoiding acute suffering that could contribute nothing to the decision, and granting complete immunity for the wounded who had to withdraw from the contest, as well as for the doctors and nurses who devoted themselves to their recovery. There would, of course, be the utmost consideration for the non-combatant classes of the population - for women who take no part in war-work, and for the children who, when they are grown up, should become on both sides one another's friends and helpers. And again, all the international undertakings and institutions in which the common civilization of peace-time had been embodied would be maintained.

Even a war like this would have produced enough horror and suffering; but it would not have interrupted the development of ethical relations between the collective individuals of mankind the peoples and states.

Then the war in which we had refused to believe broke out, and it brought - disillusionment. Not only is it more bloody and more destructive than any war of other days, because of the enormously increased perfection of weapons of attack and defence; it is at least as cruel, as embittered, as implacable as any that has preceded it. It disregards all the restrictions known as International Law, which in peace-time the states had bound themselves to observe; it ignores the prerogatives of the wounded and the medical service, the distinction between civil and military sections of the population, the claims of private property. It tramples in blind fury on all that comes in its way, as though there were to be no future and no peace among men after it is over. It cuts all the common bonds between the contending peoples, and threatens to leave a legacy of embitterment that will make any renewal of those bonds impossible for a long time to come.

Moreover, it has brought to light an almost incredible phenomenon: the civilized nations know and understand one another so little that one can turn against the other with hate and loathing. Indeed, one of the great civilized nations is so universally unpopular that the attempt can actually be made to exclude it from the civilized community as 'barbaric', although it has long proved its fitness by the magnificent contributions to that community which it has made. We live in hopes that the pages of an impartial history will prove that that nation, in whose language we write and for whose victory our dear ones are fighting, has been precisely the one which has least transgressed the laws of civilization. But at such a time who dares to set himself up as judge in his own cause?

Peoples are more or less represented by the states which they form, and these states by the governments which rule them. The individual citizen can with horror convince himself in this war of what would occasionally cross his mind in peace-time - that the state has forbidden to the individual the practice of wrong doing, not because it desires to abolish it, but because it desires to monopolize it, like salt and tobacco. A belligerent state permits itself every such misdeed, every such act of violence, as would disgrace the individual. It makes use against the enemy not only of the accepted *ruses de guerre*, but of deliberate lying and deception as well - and to a degree which seems to exceed the usage of former wars. The state exacts the utmost degree of obedience and sacrifice from its citizens, but at the same time it treats them like children by an excess of secrecy and a censorship upon news and expressions of opinion which leaves the spirits of those whose intellects it thus suppresses defenceless against every unfavourable turn of events and every sinister rumour. It absolves itself from the guarantees and treaties by which it was bound to other states, and confesses shamelessly to its own rapacity and lust for power, which the private individual has then to sanction in the name of patriotism.

It should not be objected that the state cannot refrain from wrong-doing, since that would place it at a disadvantage. It is no less disadvantageous, as a general rule, for the individual man to conform to the standards of morality and refrain from brutal and arbitrary conduct; and the state seldom proves able to indemnify him for the sacrifices it exacts. Nor should it be a matter for surprise that this relaxation of all the moral ties between the collective individuals of mankind should have had repercussions on the morality of individuals; for our conscience is not the inflexible judge that ethical teachers declare it, but in its origin is 'social anxiety' and nothing else. When the community no longer raises objections, there is an end, too, to the suppression of evil passions, and men perpetrate deeds of cruelty, fraud, treachery and barbarity so incompatible with their level of civilization that one would have thought them impossible.

Well may the citizen of the civilized world of whom I have spoken stand helpless in a world that has grown strange to him - his great fatherland disintegrated, its common estates laid waste, his fellow-citizens divided and debased!

There is something to be said, however, in criticism of his disappointment. Strictly speaking it is not justified, for it consists in the destruction of an illusion. We welcome illusions because they spare us unpleasurable feelings, and enable us to enjoy satisfactions instead. We must not complain, then, if now and again they come into collision with some portion of reality, and are shattered against it.

Two things in this war have aroused our sense of disillusionment: the low morality shown externally by states which in their internal relations pose as the guardians of moral standards, and the brutality shown by individuals whom, as participants in the highest human civilization, one would not have thought capable of such behaviour.

Let us begin with the second point and try to formulate, in a few brief words, the point of view that we wish to criticize. How, in point of fact, do we imagine the process by which an individual rises to a comparatively high plane of morality? The first answer will no doubt simply be that he is virtuous and noble from birth - from the very start. We shall not consider this view any further here. A second answer will suggest that we are concerned with a developmental process, and will probably assume that the development consists in eradicating his evil human tendencies and, under the influence of education and a civilized environment, replacing them by good ones. If so, it is nevertheless surprising that evil should re-emerge with such force in anyone who has been brought up in this way.

But this answer also contains the thesis which we propose to contradict. In reality, there is no such thing as 'eradicating' evil. Psychological - or, more strictly speaking, psycho-analytic - investigation shows instead that the deepest essence of human nature consists of instinctual impulses which are of an elementary nature, which are similar in all men and which aim at the satisfaction of certain primal needs. These impulses in themselves are neither good nor bad. We classify them and their expressions in that way, according to their relation to the needs and demands of the human community. It must be granted that all the impulses which society condemns as evil - let us take as representative the selfish and the cruel ones - are of this primitive kind.

These primitive impulses undergo a lengthy process of development before they are allowed to become active in the adult. They are inhibited, directed towards other aims and fields, become commingled, alter their objects, and are to some extent turned back upon their possessor. Reaction-formations against certain instincts take the deceptive form of a change in their content, as though egoism had changed into altruism, or cruelty into pity. These reaction-formations are facilitated by the circumstance that some instinctual impulses make their appearance almost from the first in pairs of opposites - a very remarkable phenomenon, and one strange to the lay public, which is termed 'ambivalence of feeling'. The most easily observed and comprehensible instance of this is the fact that intense love and intense hatred are so often to be found together in the same person. Psycho-analysis adds that the two opposed feelings not infrequently have the same person for their object.

It is not until all these 'instinctual vicissitudes' have been surmounted that what we call a person's character is formed, and this, as we know, can only very inadequately be classified as 'good' or 'bad'. A human being is seldom altogether good or bad; he is usually 'good' in one relation and 'bad' in another, or 'good' in certain external circumstances and in others decidedly 'bad'. It is interesting to find that the pre-existence of strong 'bad' impulses in infancy is often the actual condition for an unmistakable inclination towards 'good' in the adult. Those who as children have been the most pronounced egoists may well become the most helpful and self-sacrificing members of the community; most of our sentimentalists, friends of humanity and protectors of animals have been evolved from little sadists and animal-tormentors.

The transformation of 'bad' instincts is brought about by two factors working in the same direction, an internal and an external one. The internal factor consists in the influence exercised on the bad (let us say, the egoistic) instincts by erotism - that is, by the human need for love, taken in its widest sense. By the admixture of *erotic* components the egoistic instincts are transformed into *social* ones. We learn to value being loved as an advantage for which we are willing to sacrifice other advantages. The external factor is the force exercised by upbringing, which represents the claims of our cultural environment, and this is continued later by the direct pressure of that environment. Civilization has been attained through the renunciation of instinctual satisfaction, and it demands the same renunciation from each newcomer in turn. Throughout an individual's life there is a constant replacement of external by internal compulsion. The influences of civilization cause an ever-increasing transformation of egoistic trends into altruistic and social ones by an admixture of erotic elements. In the last resort it may be assumed that every internal compulsion which makes itself felt in the development of human beings was originally - that is, in the *history of mankind* - only an external one. Those who are born to-day bring with them as an inherited organization some degree of tendency (disposition) towards the transformation of egoistic into social instincts, and this disposition is easily stimulated into bringing about that result. A further portion of this instinctual transformation has to be accomplished during the life of the individual himself. So the human being is subject not only to the pressure of his immediate cultural environment, but also to the influence of the cultural history of his ancestors.

If we give the name of 'susceptibility to culture' to a man's personal capacity for the transformation of the egoistic impulses under the influence of erotism, we may further affirm that this susceptibility is made up of two parts, one innate and the other acquired in the course of life, and that the relation of the two to each other and to that portion of the instinctual life which remains untransformed is a very variable one.

Generally speaking, we are apt to attach too much importance to the innate part, and in addition to this we run the risk of over-estimating the total susceptibility to culture in comparison with the portion of instinctual life which has remained primitive - that is, we are misled into regarding men as 'better' than they actually are. For there is yet another element which obscures our judgement and falsifies the issue in a favourable sense.

The instinctual impulses of other people are of course hidden from our observation. We infer them from their actions and behaviour, which we trace back to *motives* arising from their instinctual life. Such an inference is bound to be erroneous in many cases. This or that action which is 'good' from the cultural point of view may in one instance originate from a 'noble' motive, in another not. Ethical theorists class as 'good' actions only those which are the outcome of good impulses; to the others they refuse recognition. But society, which is practical in its aims, is not on the whole troubled by this distinction; it is content if a man regulates his behaviour and actions by the precepts of civilization, and is little concerned with his motives.

We have learned that the *external compulsion* exercised on a human being by his upbringing and environment produces a further transformation towards good in his instinctual life - a further turning from egoism towards altruism. But this is not the regular or necessary effect of the external compulsion. Upbringing and environment not only offer benefits in the way of love, but also employ other kinds of incentive, namely, rewards and punishments. In this way their effect may turn out to be that a person who is subjected to their influence will choose to behave well in the cultural sense of the phrase, although no ennoblement of instinct, no transformation of egoistic into altruistic inclinations, has taken place in him. The result will, roughly speaking, be the same; only a particular concatenation of circumstances will reveal that one man always acts in a good way because his instinctual inclinations compel him to, and the other is good only in so far and for so long as such cultural behaviour is advantageous for his own selfish purposes. But superficial acquaintance with an individual will not enable us to distinguish between the two cases, and we are certainly misled by our optimism into grossly exaggerating the number of human beings who have been transformed in a cultural sense.

Civilized society, which demands good conduct and does not trouble itself about the instinctual basis of this conduct, has thus won over to obedience a great many people who are not in this following their own natures. Encouraged by this success, society has allowed itself to be misled into tightening the moral standard to the greatest possible degree, and it has thus forced its members into a yet greater estrangement from their instinctual disposition. They are consequently subject to an unceasing suppression of instinct, and the resulting tension betrays itself in the most remarkable phenomena of reaction and compensation. In the domain of sexuality, where such suppression is most difficult to carry out, the result is seen in the reactive phenomena of neurotic disorders. Elsewhere the pressure of civilization brings in its train no pathological results, it is true, but is shown in malformations of character, and in the perpetual readiness of the inhibited instincts to break through to satisfaction at any suitable opportunity. Anyone thus compelled to act continually in accordance with precepts which are not the expression of his instinctual inclinations, is living, psychologically speaking, beyond his means, and may objectively be described as a hypocrite, whether he is clearly aware of the incongruity or not. It is undeniable that our contemporary civilization favours the production of this form of hypocrisy to an extraordinary extent. One might venture to say that it is built up on such hypocrisy, and that it would have to submit to far-reaching modifications if people were to undertake to live in accordance with psychological truth. Thus there are very many more cultural hypocrites than truly civilized men - indeed, it is a debatable point whether a certain degree of cultural hypocrisy is not indispensable for the maintenance of civilization, because the susceptibility to culture which has hitherto been organized in the minds of present-day men would perhaps not prove sufficient for the task. On the other hand, the maintenance of civilization even on so dubious a basis offers the prospect of paving the way in each new generation for a more far-reaching transformation of instinct which shall be the vehicle of a better civilization.

We may already derive one consolation from this discussion: our mortification and our painful disillusionment on account of the uncivilized behaviour of our fellow-citizens of the world during this war were unjustified. They were based on an illusion to which we had given way. In reality our fellow-citizens have not sunk so low as we feared, because they had never risen so high as we believed. The fact that the collective individuals of mankind, the peoples and states, mutually abrogated their moral restraints naturally prompted these individual citizens to withdraw for a while from the constant pressure of civilization and to grant a temporary satisfaction to the instincts which they had been holding in check. This probably involved no breach in their relative morality within their own nations.

We may, however, obtain a deeper insight than this into the change brought about by the war in our former compatriots, and at the same time receive a warning against doing them an injustice. For the development of the mind shows a peculiarity which is present in no other developmental process. When a village grows into a town or a child into a man, the village and the child become lost in the town and the man. Memory alone can trace the old features in the new picture; and in fact the old materials or forms have been got rid of and replaced by new ones. It is otherwise with the development of the mind. Here one can describe the state of affairs, which has nothing to compare with it, only by saying that in this case every earlier stage of development persists alongside the later stage which has arisen from it; here succession also involves co-existence, although it is to the same materials that the whole series of transformations has applied. The earlier mental state may not have manifested itself for years, but none the less it is so far present that it may at any time again become the mode of expression of the forces in the mind, and indeed the only one, as though all later developments had been annulled or undone. This extraordinary plasticity of mental developments is not unrestricted as regards direction; it may be described as a special capacity for involution - for regression - since it may well happen that a later and higher stage of development, once abandoned, cannot be reached again. But the primitive stages can always be re-established; the primitive mind is, in the fullest meaning of the word, imperishable.

What are called mental diseases inevitably produce an impression in the layman that intellectual and mental life have been destroyed. In reality, the destruction only applies to later acquisitions and developments. The essence of mental disease lies in a return to earlier states of affective life and of functioning. An excellent example of the plasticity of mental life is afforded by the state of sleep, which is our goal every night. Since we have learnt to interpret even absurd and confused dreams, we know that whenever we go to sleep we throw off our hard-won morality like a garment, and put it on again next morning. This stripping of ourselves is not, of course, dangerous, because we are paralysed, condemned to inactivity, by the state of sleep. It is only dreams that can tell us about the regression of our emotional life to one of the earliest stages of development. For instance, it is noteworthy that all our dreams are governed by purely egoistic motives. One of my English friends put forward this thesis at a scientific meeting in America, whereupon a lady who was present remarked that that might be the case in Austria, but she could assert as regards herself and her friends that *they* were altruistic even in their dreams. My friend, although himself of English race, was obliged to contradict the lady emphatically on the ground of his personal experience in dream-analysis, and to declare that in their dreams high-minded American ladies were quite as egoistic as the Austrians.

Thus the transformation of instinct, on which our susceptibility to culture is based, may also be permanently or temporarily undone by the impacts of life. The influences of war are undoubtedly among the forces that can bring about such involution; so we need not deny susceptibility to culture to all who are at the present time behaving in an uncivilized way, and we may anticipate that the ennoblement of their instincts will be restored in more peaceful times.

There is, however, another symptom in our fellow-citizens of the world which has perhaps astonished and shocked us no less than the descent from their ethical heights which has given us so much pain. What I have in mind is the want of insight shown by the best intellects, their obduracy, their inaccessibility to the most forcible arguments and their uncritical credulity towards the most disputable assertions. This indeed presents a lamentable picture, and I wish to say emphatically that in this I am by no means a blind partisan who finds all the intellectual shortcomings on one side. But this phenomenon is much easier to account for and much less disquieting than the one we have just considered. Students of human nature and philosophers have long taught us that we are mistaken in regarding our intelligence as an independent force and in overlooking its dependence on emotional life. Our intellect, they teach us, can function reliably only when it is removed from the influences of strong emotional impulses; otherwise it behaves merely as an instrument of the will and delivers the inference which the will requires. Thus, in their view, logical arguments are impotent against affective interests, and that is why disputes backed by reasons, which in Falstaff's phrase are 'as plenty as blackberries', are so unfruitful in the world of interests. Psycho-analytic experience has, if possible, further confirmed this statement. It can show every day that the shrewdest people will all of a sudden behave without insight, like imbeciles, as soon as the necessary insight is confronted by an emotional resistance, but that they will completely regain their understanding once that resistance has been overcome. The logical bedazzlement which this war has conjured up in our fellow-citizens, many of them the best of their kind, is therefore a secondary phenomenon, a consequence of emotional excitement, and is bound, we may hope, to disappear with it.

Having in this way once more come to understand our fellow citizens who are now alienated from us, we shall much more easily endure the disappointment which the nations, the collective individuals of mankind, have caused us, for the demands we make upon these should be far more modest. Perhaps they are recapitulating the course of individual development, and to-day still represent very primitive phases in organization and in the formation of higher unities. It is in agreement with this that the educative factor of an external compulsion towards morality, which we found was so effective in individuals, is as yet barely discernible in them. We had hoped, certainly, that the extensive community of interests established by commerce and production would constitute the germ of such a compulsion, but it would seem that nations still obey their passions far more readily than their interests. Their interests serve them, at most, as *rationalizations* for their passions; they put forward their interests in order to be able to give reasons for satisfying their passions. It is, to be sure, a mystery why the collective individuals should in fact despise, hate and detest one another - every nation against every other - and even in times of peace. I cannot tell why that is so. It is just as though when it becomes a question of a number of people, not to say millions, all individual moral acquisitions are obliterated, and only the most primitive, the oldest, the crudest mental attitudes are left. It may be that only later stages in development will be able to make some change in this regrettable state of affairs. But a little more truthfulness and honesty on all sides - in the relations of men to one another and between them and their rulers - should also smooth the way for this transformation.

II

OUR ATTITUDE TOWARDS DEATH

The second factor to which I attribute our present sense of estrangement in this once lovely and congenial world is the disturbance that has taken place in the attitude which we have hitherto adopted towards death.

That attitude was far from straightforward. To anyone who listened to us we were of course prepared to maintain that death was the necessary outcome of life, that everyone owes nature a death and must expect to pay the debt - in short, that death was natural, undeniable and unavoidable. In reality, however, we were accustomed to behave as if it were otherwise. We showed an unmistakable tendency to put death on one side, to eliminate it from life. We tried to hush it up; indeed we even have a saying [in German]: 'to think of something as though it were death'. That is, as though it were our own death, of course. It is indeed impossible to imagine our own death; and whenever we attempt to do so we can perceive that we are in fact still present as spectators. Hence the psycho-analytic school could venture on the assertion that at bottom no one believes in his own death, or, to put the same thing in another way, that in the unconscious every one of us is convinced of his own immortality.

When it comes to someone else's death, the civilized man will carefully avoid speaking of such a possibility in the hearing of the person under sentence. Children alone disregard this restriction; they unashamedly threaten one another with the possibility of dying, and even go so far as to do the same thing to someone whom they love, as, for instance: 'Dear Mummy, when you're dead I'll do this or that.' The civilized adult can hardly even entertain the thought of another person's death without seeming to himself hard-hearted or wicked; unless, of course, as a doctor or lawyer or something of the kind, he has to deal with death professionally. Least of all will he allow himself to think of the other person's death if some gain to himself in freedom, property or position is bound up with it. This sensitiveness of ours does not, of course, prevent the occurrence of deaths; when one does happen, we are always deeply affected, and it is as though we were badly shaken in our expectations. Our habit is to lay stress on the fortuitous causation of the death - accident, disease, infection, advanced age; in this way we betray an effort to reduce death from a necessity to a chance event. A number of simultaneous deaths strikes us as something extremely terrible. Towards the actual person who has died we adopt a special attitude - something almost like admiration for someone who has accomplished a very difficult task. We suspend criticism of him, overlook his possible misdeeds, declare that '*de mortuis nil nisi bonum*', and think it justifiable to set out all that is most favourable to his memory in the funeral oration and upon the tombstone. Consideration for the dead, who, after all, no longer need it, is more important to us than the truth, and certainly, for most of us, than consideration for the living.

The complement to this cultural and conventional attitude towards death is provided by our complete collapse when death has struck down someone whom we love - a parent or a partner in marriage, a brother or sister, a child or a close friend. Our hopes, our desires and our pleasures lie in the grave with him, we will not be consoled, we will not fill the lost one's place. We behave as if we were a kind of Asra, who die when those they love die.

But this attitude of ours towards death has a powerful effect on our lives. Life is impoverished, it loses in interest, where the highest stake in the game of living, life itself, may not be risked. It becomes as shallow and empty as, let us say, an American flirtation, in which it is understood from the first that nothing is to happen, as contrasted with a Continental love-affair in which both partners must constantly bear its serious consequences in mind. Our emotional ties, the unbearable intensity of our grief, make us disinclined to court danger for ourselves and for those who belong to us. We dare not contemplate a great many undertakings which are dangerous but in fact indispensable, such as attempts at artificial flight, expeditions to distant countries or experiments with explosive substances. We are paralysed by the thought of who is to take the son's place with his mother, the husband's with his wife, the father's with his children, if a disaster should occur. Thus the tendency to exclude death from our calculations in life brings in its train many other renunciations and exclusions. Yet the motto of the Hanseatic League ran: '*Navigare necesse est, vivere non necesse.*' ('It is necessary to sail the seas, it is not necessary to live.')

It is an inevitable result of all this that we should seek in the world of fiction, in literature and in the theatre compensation for what has been lost in life. There we still find people who know how to die - who, indeed, even manage to kill someone else. There alone too the condition can be fulfilled which makes it possible for us to reconcile ourselves with death: namely, that behind all the vicissitudes of life we should still be able to preserve a life intact. For it is really too sad that in life it should be as it is in chess, where one false move may force us to resign the game, but with the difference that we can start no second game, no return-match. In the realm of fiction we find the plurality of lives which we need. We die with the hero with whom we have identified ourselves; yet we survive him, and are ready to die again just as safely with another hero.

It is evident that war is bound to sweep away this conventional treatment of death. Death will no longer be denied; we are forced to believe in it. People really die; and no longer one by one, but many, often tens of thousands, in a single day. And death is no longer a chance event. To be sure, it still seems a matter of chance whether a bullet hits this man or that; but a second bullet may well hit the survivor; and the accumulation of deaths puts an end to the impression of chance. Life has, indeed, become interesting again; it has recovered its full content.

Here a distinction should be made between two groups - those who themselves risk their lives in battle, and those who have stayed at home and have only to wait for the loss of one of their dear ones by wounds, disease or infection. It would be most interesting, no doubt, to study the changes in the psychology of the combatants, but I know too little about it. We must restrict ourselves to the second group, to which we ourselves belong. I have said already that in my opinion the bewilderment and the paralysis of capacity, from which we suffer, are essentially determined among other things by the circumstance that we are unable to maintain our former attitude towards death, and have not yet found a new one. It may assist us to do this if we direct our psychological enquiry towards two other relations to death - the one which we may ascribe to *primaeval*, prehistoric men, and the one which still exists in every one of us, but which conceals itself, invisible to consciousness, in the deeper strata of our mental life.

What the attitude of prehistoric man was towards death is, of course, only known to us by inferences and constructions, but I believe that these methods have furnished us with fairly trustworthy conclusions.

Primaeval man took up a very remarkable attitude towards death. It was far from consistent; it was indeed most contradictory. On the one hand, he took death seriously, recognized it as the termination of life and made use of it in that sense; on the other hand, he also denied death and reduced it to nothing. This contradiction arose from the fact that he took up radically different attitudes towards the death of other people, of strangers, of enemies, and towards his own. He had no objection to someone else's death; it meant the annihilation of someone he hated, and primitive man had no scruples against bringing it about. He was no doubt a very passionate creature and more cruel and more malignant than other animals. He liked to kill, and killed as a matter of course. The instinct which is said to restrain other animals from killing and devouring their own species need not be attributed to him.

Hence the primaeval history of mankind is filled with murder. Even to-day, the history of the world which our children learn at school is essentially a series of murders of peoples. The obscure sense of guilt to which mankind has been subject since prehistoric times, and which in some religions has been condensed into the doctrine of primal guilt, of original sin, is probably the outcome of a blood-guilt incurred by prehistoric man. In my book *Totem and Taboo* (1912-13) I have, following clues given by Robertson Smith, Atkinson and Charles Darwin, tried to guess the nature of this primal guilt, and I believe, too, that the Christian doctrine of to-day enables us to deduce it. If the Son of God was obliged to sacrifice his life to redeem mankind from original sin, then by the law of talion, the requital of like by like, that sin must have been a killing, a murder. Nothing else could call for the sacrifice of a life for its expiation. And the original sin was an offence against God the Father, the primal crime of mankind must have been a parricide, the killing of the primal father of the primitive human horde, whose mnemonic image was later transfigured into a deity.¹

¹ Cf. *Totem and Taboo*, Essay IV.

His own death was certainly just as unimaginable and unreal for *primaeval* man as it is for any one of us to-day. But there was for him one case in which the two opposite attitudes towards death collided and came into conflict with each other; and this case became highly important and productive of far-reaching consequences. It occurred when *primaeval* man saw someone who belonged to him die - his wife, his child, his friend - whom he undoubtedly loved as we love ours, for love cannot be much younger than the lust to kill. Then, in his pain, he was forced to learn that one can die, too, oneself, and his whole being revolted against the admission; for each of these loved ones was, after all, a part of his own beloved ego. But, on the other hand, deaths such as these pleased him as well, since in each of the loved persons there was also something of the stranger. The law of ambivalence of feeling, which to this day governs our emotional relations with those whom we love most, certainly had a very much wider validity in *primaeval* times. Thus these beloved dead had also been enemies and strangers who had aroused in him some degree of hostile feeling.¹

Philosophers have declared that the intellectual enigma presented to *primaeval* man by the picture of death forced him to reflection, and thus became the starting-point of all speculation. I believe that here the philosophers are thinking too philosophically, and giving too little consideration to the motives that were primarily operative. I should like therefore to limit and correct their assertion. In my view, *primaeval* man must have triumphed beside the body of his slain enemy, without being led to rack his brains about the enigma of life and death. What released the spirit of enquiry in man was not the intellectual enigma, and not every death, but the conflict of feeling at the death of loved yet alien and hated persons. Of this conflict of feeling psychology was the first offspring. Man could no longer keep death at a distance, for he had tasted it in his pain about the dead; but he was nevertheless unwilling to acknowledge it, for he could not conceive of himself as dead. So he devised a compromise: he conceded the fact of his own death as well, but denied it the significance of annihilation - a significance which he had had no motive for denying where the death of his enemy was concerned. It was beside the dead body of someone he loved that he invented spirits, and his sense of guilt at the satisfaction mingled with his sorrow turned these new-born spirits into evil demons that had to be dreaded. The changes brought about by death suggested to him the division of the individual into a body and a soul - originally several souls. In this way his train of thought ran parallel with the process of disintegration which sets in with death. His persisting memory of the dead became the basis for assuming other forms of existence and gave him the conception of a life continuing after apparent death.

¹ Ibid., Essay II.

These subsequent existences were at first no more than appendages to the existence which death had brought to a close - shadowy, empty of content, and valued at little until later times; they still bore the character of wretched makeshifts. We may recall the answer made to Odysseus by the soul of Achilles:

‘For of old, when thou wast alive, we Argives honoured thee even as the gods, and now that thou art here, thou rulest mightily over the dead. Wherefore grieve not at all that thou art dead, Achilles.’

So I spoke, and he straightway made answer and said: ‘Nay, seek not to speak soothingly to me of death, glorious Odysseus. I should choose, so I might live on earth, to serve as the hireling of another, of some portionless man whose livelihood was but small, rather than to be lord over all the dead that have perished.’¹

Or in Heine’s powerful and bitter parody:

Der kleinste lebendige Philister
Zu Stuckert am Neckar
Viel glücklicher ist er
Als ich, der Pelide, der tote Held,
Der Schattenfürst in der Unterwelt.²

¹ *Odyssey*, XI, 484-91.

² [Literally: ‘The smallest living Philistine at Stuckert-am-Neckar is far happier than I, the son of Peleus, the dead hero, the shadow-prince in the underworld.’]

It was only later that religions succeeded in representing this after-life as the more desirable, the truly valid one, and in reducing the life which is ended by death to a mere preparation. After this, it was no more than consistent to extend life backwards into the past, to form the notion of earlier existences, of the transmigration of souls and of reincarnation, all with the purpose of depriving death of its meaning as the termination of life. So early did the denial of death, which we have described as a 'conventional and cultural attitude', have its origin.

What came into existence beside the dead body of the loved one was not only the doctrine of the soul, the belief in immortality and a powerful source of man's sense of guilt, but also the earliest ethical commandments. The first and most important prohibition made by the awakening conscience was: 'Thou shalt not kill.' It was acquired in relation to dead people who were loved, as a reaction against the satisfaction of the hatred hidden behind the grief for them; and it was gradually extended to strangers who were not loved, and finally even to enemies.

This final extension of the commandment is no longer experienced by civilized man. When the furious struggle of the present war has been decided, each one of the victorious fighters will return home joyfully to his wife and children, unchecked and undisturbed by thoughts of the enemies he has killed whether at close quarters or at long range. It is worthy of note that the primitive races which still survive in the world, and are undoubtedly closer than we are to primaeval man, act differently in this respect, or did until they came under the influence of our civilization. Savages - Australians, Bushmen, Tierra del Fuegians - are far from being remorseless murderers; when they return victorious from the war-path they may not set foot in their villages or touch their wives till they have atoned for the murders they committed in war by penances which are often long and tedious. It is easy, of course, to attribute this to their superstition: the savage still goes in fear of the avenging spirits of the slain. But the spirits of his slain enemy are nothing but the expression of his bad conscience about his blood-guilt; behind this superstition there lies concealed a vein of ethical sensitiveness which has been lost by us civilized men.¹

¹ Cf. *Totem and Taboo* (1912-13).

Pious souls, no doubt, who would like to believe that our nature is remote from any contact with what is evil and base, will not fail to use the early appearance and the urgency of the prohibition against murder as the basis for gratifying conclusions as to the strength of the ethical impulses which must have been implanted in us. Unfortunately this argument proves even more for the opposite view. So powerful a prohibition can only be directed against an equally powerful impulse. What no human soul desires stands in no need of prohibition;¹ it is excluded automatically. The very emphasis laid on the commandment 'Thou shalt not kill' makes it certain that we spring from an endless series of generations of murderers, who had the lust for killing in their blood, as, perhaps, we ourselves have to-day. Mankind's ethical strivings, whose strength and significance we need not in the least depreciate, were acquired in the course of man's history; since then they have become, though unfortunately only in a very variable amount, the inherited property of contemporary men.

Let us now leave *primaeval* man, and turn to the unconscious in our own mental life. Here we depend entirely upon the psycho-analytic method of investigation, the only one which reaches to such depths. What, we ask, is the attitude of our unconscious towards the problem of death? The answer must be: almost exactly the same as that of *primaeval* man. In this respect, as in many others, the man of prehistoric times survives unchanged in our unconscious. Our unconscious, then, does not believe in its own death; it behaves as if it were immortal. What we call our 'unconscious' - the deepest strata of our minds, made up of instinctual impulses - knows nothing that is negative, and no negation; in its contradictories coincide. For that reason it does not know its own death, for to that we can give only a negative content. Thus there is nothing instinctual in us which responds to a belief in death. This may even be the secret of heroism. The rational grounds for heroism rest on a judgement that the subject's own life cannot be so precious as certain abstract and general goods. But more frequent, in my view, is the instinctive and impulsive heroism which knows no such reasons, and flouts danger in the spirit of Anzengruber's *Steinklopferhans*: 'Nothing can happen to *me*'. Or else those reasons only serve to clear away the hesitations which might hold back the heroic reaction that corresponds to the unconscious. The fear of death, which dominates us oftener than we know, is on the other hand something secondary, and is usually the outcome of a sense of guilt.

¹ Cf. Frazer's brilliant argument quoted in *Totem and Taboo*.

On the other hand, for strangers and for enemies we do acknowledge death, and consign them to it quite as readily and unhesitatingly as did *primaeval* man. There is, it is true, a distinction here which will be pronounced decisive so far as real life is concerned. Our unconscious does not carry out the killing; it merely thinks it and wishes it. But it would be wrong so completely to undervalue this psychical reality as compared with factual reality. It is significant and momentous enough. In our unconscious impulses we daily and hourly get rid of anyone who stands in our way, of anyone who has offended or injured us. The expression 'Devil take him!', which so often comes to people's lips in joking anger and which really means 'Death take him!', is in our unconscious a serious and powerful death-wish. Indeed, our unconscious will murder even for trifles; like the ancient Athenian code of Draco, it knows no other punishment for crime than death. And this has a certain consistency, for every injury to our almighty and autocratic ego is at bottom a crime of *lèse-majesté*.

And so, if we are to be judged by our unconscious wishful impulses, we ourselves are, like *primaeval* man, a gang of murderers. It is fortunate that all these wishes do not possess the potency that was attributed to them in *primaeval* times;¹ in the cross-fire of mutual curses mankind would long since have perished, the best and wisest of men and the loveliest and fairest of women with the rest.

¹ See *Totem and Taboo*, Essay IV.

Psycho-analysis finds as a rule no credence among laymen for assertions such as these. They reject them as calumnies which are confuted by conscious experience, and they adroitly overlook the faint indications by which even the unconscious is apt to betray itself to consciousness. It is therefore relevant to point out that many thinkers who could not have been influenced by psycho-analysis have quite definitely accused our unspoken thoughts of being ready, heedless of the prohibition against murder, to get rid of anything which stands in our way. From many examples of this I will choose one that has become famous:

In *Le Père Goriot*, Balzac alludes to a passage in the works of J. J. Rousseau where that author asks the reader what he would do if - without leaving Paris and of course without being discovered - he could kill, with great profit to himself, an old mandarin in Peking by a mere act of will. Rousseau implies that he would not give much for the life of that dignitary. '*Tuer son mandarin*' has become a proverbial phrase for this secret readiness, present even in modern man.

There are also a whole number of cynical jokes and anecdotes which reveal the same tendency - such, for instance, as the words attributed to a husband: 'If one of us two dies, I shall move to Paris.' Such cynical jokes would not be possible unless they contained an unacknowledged truth which could not be admitted if it were expressed seriously and without disguise. In jest - it is well known - one may even tell the truth.

Just as for *primaeval* man, so also for our unconscious, there is one case in which the two opposing attitudes towards death, the one which acknowledges it as the annihilation of life and the other which denies it as unreal, collide and come into conflict. This case is the same as in primal ages: the death, or the risk of death, of someone we love, a parent or a partner in marriage, a brother or sister, a child or a dear friend. These loved ones are on the one hand an inner possession, components of our own ego; but on the other hand they are partly strangers, even enemies. With the exception of only a very few situations, there adheres to the tenderest and most intimate of our love-relations a small portion of hostility which can excite an unconscious death-wish. But this conflict due to ambivalence does not now, as it did then, lead to the doctrine of the soul and to ethics, but to neurosis, which affords us deep insight into normal mental life as well. How often have physicians who practise psycho-analysis had to deal with the symptom of an exaggerated worry over the well-being of relatives, or with entirely unfounded self-reproaches after the death of a loved person. The study of such phenomena has left them in no doubt about the extent and importance of unconscious death-wishes.

The layman feels an extraordinary horror at the possibility of such feelings, and takes this aversion as a legitimate ground for disbelief in the assertions of psycho-analysis. Mistakenly, I think. No depreciation of feelings of love is intended, and there is in fact none. It is indeed foreign to our intelligence as well as to our feelings thus to couple love and hate; but Nature, by making use of this pair of opposites, contrives to keep love ever vigilant and fresh, so as to guard it against the hate which lurks behind it. It might be said that we owe the fairest flowerings of our love to the reaction against the hostile impulse which we sense within us.

To sum up: our unconscious is just as inaccessible to the idea of our own death, just as murderously inclined towards strangers, just as divided (that is, ambivalent) towards those we love, as was primaeval man. But how far we have moved from this primal state in our conventional and cultural attitude towards death!

It is easy to see how war impinges on this dichotomy. It strips us of the later accretions of civilization, and lays bare the primal man in each of us. It compels us once more to be heroes who cannot believe in their own death; it stamps strangers as enemies, whose death is to be brought about or desired; it tells us to disregard the death of those we love. But war cannot be abolished; so long as the conditions of existence among nations are so different and their mutual repulsion so violent, there are bound to be wars. The question then arises: Is it not we who should give in, who should adapt ourselves to war? Should we not confess that in our civilized attitude towards death we are once again living psychologically beyond our means, and should we not rather turn back and recognize the truth? Would it not be better to give death the place in reality and in our thoughts which is its due, and to give a little more prominence to the unconscious attitude towards death which we have hitherto so carefully suppressed? This hardly seems an advance to higher achievement, but rather in some respects a backward step - a regression; but it has the advantage of taking the truth more into account, and of making life more tolerable for us once again. To tolerate life remains, after all, the first duty of all living beings. Illusion becomes valueless if it makes this harder for us.

We recall the old saying: *Si vis pacem, para bellum*. If you want to preserve peace, arm for war.

It would be in keeping with the times to alter it: *Si vis vitam, para mortem*. If you want to endure life, prepare yourself for death.

APPENDIX

LETTER TO FREDERIK VAN EEDEN

Vienna, December 28, 1914.

Dear Dr. van Eeden,

I venture, under the impact of the war, to remind you of two theses which have been put forward by psycho-analysis and which have undoubtedly contributed to its unpopularity.

Psycho-analysis has inferred from the dreams and parapraxes of healthy people, as well as from the symptoms of neurotics, that the primitive, savage and evil impulses of mankind have not vanished in any of its individual members but persist, although in a repressed state, in the unconscious (to use our technical terms), and lie wait for opportunities of becoming active once more. It has further taught us that our intellect is a feeble and dependent thing, a plaything and tool of our instincts and affects, and that we are all compelled to behave cleverly or stupidly according to the commands of our attitudes and internal resistances.

If you will now observe what is happening in the war - the cruelties and injustices for which the most civilized nations are responsible, the different way in which they judge their own lies and wrong-doings and those of their enemies, and the general lack of insight which prevails - you will have to admit that psycho-analysis has been right in both its theses.

It may not have been entirely original in this; many thinkers and students of mankind have made similar assertions. But our science has worked out both of them in detail and has employed them to throw light on many psychological puzzles. I hope we shall meet again in happier times.

Yours very sincerely,
Sigm. Freud

ON TRANSCIENCE
(1916)

Intentionally left blank

ON TRANSIENCE

Not long ago I went on a summer walk through a smiling countryside in the company of a taciturn friend and of a young but already famous poet. The poet admired the beauty of the scene around us but felt no joy in it. He was disturbed by the thought that all this beauty was fated to extinction, that it would vanish when winter came, like all human beauty and all the beauty and splendour that men have created or may create. All that he would otherwise have loved and admired seemed to him to be shorn of its worth by the transience which was its doom.

The proneness to decay of all that is beautiful and perfect can, as we know, give rise to two different impulses in the mind. The one leads to the aching despondency felt by the young poet, while the other leads to rebellion against the fact asserted. No! it is impossible that all this loveliness of Nature and Art, of the world of our sensations and of the world outside, will really fade away into nothing. It would be too senseless and too presumptuous to believe it. Somehow or other this loveliness must be able to persist and to escape all the powers of destruction.

But this demand for immortality is a product of our wishes too unmistakable to lay claim to reality: what is painful may none the less be true. I could not see my way to dispute the transience of all things, nor could I insist upon an exception in favour of what is beautiful and perfect. But I did dispute the pessimistic poet's view that the transience of what is beautiful involves any loss in its worth.

On the contrary, an increase! Transience value is scarcity value in time. Limitation in the possibility of an enjoyment raises the value of the enjoyment. It was incomprehensible, I declared, that the thought of the transience of beauty should interfere with our joy in it. As regards the beauty of Nature, each time it is destroyed by winter it comes again next year, so that in relation to the length of our lives it can in fact be regarded as eternal. The beauty of the human form and face vanish for ever in the course of our own lives, but their evanescence only lends them a fresh charm. A flower that blossoms only for a single night does not seem to us on that account less lovely. Nor can I understand any better why the beauty and perfection of a work of art or of an intellectual achievement should lose its worth because of its temporal limitation. A time may indeed come when the pictures and statues which we admire to-day will crumble to dust, or a race of men may follow us who no longer understand the works of our poets and thinkers, or a geological epoch may even arrive when all animate life upon the earth ceases; but since the value of all this beauty and perfection is determined only by its significance for our own emotional lives, it has no need to survive us and is therefore independent of absolute duration.

These considerations appeared to me incontestable; but I noticed that I had made no impression either upon the poet or upon my friend. My failure led me to infer that some powerful emotional factor was at work which was disturbing their judgement, and I believed later that I had discovered what it was. What spoils their enjoyment of beauty must have been a revolt in their minds against mourning. The idea that all this beauty was transient was giving these two sensitive minds a foretaste of mourning over its decease; and, since the mind instinctively recoils from anything that is painful, they felt their enjoyment of beauty interfered with by thoughts of its transience.

Mourning over the loss of something that we have loved or admired seems so natural to the layman that he regards it as self-evident. But to psychologists mourning is a great riddle, one of those phenomena which cannot themselves be explained but to which other obscurities can be traced back. We possess, as it seems, a certain amount of capacity for love - what we call libido - which in the earliest stages of development is directed towards our own ego. Later, though still at a very early time, this libido is diverted from the ego on to objects, which are thus in a sense taken into our ego. If the objects are destroyed or if they are lost to us, our capacity for love (our libido) is once more liberated; and it can then either take other objects instead or can temporarily return to the ego. But why it is that this detachment of libido from its objects should be such a painful process is a mystery to us and we have not hitherto been able to frame any hypothesis to account for it. We only see that libido clings to its objects and will not renounce those that are lost even when a substitute lies ready to hand. Such then is mourning.

My conversation with the poet took place in the summer before the war. A year later the war broke out and robbed the world of its beauties. It destroyed not only the beauty of the countrysides through which it passed and the works of art which it met with on its path but it also shattered our pride in the achievements of our civilization, our admiration for many philosophers and artists and our hopes of a final triumph over the differences between nations and races. It tarnished the lofty impartiality of our science, it revealed our instincts in all their nakedness and let loose the evil spirits within us which we thought had been tamed for ever by centuries of continuous education by the noblest minds. It made our country small again and made the rest of the world far remote. It robbed us of very much that we had loved, and showed us how ephemeral were many things that we had regarded as changeless.

We cannot be surprised that our libido, thus bereft of so many of its objects, has clung with all the greater intensity to what is left to us, that our love of our country, our affection for those nearest us and our pride in what is common to us have suddenly grown stronger. But have those other possessions, which we have now lost, really ceased to have any worth for us because they have proved so perishable and so unresistant? To many of us this seems to be so, but once more wrongly, in my view. I believe that those who think thus, and seem ready to make a permanent renunciation because what was precious has proved not to be lasting, are simply in a state of mourning for what is Lost. Mourning, as we know, however painful it may become to a spontaneous end. When it has renounced everything that has been lost, then it has consumed itself, and our libido is once more free (in so far as we are still young and active) to replace the lost objects by fresh ones equally or still more precious. It is to be hoped that the same will be true of the losses caused by this war. When once the mourning is over, it will be found that our high opinion of the riches of civilization has lost nothing from our discovery of their fragility. We shall build up again all that war has destroyed, and perhaps on firmer ground and more lastingly than before.

SOME CHARACTER-TYPES MET WITH IN PSYCHO-ANALYTIC WORK
(1916)

Intentionally left blank

SOME CHARACTER-TYPES MET WITH IN PSYCHO-ANALYTIC WORK

When a doctor carries out the psycho-analytic treatment of a neurotic, his interest is by no means directed in the first instance to the patient's character. He would much rather know what the symptoms mean, what instinctual impulses are concealed behind them and are satisfied by them, and what course was followed by the mysterious path that has led from the instinctual wishes to the symptoms. But the technique which he is obliged to follow soon compels him to direct his immediate curiosity towards other objectives. He observes that his investigation is threatened by resistances set up against him by the patient, and these resistances he may justly count as part of the latter's character. This now acquires the first claim on his interest.

What opposes the doctor's efforts is not always those traits of character which the patient recognizes in himself and which are attributed to him by people round him. Peculiarities in him which he had seemed to possess only to a modest degree are often brought to light in surprisingly increased intensity, or attitudes reveal themselves in him which had not been betrayed in other relations of life. The pages which follow will be devoted to describing and tracing back a few of these surprising traits of character.

I

THE 'EXCEPTIONS'

Psycho-analytic work is continually confronted with the task of inducing the patient to renounce an immediate and directly attainable yield of pleasure. He is not asked to renounce all pleasure; that could not, perhaps, be expected of any human being, and even religion is obliged to support its demand that earthly pleasure shall be set aside by promising that it will provide instead an incomparably greater amount of superior pleasure in another world. No, the patient is only asked to renounce such satisfactions as will inevitably have detrimental consequences. His privation is only to be temporary; he has only to learn to exchange an immediate yield of pleasure for a better assured, even though a postponed one. Or, in other words, under the doctor's guidance he is asked to make the advance from the pleasure principle to the reality principle by which the mature human being is distinguished from the child. In this educative process, the doctor's clearer insight can hardly be said to play a decisive part; as a rule, he can only tell his patient what the latter's own reason can tell him. But it is not the same to know a thing in one's own mind and to hear it from someone outside. The doctor plays the part of this effective outsider; he makes use of the influence which one human being exercises over another. Or - recalling that it is the habit of psycho-analysis to replace what is derivative and etiolated by what is original and basic - let us say that the doctor, in his educative work, makes use of one of the components of love. In this work of after-education, he is probably doing no more than repeat the process which made education of any kind possible in the first instance. Side by side with the exigencies of life, love is the great educator; and it is by the love of those nearest him that the incomplete human being is induced to respect the decrees of necessity and to spare himself the punishment that follows any infringement of them.

When in this way one asks the patient to make a provisional renunciation of some pleasurable satisfaction, to make a sacrifice, to show his readiness to accept some temporary suffering for the sake of a better end, or even merely to make up his mind to submit to a necessity which applies to everyone, one comes upon individuals who resist such an appeal on a special ground. They say that they have renounced enough and suffered enough, and have a claim to be spared any further demands; they will submit no longer to any disagreeable necessity, for they are *exceptions* and, moreover, intend to remain so. In one such patient this claim was magnified into a conviction that a special providence watched over him, which would protect him from any painful sacrifices of the sort. The doctor's arguments will achieve nothing against an inner confidence which expresses itself as strongly as this; even *his* influence, indeed, is powerless at first, and it becomes clear to him that he must discover the sources from which this damaging prepossession is being fed.

Now it is no doubt true that everyone would like to consider himself an 'exception' and claim privileges over others. But precisely because of this there must be a particular reason, and one not universally present, if someone actually proclaims himself an exception and behaves as such. This reason may be of more than one kind; in the cases I investigated I succeeded in discovering a common peculiarity in the earlier experiences of these patients' lives. Their neuroses were connected with some experience or suffering to which they had been subjected in their earliest childhood, one in respect of which they knew themselves to be guiltless, and which they could look upon as an unjust disadvantage imposed upon them. The privileges that they claimed as a result of this injustice, and the rebelliousness it engendered, had contributed not a little to intensifying the conflicts leading to the outbreak of their neurosis. In one of these patients, a woman, the attitude towards life which I am discussing came to a head when she learnt that a painful organic trouble, which had hindered her from attaining her aims in life, was of congenital origin. So long as she looked upon this trouble as an accidental and late acquisition, she bore it patiently; as soon as she found that it was part of an innate inheritance, she became rebellious. The young man who believed that he was watched over by a special providence had in his infancy been the victim of an accidental infection from his wet-nurse, and had spent his whole later life making claims for compensation, an accident pension, as it were, without having any idea on what he based those claims. In his case the analysis, which constructed this event out of obscure mnemonic residues and interpretations of the symptoms, was confirmed objectively by information from his family.

For reasons which will be easily understood I cannot communicate very much about these or other case histories. Nor do I propose to go into the obvious analogy between deformities of character resulting from protracted sickness in childhood and the behaviour of whole nations whose past history has been full of suffering. Instead, however, I will take the opportunity of pointing to a figure created by the greatest of poets - a figure in whose character the claim to be an exception is closely bound up with and is motivated by the circumstance of congenital disadvantage.

In the opening soliloquy to Shakespeare's *Richard III*, Gloucester, who subsequently becomes King, says:

But I, that am not shaped for sportive tricks,
Nor made to court an amorous looking-glass;
I that am rudely stamp'd, and want love's majesty
To strut before a wanton ambling nymph;
I, that am curtail'd of this fair proportion,
Cheated of feature by dissembling Nature,
Deform'd, unfinish'd, sent before my time
Into this breathing world, scarce half made up,
And that so lamely and unfashionable,
That dogs bark at me as I halt by them;

* * * * *

And therefore, since I cannot prove a lover,
To entertain these fair well-spoken days,
I am determined to prove a villain,
And hate the idle pleasures of these days.

At a first glance this tirade may perhaps seem unrelated to our present theme. Richard seems to say nothing more than: 'I find these idle times tedious, and I want to enjoy myself. As I cannot play the lover on account of my deformity, I will play the villain; I will intrigue, murder and do anything else I please.' Such a frivolous motivation could not but stifle any stirring of sympathy in the audience, if it were not a screen for something much more serious. Otherwise the play would be psychologically impossible, for the writer must know how to furnish us with a secret background of sympathy for his hero, if we are to admire his boldness and adroitness without inward protest; and such sympathy can only be based on understanding or on a sense of a possible inner fellow-feeling for him.

I think, therefore, that Richard's soliloquy does not say everything; it merely gives a hint, and leaves us to fill in what it hints at. When we do so, however, the appearance of frivolity vanishes, the bitterness and minuteness with which Richard has depicted his deformity make their full effect, and we clearly perceive the fellow-feeling which compels our sympathy even with a villain like him. What the soliloquy thus means is: 'nature has done me a grievous wrong in denying me the beauty of form which wins human love. Life owes me reparation for this, and I will see that I get it. I have a right to be an exception, to disregard the scruples by which others let themselves be held back. I may do wrong myself, since wrong has been done to me.' And now we feel that we ourselves might become like Richard, that on a small scale, indeed, we are already like him. Richard is an enormous magnification of something we find in ourselves as well. We all think we have reason to reproach Nature and our destiny for congenital and infantile disadvantages; we all demand reparation for early wounds to our narcissism, our self-love. Why did not Nature give us the golden curls of Balder or the strength of Siegfried or the lofty brow of genius or the noble profile of aristocracy? Why were we born in a middle-class home instead of in a royal palace? We could carry off beauty and distinction quite as well as any of those whom we are now obliged to envy for these qualities.

It is, however, a subtle economy of art in the poet that he does not permit his hero to give open and complete expression to all his secret motives. By this means he obliges us to supplement them; he engages our intellectual activity, diverts it from critical reflection and keeps us firmly identified with his hero. A bungler in his place would give conscious expression to all that he wishes to reveal to us, and would then find himself confronted by our cool, untrammelled intelligence, which would preclude any deepening of the illusion.

Before leaving the 'exceptions', however, we may point out that the claim of women to privileges and to exemption from so many of the importunities of life rests upon the same foundation. As we learn from psycho-analytic work, women regard themselves as having been damaged in infancy, as having been undeservedly cut short of something and unfairly treated; and the embitterment of so many daughters against their mother derives, ultimately, from the reproach against her of having brought them into the world as women instead of as men.

II

THOSE WRECKED BY SUCCESS

Psycho-analytic work has furnished us with the thesis that people fall ill of a neurosis as a result of *frustration*. What is meant is the frustration of the satisfaction of their libidinal wishes, and some digression is necessary in order to make the thesis intelligible. For a neurosis to be generated there must be a conflict between a person's libidinal wishes and the part of his personality we call his ego, which is the expression of his instinct of self-preservation and which also includes his *ideals* of his personality. A pathogenic conflict of this kind takes place only when the libido tries to follow paths and aims which the ego has long since overcome and condemned and has therefore prohibited forever; and this the libido only does if it is deprived of the possibility of an ideal ego-syntonic satisfaction. Hence privation, frustration of a real satisfaction, is the first condition for the generation of a neurosis, although, indeed, it is far from being the only one.

So much the more surprising, and indeed bewildering, must it appear when as a doctor one makes the discovery that people occasionally fall ill precisely when a deeply-rooted and long-cherished wish has come to fulfilment. It seems then as though they were not able to tolerate their happiness; for there can be no question that there is a causal connection between their success and their falling ill.

I had an opportunity of obtaining an insight into a woman's history, which I propose to describe as typical of these tragic occurrences. She was of good birth and well brought-up, but as quite a young girl she could not restrain her zest for life; she ran away from home and roved about the world in search of adventures, till she made the acquaintance of an artist who could appreciate her feminine charms but could also divine, in spite of what she had fallen to, the finer qualities she possessed. He took her to live with him, and she proved a faithful companion to him, and seemed only to need social rehabilitation to achieve complete happiness. After many years of life together, he succeeded in getting his family reconciled to her, and was then prepared to make her his legal wife. At that moment she began to go to pieces. She neglected the house of which she was now about to become the rightful mistress, imagined herself persecuted by his relatives, who wanted to take her into the family, debarred her lover, through her senseless jealousy, from all social intercourse, hindered him in his artistic work, and soon succumbed to an incurable mental illness.

On another occasion I came across the case of a most respectable man who, himself an academic teacher, had for many years cherished the natural wish to succeed the master who had initiated him into his own studies. When this older man retired, and his colleagues informed him that it was he who was chosen as successor, he began to hesitate, depreciated his merits, declared himself unworthy to fill the position designed for him, and fell into a melancholia which unfitted him for all activity for some years.

Different as these two cases are in other respects, they yet agree in this one point: the illness followed close upon the fulfilment of a wish and put an end to all enjoyment of it.

The contradiction between such experiences and the rule that what induces illness is frustration is not insoluble. It disappears if we make a distinction between an *external* and an *internal* frustration. If the object in which the libido can find its satisfaction is withheld *in reality*, this is an external frustration. In itself it is inoperative, not pathogenic, until an internal frustration is joined to it. This latter must proceed from the ego, and must dispute the access by the libido to other objects, which it now seeks to get hold of. Only then does a conflict arise, and the possibility of a neurotic illness, i.e. of a substitutive satisfaction reached circuitously by way of the repressed unconscious. Internal frustration is potentially present, therefore, in every case, only it does not come into operation until external, real frustration has prepared the ground for it. In those exceptional cases in which people are made ill by success, the internal frustration has operated by itself; indeed it has only made its appearance after an external frustration has been replaced by fulfilment of a wish. At first sight there is something strange about this; but on closer consideration we shall reflect that it is not at all unusual for the ego to tolerate a wish as harmless so long as it exists in phantasy alone and seems remote from fulfilment, whereas the ego will defend itself hotly against such a wish as soon as it approaches fulfilment and threatens to become a reality. The distinction between this and familiar situations in neurosis-formation is merely that ordinarily it is internal intensifications of the libidinal cathexis that turn the phantasy, which has hitherto been thought little of and tolerated, into a dreaded opponent; while in these cases of ours the signal for the outbreak of conflict is given by a real external change.

Analytic work has no difficulty in showing us that it is forces of conscience which forbid the subject to gain the long hoped for advantage from the fortunate change in reality. It is a difficult task, however, to discover the essence and origin of these judging and punishing trends, which so often surprise us by their existence where we do not expect to find them. For the usual reasons I shall not discuss what we know or conjecture on the point in relation to cases of clinical observation, but in relation to figures which great writers have created from the wealth of their knowledge of the mind.

We may take as an example of a person who collapses on reaching success, after striving for it with single-minded energy, the figure of Shakespeare's Lady Macbeth. Beforehand there is no hesitation, no sign of any internal conflict in her, no endeavour but that of overcoming the scruples of her ambitious and yet tender-minded husband. She is ready to sacrifice even her womanliness to her murderous intention, without reflecting on the decisive part which this womanliness must play where the question afterwards arises of preserving the aim of her ambition, which has been attained through a crime.

Come, you spirits
That tend on mortal thoughts, unsex me here
. . . Come to my woman's breasts,
And take my milk for gall, you murdering ministers!
(Act I, Sc. 5.)

. . . I have given suck, and know
How tender 'tis to love the babe that milks me:
I would, while it was smiling in my face,
Have pluck'd my nipple from his boneless gums,
And dashed the brains out, had I so sworn as you
Have done to this.
(Act I, Sc. 7.)

One solitary faint stirring of reluctance comes over her before the deed:

. . . Had he not resembled
My father as he slept, I had done it . . .
(Act I, Sc. 2.)

Then, when she has become Queen through the murder of Duncan, she betrays for a moment something like disappointment, something like disillusionment. We cannot tell why.

. . . Nought's had, all's spent,
Where our desire is got without content:
'Tis safer to be that which we destroy,
Than by destruction dwell in doubtful joy.
(Act III, Sc. 2.)

Nevertheless, she holds out. In the banquet scene which follows on these words, she alone keeps her head, cloaks her husband's state of confusion and finds a pretext for dismissing the guests. And then she disappears from view. We next see her in the sleep-walking scene in the last Act, fixated to the impressions of the night of the murder. Once again, as then, she seeks to put heart into her husband:

'Fie, my lord, fie! a soldier, and afeard? What need we fear who
knows it, when none can call our power to account?'
(Act V, Sc. 1.)

She hears the knocking at the door, which terrified her husband after the deed. But at the same time she strives to 'undo the deed which cannot be undone'. She washes her hands, which are blood-stained and smell of blood, and is conscious of the futility of the attempt. She who had seemed so remorseless seems to have been borne down by remorse. When she dies, Macbeth, who meanwhile has become as inexorable as she had been in the beginning, can only find a brief epitaph for her:

She should have died hereafter;
There would have been a time for such a word.
(Act V, Sc. 5.)

And now we ask ourselves what it was that broke this character which had seemed forged from the toughest metal? Is it only disillusionment - the different aspect shown by the accomplished deed - and are we to infer that even in Lady Macbeth an originally gentle and womanly nature had been worked up to a concentration and high tension which could not endure for long, or ought we to seek for signs of a deeper motivation which will make this collapse more humanly intelligible to us?

It seems to me impossible to come to any decision. Shakespeare's *Macbeth* is a *pièce d'occasion*, written for the accession of James, who had hitherto been King of Scotland. The plot was ready-made, and had been handled by other contemporary writers, whose work Shakespeare probably made use of in his customary manner. It offered remarkable analogies to the actual situation. The 'virginal' Elizabeth, of whom it was rumoured that she had never been capable of child-bearing and who had once described herself as 'a barren stock',¹ in an anguished outcry at the news of James's birth, was obliged by this very childlessness of hers to make the Scottish king her successor. And he was the son of the Mary Stuart whose execution she, even though reluctantly, had ordered, and who, in spite of the clouding of their relations by political concerns, was nevertheless of her blood and might be called her guest.

The accession of James I was like a demonstration of the curse of unfruitfulness and the blessings of continuous generation. And the action of Shakespeare's *Macbeth* is based on this same contrast.

The Weird Sisters assured Macbeth that he himself should be king, but to Banquo they promised that his children should succeed to the crown. Macbeth is incensed by this decree of destiny. He is not content with the satisfaction of his own ambition. He wants to found a dynasty - not to have murdered for the benefit of strangers. This point is overlooked if Shakespeare's play is regarded only as a tragedy of ambition. It is clear that Macbeth cannot live for ever, and thus there is but one way for him to invalidate the part of the prophecy which opposes him - namely, to have children himself who can succeed him. And he seems to expect them from his indomitable wife:

Bring forth men-children only!
For thy undaunted mettle should compose
Nothing but males

(Act I, Sc. 7.)

¹ Cf. *Macbeth*, Act III, Sc. 1:

Upon my head they placed a fruitless crown,
And put a barren sceptre in my gripe,
Thence to be wrenched with an unlineal hand,
No son of mine succeeding . . .

And equally it is clear that if he is deceived in this expectation he must submit to destiny; otherwise his actions lose all purpose and are transformed into the blind fury of one doomed to destruction, who is resolved to destroy beforehand all that he can reach. We watch Macbeth pass through this development, and at the height of the tragedy we hear Macduff's shattering cry, which has so often been recognized to be ambiguous and which may perhaps contain the key to the change in Macbeth:

He has no children!

(Act IV, Sc. 3.)

There is no doubt that this means: 'Only because he is himself childless could he murder my children.' But more may be implied in it, and above all it might lay bare the deepest motive which not only forces Macbeth to go far beyond his own nature, but also touches the hard character of his wife at its only weak point. If one surveys the whole play from the summit marked by these words of Macduff's, one sees that it is sown with references to the father-children relation. The murder of the kindly Duncan is little else than parricide; in Banquo's case, Macbeth kills the father while the son escapes him; and in Macduff's, he kills the children because the father has fled from him. A bloody child, and then a crowned one, are shown him by the witches in the apparition scene; the armed head which is seen earlier is no doubt Macbeth himself. But in the background rises the sinister form of the avenger, Macduff, who is himself an exception to the laws of generation, since he was not born of his mother but ripped from her womb.

It would be a perfect example of poetic justice in the manner of the talion if the childlessness of Macbeth and the barrenness of his Lady were the punishment for their crimes against the sanctity of generation - if Macbeth could not become a father because he had robbed children of their father and a father of his children, and if Lady Macbeth suffered the unsexing she had demanded of the spirits of murder. I believe Lady Macbeth's illness, the transformation of her callousness into penitence, could be explained directly as a reaction to her childlessness, by which she is convinced of her impotence against the decrees of nature, and at the same time reminded that it is through her own fault if her crime has been robbed of the better part of its fruits.

In Holinshed's *Chronicle* (1577), from which Shakespeare took the plot of *Macbeth*, Lady Macbeth is only once mentioned as the ambitious wife who instigates her husband to murder in order that she may herself become queen. There is no mention of her subsequent fate and of the development of her character. On the other hand, it would seem that the change of Macbeth's character into a bloodthirsty tyrant is ascribed to the same motives as we have suggested here. For in Holinshed *ten years* pass between the murder of Duncan, through which Macbeth becomes king, and his further misdeeds; and in these ten years he is shown as a stern but just ruler. It is not until after this lapse of time that the change begins in him, under the influence of the tormenting fear that the prophecy to Banquo may be fulfilled just as the prophecy of his own destiny has been. Only then does he contrive the murder of Banquo, and, as in Shakespeare, is driven from one crime to another. It is not expressly stated in Holinshed that it was his childlessness which urged him to these courses, but enough time and room is given for that plausible motive. Not so in Shakespeare. Events crowd upon us in the tragedy with breathless haste so that, to judge by the statements made by the characters in it, the course of its action covers about *one week*.¹ This acceleration takes the ground from under all our constructions of the motives for the change in the characters of Macbeth and his wife. There is no time for a long drawn-out disappointment of their hopes of offspring to break the woman down and drive the man to defiant rage; and the contradiction remains that though so many subtle interrelations in the plot, and between it and its occasion, point to a common origin of them in the theme of childlessness, nevertheless the economy of time in the tragedy expressly precludes a development of character from any motives but those inherent in the action itself.

¹ Darmesteter (1881, lxxv).

What, however, these motives can have been which in so short a space of time could turn the hesitating, ambitious man into an unbridled tyrant, and his steely-hearted instigator into a sick woman gnawed by remorse, it is, in my view, impossible to guess. We must, I think, give up any hope of penetrating the triple layer of obscurity into which the bad preservation of the text, the unknown intention of the dramatist, and the hidden purport of the legend have become condensed. But I should not subscribe to the objection that investigations like these are idle in face of the powerful effect which the tragedy has upon the spectator. The dramatist can indeed, during the representation, overwhelm us by his art and paralyse our powers of reflection; but he cannot prevent us from attempting subsequently, to grasp its effect by studying its psychological mechanism. Nor does the contention that a dramatist is at liberty to shorten at will the natural chronology of the events he brings before us, if by the sacrifice of common probability he can enhance the dramatic effect, seem to me relevant in this instance. For such a sacrifice is justified only when it merely interferes with probability,¹ and not when it breaks the causal connection; moreover, the dramatic effect would hardly have suffered if the passage of time had been left indeterminate, instead of being expressly limited to a few days.

One is so unwilling to dismiss a problem like that of *Macbeth* as insoluble that I will venture to bring up a fresh point, which may offer another way out of the difficulty. Ludwig Jekels, in a recent Shakespearean study, thinks he has discovered a particular technique of the poet's, and this might apply to *Macbeth*. He believes that Shakespeare often splits a character up into two personages, which, taken separately, are not completely understandable and do not become so until they are brought together once more into a unity. This might be so with Macbeth and Lady Macbeth. In that case it would of course be pointless to regard her as an independent character and seek to discover the motives for her change, without considering the Macbeth who completes her. I shall not follow this clue any further, but I should, nevertheless, like to point out something which strikingly confirms this view: the germs of fear which break out in Macbeth on the night of the murder do not develop further in *him* but in *her*.² It is he who has the hallucination of the dagger before the crime; but it is she who afterwards falls ill of a mental disorder. It is he who after the murder hears the cry in the house: 'Sleep no more! Macbeth does murder sleep . . .' and so 'Macbeth shall sleep no more'; but we never hear that *he* slept no more, while the Queen, as we see, rises from her bed and, talking in her sleep, betrays her guilt. It is he who stands helpless with bloody hands, lamenting that 'all great Neptune's ocean' will not wash them clean, while she comforts him: 'A little water clears us of this deed'; but later it is she who washes her hands for a quarter of an hour and cannot get rid of the bloodstains: 'All the perfumes of Arabia will not sweeten this little hand.' Thus what he feared in his pangs of conscience is fulfilled in her; she becomes all remorse and he all defiance. Together they exhaust the possibilities of reaction to the crime, like two disunited parts of a single psychical individuality, and it may be that they are both copied from a single prototype.

¹ As in Richard III's wooing of Anne beside the bier of the King whom he has murdered.

² Cf. Darmesteter (1881, lxxv).

If we have been unable to give any answer to the question why Lady Macbeth should collapse after her success, we may perhaps have a better chance when we turn to the creation of another great dramatist, who loves to pursue problems of psychological responsibility with unrelenting rigour.

Rebecca Gamvik, the daughter of a midwife, has been brought up by her adopted father, Dr. West, to be a freethinker and to despise the restrictions which a morality founded on religious belief seeks to impose on the desires of life. After the doctor's death she finds a position at Rosmersholm, the home for many generations of an ancient family whose members know nothing of laughter and have sacrificed joy to a rigid fulfilment of duty. Its occupants are Johannes Rosmer, a former pastor, and his invalid wife, the childless Beata. Overcome by 'a wild, uncontrollable passion' for the love of the high-born Rosmer, Rebecca resolves to remove the wife who stands in her way, and to this end makes use of her 'fearless, free' will, which is restrained by no scruples. She contrives that Beata shall read a medical book in which the aim of marriage is represented to be the begetting of offspring, so that the poor woman begins to doubt whether her own marriage is justifiable. Rebecca then hints that Rosmer, whose studies and ideas she shares, is about to abandon the old faith and join the 'party of enlightenment'; and after she has thus shaken the wife's confidence in her husband's moral integrity, gives her finally to understand that she, Rebecca, will soon leave the house in order to conceal the consequences of her illicit intercourse with Rosmer. The criminal scheme succeeds. The poor wife, who has passed for depressed and irresponsible, throws herself from the path beside the mill into the mill-race, possessed by the sense of her own worthlessness and wishing no longer to stand between her beloved husband and his happiness.

For more than a year Rebecca and Rosmer have been living alone at Rosmersholm in a relationship which he wishes to regard as a purely intellectual and ideal friendship. But when this relationship begins to be darkened from outside by the first shadow of gossip, and at the same time tormenting doubts arise in Rosmer about the motives for which his wife put an end to herself, he begs Rebecca to become his second wife, so that they may counter the unhappy past with a new living reality (Act II). For an instant she exclaims with joy at his proposal, but immediately afterwards declares that it can never be, and that if he urges her further she will 'go the way Beata went'. Rosmer cannot understand this rejection; and still less can we, who know more of Rebecca's actions and designs. All we can be certain of is that her 'no' is meant in earnest.

How could it come about that the adventuress with the 'fearless, free will', who forged her way ruthlessly to her desired goal, should now refuse to pluck the fruit of success when it is offered to her? She herself gives us the explanation in the fourth Act: '*This* is the terrible part of it: that now, when all life's happiness is within my grasp - my heart is changed and my own past cuts me off from it.' That is to say, she has in the meantime become a different being; her conscience has awakened, she has acquired a sense of guilt which debars her from enjoyment.

And what has awakened her conscience? Let us listen to her herself, and then consider whether we can believe her entirely. 'It is the Rosmer view of life - or your view of life at any rate - that has infected my will. . . . And made it sick. Enslaved it to laws that had no power over me before. You - life with you has ennobled my mind.'

This influence, we are further to understand, has only become effective since she has been able to live alone with Rosmer: 'In quiet - in solitude - when you showed me all your thoughts without reserve - every tender and delicate feeling, just as it came to you - *then* the great change came over me.'

Shortly before this she has lamented the other aspect of the change: 'Because Rosmersholm has sapped my strength. My old fearless will has had its wings clipped here. It is crippled! The time is past when I had courage for anything in the world. I have lost the power of action, Rosmer.'

Rebecca makes this declaration after she had revealed herself as a criminal in a voluntary confession to Rosmer and Rector Kroll, the brother of the woman she has got rid of. Ibsen has made it clear by small touches of masterly subtlety that Rebecca does not actually tell lies, but is never entirely straightforward. Just as, in spite of all her freedom from prejudices, she has understated her age by a year, so her confession to the two men is incomplete, and as a result of Kroll's insistence it is supplemented on some important points. Hence it is open to us to suppose that her explanation of her renunciation exposes one motive only to conceal another.

Certainly, we have no reason to disbelieve her when she declares that the atmosphere of Rosmersholm and her association with the high-minded Rosmer have ennobled - and crippled - her. She is here expressing what she knows and has felt. But this is not necessarily all that has happened in her, nor need she have understood all that has happened. Rosmer's influence may only have been a cloak, which concealed another influence that was operative, and a remarkable indication points in this other direction.

Even after her confession, Rosmer, in their last conversation which brings the play to an end, again beseeches her to be his wife. He forgives her the crime she has committed for love of him. And now she does not answer, as she should, that no forgiveness can rid her of the feeling of guilt she has incurred from her malignant deception of poor Beata; but she charges herself with another reproach which affects us as coming strangely from this freethinking woman, and is far from deserving the importance which Rebecca attaches to it: 'Dear - never speak of this again! It is impossible! For you must know, Rosmer, I have a - a past behind me.' She means, of course, that she has had sexual relations with another man; and we do not fail to observe that these relations, which occurred at a time when she was free and accountable to nobody, seem to her a greater hindrance to the union with Rosmer than her truly criminal behaviour to his wife.

Rosmer refuses to hear anything about this past. We can guess what it was, though everything that refers to it in the play is, so to speak, subterranean and has to be pieced together from hints. But nevertheless they are hints inserted with such art that it is impossible to misunderstand them.

Between Rebecca's first refusal and her confession something occurs which has a decisive influence on her future destiny. Rector Kroll arrives one day at the house on purpose to humiliate Rebecca by telling her that he knows she is an illegitimate child, the daughter of the very Dr. West who adopted her after her mother's death. Hate has sharpened his perceptions, yet he does not suppose that this is any news to her. 'I really did not suppose you were ignorant of this, otherwise it would have been very odd that you should have let Dr. West adopt you . . .' 'And then he takes you into his house - as soon as your mother dies. He treats you harshly. And yet you stay with him. You know that he won't leave you a halfpenny - as a matter of fact you got only a case of books - and yet you stay on; you bear with him; you nurse him to the last.' . . . 'I attribute your care for him to the natural filial instinct of a daughter. Indeed, I believe your whole conduct is a natural result of your origin.'

But Kroll is mistaken. Rebecca had no idea at all that she could be Dr. West's daughter. When Kroll began with dark hints at her past, she must have thought he was referring to something else. After she has gathered what he means, she can still retain her composure for a while, for she is able to suppose that her enemy is basing his calculations on her age, which she had given falsely on an earlier visit of his. But Kroll demolishes this objection by saying: 'Well, so be it, but my calculation may be right, none the less; for Dr. West was up there on a short visit the year before he got the appointment.' After this new information, she loses her self-possession. 'It is not true!' She walks about wringing her hands. 'It is impossible. You want to cheat me into believing it. This can never, never be true. It cannot be true. Never in this world! - Her agitation is so extreme that Kroll cannot attribute it to his information alone.

'KROLL: But, my dear Miss West - why in Heaven's name are you so terribly excited? You quite frighten me. What am I to think - to believe--?

'REBECCA: Nothing. You are to think and believe nothing.

'KROLL: Then you must really tell me how you can take this affair - this possibility - so terribly to heart.

'REBECCA (*controlling herself*): It is perfectly simple, Rector Kroll. I have no wish to be taken for an illegitimate child.'

The enigma of Rebecca's behaviour is susceptible of only one solution. The news that Dr. West was her father is the heaviest blow that can befall her, for she was not only his adopted daughter, but had been his mistress. When Kroll began to speak, she thought that he was hinting at these relations, the truth of which she would probably have admitted and justified by her emancipated ideas. But this was far from the Rector's intention; he knew nothing of the love-affair with Dr. West, just as she knew nothing of Dr. West's being her father. She *cannot* have had anything else in her mind but this love-affair when she accounted for her final rejection of Rosmer on the ground that she had a past which made her unworthy to be his wife. And probably, if Rosmer had consented to hear of that past, she would have confessed half her secret only and have kept silence on the more serious part of it.

But now we understand, of course, that this past must seem to her the more serious obstacle to their union - the more serious crime.

After she has learnt that she has been the mistress of her own father, she surrenders herself wholly to her now overmastering sense of guilt. She makes the confession to Rosmer and Kroll which stamps her as a murderess; she rejects for ever the happiness to which she has paved the way by crime, and prepares for departure. But the true motive of her sense of guilt, which results in her being wrecked by success, remains a secret. As we have seen, it is something quite other than the atmosphere of Rosmersholm and the refining influence of Rosmer.

At this point no one who has followed us will fail to bring forward an objection which may justify some doubts. Rebecca's first refusal of Rosmer occurs before Kroll's second visit, and therefore before his exposure of her illegitimate origin and at a time when she as yet knows nothing of her incest - if we have rightly understood the dramatist. Yet this first refusal is energetic and seriously meant. The sense of guilt which bids her renounce the fruit of her actions is thus effective before she knows anything of her cardinal crime; and if we grant so much, we ought perhaps entirely to set aside her incest as a source of that sense of guilt.

So far we have treated Rebecca West as if she were a living person and not a creation of Ibsen's imagination, which is always directed by the most critical intelligence. We may therefore attempt to maintain the same position in dealing with the objection that has been raised. The objection is valid: before the knowledge of her incest, conscience was already in part awakened in Rebecca; and there is nothing to prevent our making the influence which is acknowledged and blamed by Rebecca herself responsible for this change. But this does not exempt us from recognizing the second motive. Rebecca's behaviour when she hears what Kroll has to tell her, the confession which is her immediate reaction, leave no doubt that then only does the stronger and decisive motive for renunciation begin to take effect. It is in fact a case of multiple motivation, in which a deeper motive comes into view behind the more superficial one. Laws of poetic economy necessitate this way of presenting the situation, for this deeper motive could not be explicitly enunciated. It had to remain concealed, kept from the easy perception of the spectator or the reader; otherwise serious resistances, based on the most distressing emotions, would have arisen, which might have imperilled the effect of the drama.

We have, however, a right to demand that the explicit motive shall not be without an internal connection with the concealed one, but shall appear as a mitigation of, and a derivation from, the latter. And if we may rely on the fact that the dramatist's conscious creative combination arose logically from unconscious premisses, we may now make an attempt to show that he has fulfilled this demand. Rebecca's feeling of guilt has its source in the reproach of incest, even before Kroll, with analytical perspicacity, has made her conscious of it. If we reconstruct her past, expanding and filling in the author's hints, we may feel sure that she cannot have been without some inkling of the intimate relation between her mother and Dr. West. It must have made a great impression on her when she became her mother's successor with this man. She stood under the domination of the Oedipus complex, even though she did not know that this universal phantasy had in her case become a reality. When she came to Rosmersholm, the inner force of this first experience drove her into bringing about, by vigorous action, the same situation which had been realized in the original instance through no doing of hers - into getting rid of the wife and mother, so that she might take her place with the husband and father. She describes with a convincing insistence how, against her will, she was obliged to proceed, step by step, to the removal of Beata.

'You think then that I was cool and calculating and self-possessed all the time! I was not the same woman then that I am now, as I stand here telling it all. Besides, there are two sorts of will in us, I believe! I wanted Beata away, by one means or another; but I never really believed that it would come to pass. As I felt my way forward, at each step I ventured, I seemed to hear something within me cry out: No farther! Not a step farther! And yet I *could* not stop, I *had* to venture the least little bit farther. And only one hair's-breadth more. And then one more - and always one more. And then it happened. - That is the way such things come about.'

That is not an embellishment, but an authentic description. Everything that happened to her at Rosmersholm, her falling in love with Rosmer and her hostility to his wife, was from the first a consequence of the Oedipus complex - an inevitable replica of her relations with her mother and Dr. West.

And so the sense of guilt which first causes her to reject Rosmer's proposal is at bottom no different from the greater one which drives her to her confession after Kroll has opened her eyes. But just as under the influence of Dr. West she had become a freethinker and despiser of religious morality, so she is transformed by her love for Rosmer into a being of conscience and nobility. This much of the mental processes within her she herself understands, and so she is justified in describing Rosmer's influence as the motive for her change - the motive that had become accessible to her.

The practising psycho-analytic physician knows how frequently, or how invariably, a girl who enters a household as servant, companion or governess, will consciously or unconsciously weave a day-dream, which derives from the Oedipus complex, of the mistress of the house disappearing and the master taking the newcomer as his wife in her place. *Rosmersholm* is the greatest work of art of the class that treats of this common phantasy in girls. What makes it into a tragic drama is the extra circumstance that the heroine's day-dream had been preceded in her childhood by a precisely corresponding reality.¹

After this long digression into literature, let us return to clinical experience - but only to establish in a few words the complete agreement between them. Psycho-analytic work teaches that the forces of conscience which induce illness in consequence of success, instead of, as normally, in consequence of frustration, are closely connected with the Oedipus complex, the relation to father and mother - as perhaps, indeed, is our sense of guilt in general.

¹ The presence of the theme of incest in *Rosmersholm* has already been demonstrated by the same arguments as mine in Otto Rank's extremely comprehensive *Das Inzest-Motiv in Dichtung und Sage* (1912).

III

CRIMINALS FROM A SENSE OF GUILT

In telling me about their early youth, particularly before puberty, people who have afterwards often become very respectable have informed me of forbidden actions which they committed at that time - such as thefts, frauds and even arson. I was in the habit of dismissing these statements with the comment that we are familiar with the weakness of moral inhibitions at that period of life, and I made no attempt to find a place for them in any more significant context. But eventually I was led to make a more thorough study of such incidents by some glaring and more accessible cases in which the misdeeds were committed while the patients were actually under my treatment, and were no longer so youthful. Analytic work then brought the surprising discovery that such deeds were done principally because they were forbidden, and because their execution was accompanied by mental relief for their doer. He was suffering from an oppressive feeling of guilt, of which he did not know the origin, and after he had committed a misdeed this oppression was mitigated. His sense of guilt was at least attached to something.

Paradoxical as it may sound, I must maintain that the sense of guilt was present before the misdeed, that it did not arise from it, but conversely - the misdeed arose from the sense of guilt. These people might justly be described as criminals from a sense of guilt. The pre-existence of the guilty feeling had of course been demonstrated by a whole set of other manifestations and effects.

But scientific work is not satisfied with the establishment of a curious fact. There are two further questions to answer: what is the origin of this obscure sense of guilt before the deed, and is it probable that this kind of causation plays any considerable part in human crime?

An examination of the first question held out the promise of bringing us information about the source of mankind's sense of guilt in general. The invariable outcome of analytic work was to show that this obscure sense of guilt derived from the Oedipus complex and was a reaction to the two great criminal intentions of killing the father and having sexual relations with the mother. In comparison with these two, the crimes committed in order to fix the sense of guilt to something came as a relief to the sufferers. We must remember in this connection that parricide and incest with the mother are the two great human crimes, the only ones which, as such, are pursued and abhorred in primitive communities. And we must remember, too, how close other investigations have brought us to the hypothesis that the conscience of mankind, which now appears as an inherited mental force, was acquired in connection with the Oedipus complex.

In order to answer the second question we must go beyond the scope of psycho-analytic work. With children it is easy to observe that they are often 'naughty' on purpose to provoke punishment, and are quiet and contented after they have been punished. Later analytic investigation can often put us on the track of the guilty feeling which induced them to seek punishment. Among adult criminals we must no doubt except those who commit crimes without any sense of guilt, who have either developed no moral inhibitions or who, in their conflict with society, consider themselves justified in their action. But as regards the majority of other criminals, those for whom punitive measures are really designed, such a motivation for crime might very well be taken into consideration; it might throw light on some obscure points in the psychology of the criminal, and furnish punishment with a new psychological basis.

A friend has since called my attention to the fact that the 'criminal from a sense of guilt' was known to Nietzsche too. The pre-existence of the feeling of guilt, and the utilization of a deed in order to rationalize this feeling, glimmer before us in Zarathustra's sayings 'On the Pale Criminal'. Let us leave it to future research to decide how many criminals are to be reckoned among these 'pale' ones.

A MYTHOLOGICAL PARALLEL TO A VISUAL OBSESSION (1916)

In a patient of about twenty-one years of age the products of unconscious mental activity became conscious not only in obsessive thoughts but also in obsessive images. The two could accompany each other or appear independently. At one particular time, whenever he saw his father entering the room, there came into his mind in close connection an obsessive word and an obsessive image. The word was '*Vaterarsch*' ['father-ar-se']; the accompanying image represented his father as the naked lower part of a body, provided with arms and legs, but without the head or upper part. The genitals were not indicated, and the facial features were painted on the abdomen.

It will help to explain this more than usually absurd symptom if I mention that the patient, who was a man of fully developed intellect and high moral ideals, manifested a very lively anal erotism in the most various ways until after his tenth year. After this had been got over, his sexual life was once again forced back to the preliminary anal stage by his later struggle against genital erotism. He loved and respected his father greatly, and also feared him not a little; judged by his own high standards in regard to asceticism and the suppression of the instincts, however, his father seemed to him a person who stood for debauchery and the pursuit of enjoyment in material things.

'Father-ar-se' was soon explained as a jocular Teutonizing of the honorific title of 'patriarch'. The obsessive image is an obvious caricature. It recalls other representations which, with a derogatory end in view, replace a whole person by one of his organs, e.g. his genitals; it reminds us, too, of unconscious phantasies which lead to the identification of the genitals with the whole person, and also of joking figures of speech, such as 'I am all ears'.

The placing of the facial features on the abdomen of the caricature struck me at first as very strange. But I soon remembered having seen the same thing in French caricatures.¹ Chance then brought to my notice an antique representation, which tallied exactly with my patient's obsessive image.

According to the Greek legend, Demeter came to Eleusis in search of her daughter after she had been abducted, and was given lodging by Dysaules and his wife Baubo; but in her great sorrow she refused to touch food or drink. Thereupon her hostess Baubo made her laugh by suddenly lifting up her dress and exposing her body. A discussion of this anecdote, which was probably intended to explain a magic ceremonial which was no longer understood, is to be found in the fourth volume of Salomon Reinach's work, *Culte, Mythes, et Religions*, 1912. In the same passage the author mentions that during the excavations at Priene in Asia Minor some terracottas were found which represented Baubo. They show the body of a woman without a head or chest and with a face drawn on the abdomen: the lifted dress frames this face like a crown of hair (ibid., 117).

¹ Cf. 'L'impudique Albion', a caricature of England drawn in 1901 by Jean Véber, reproduced in Fuchs, 1908.

A CONNECTION BETWEEN A SYMBOL AND A SYMPTOM (1916)

Experience in the analysis of dreams has sufficiently well established the hat as a symbol of the genital organ, most frequently of the male organ. It cannot be said, however, that the symbol is an intelligible one. In phantasies and in numerous symptoms the head too appears as a symbol of the male genitals, or, if one prefers to put it so, as something standing for them. It will sometimes have been noticed that patients suffering from obsessions express an amount of abhorrence of and indignation against punishment by beheading far greater than they do in the case of any other form of death; and in such cases the analyst may be led to explain to them that they are treating being beheaded as a substitute for being castrated. Instances have often been analysed and published of dreams dreamt by young people or reported as having occurred in youth, which concerned the subject of castration, and in which a round ball was mentioned which could only be interpreted as the head of the dreamer's father. I was recently able to solve a ceremonial performed by a woman patient before going to sleep, in which she had to lay her small top pillow diamond-wise on the other ones and to rest her head exactly in the long diameter of the diamond-shape. The diamond had the meaning that is familiar to us from drawings on walls [*graffiti*]; the head was supposed to represent a male organ.

It may be that the symbolic meaning of the hat is derived from that of the head, in so far as a hat can be regarded as a prolonged, though detachable head. In this connection I am reminded of a symptom by means of which obsessional neurotics succeed in causing themselves continual torments. When they are in the street they are constantly on the look-out to see whether some acquaintance will greet them first by taking off his hat, or whether he seems to be waiting for *their* salutation; and they give up a number of their acquaintances after discovering that they no longer greet them or do not return their own salutation properly. There is no end to their difficulties in this connection; they find them everywhere as their mood and fancy dictate. It makes no difference to their behaviour when we tell them, what they all know already, that a salutation by taking off the hat has the meaning of an abasement before the person saluted - that a Spanish grandee, for example, enjoyed the privilege of remaining covered in the king's presence - and that their own sensitiveness on the subject of greeting therefore means that they are unwilling to show themselves less important than the other person thinks he is. The resistance of their sensitiveness to explanations such as this suggests that a motive less familiar to consciousness is at work; and the source of this excess of feeling might easily be found in its relation to the castration complex.

LETTER TO DR. HERMINE VON HUG-HELLMUTH
(1919 [1915])

The diary is a little gem. I really believe it has never before been possible to obtain such a clear and truthful view of the mental impulses that characterize the development of a girl in our social and cultural stratum during the years before puberty. We are shown how her feelings grow up out of a childish egoism till they reach social maturity; we learn what form is first assumed by her relations with her parents and with her brothers and sisters and how they gradually gain in seriousness and inward feeling; how friendships are made and broken; how her affection feels its way towards her first objects; and, above all, how the secret of sexual life begins to dawn on her indistinctly and then takes complete possession of the child's mind; how, in the consciousness of her secret knowledge, she at first suffers hurt, but little by little overcomes it. All of this is so charmingly, so naturally, and so gravely expressed in these artless notes that they cannot fail to arouse the greatest interest in educators and psychologists . . . It is your duty, I think, to publish the diary. My readers will be grateful to you for it.

INTRODUCTORY LECTURES ON PSYCHO-ANALYSIS
(1916-17)

Intentionally left blank

PREFACE

What I am here offering the public as an 'Introduction to Psycho-Analysis' is not designed to compete in any way with such general accounts of this field of knowledge as are already in existence, e.g. those of Hitschmann (1913), Pfister (1913), Kaplan (1914), Régis and Hesnard (1914) and Meijer (1915). This volume is a faithful reproduction of the lectures which I delivered during the two Winter Terms 1915/16 and 1916/17 before an audience of doctors and laymen of both sexes.

Any peculiarities of this book which may strike its readers are accounted for by the conditions in which it originated. It was not possible in my presentation to preserve the unruffled calm of a scientific treatise. On the contrary, the lecturer had to make it his business to prevent his audience's attention from lapsing during a session lasting for almost two hours. The necessities of the moment often made it impossible to avoid repetitions in treating some particular subject - it might emerge once, for instance, in connection with dream-interpretation and then again later on in connection with the problems of the neuroses. As a result, too, of the way in which the material was arranged, some important topics (the unconscious, for instance) could not be exhaustively treated at a single point, but had to be taken up repeatedly and then dropped again until a fresh opportunity arose for adding some further information about it.

Those who are familiar with psycho-analytic literature will find little in this 'Introduction' that could not have been known to them already from other much more detailed publications. Nevertheless, the need for rounding-off and summarizing the subject-matter has compelled the author at certain points (the aetiology of anxiety and hysterical phantasies) to bring forward material that he has hitherto held back.

FREUD

VIENNA, *Spring* 1917

PREFACE TO THE HEBREW TRANSLATION

These lectures were delivered in 1916 and 1917; they gave a fairly accurate account of the position of the young science at that period and they contained more than their title indicated. They provided not only an introduction to psycho-analysis but covered the greater part of its subject-matter. This is naturally no longer true. Advances have in the meantime taken place in its theory and important additions have been made to it, such as the division of the personality into an ego, a super-ego and an id, a radical alteration in the theory of the instincts, and discoveries concerning the origin of conscience and the sense of guilt. These lectures have thus become to a large extent incomplete; it is in fact only now that they have become truly 'introductory'. But in another sense, even to-day they have not been superseded or become obsolete. What they contain is still believed and taught, apart from a few modifications, in psycho-analytic training schools.

Readers of Hebrew and especially young people eager for knowledge are presented in this volume with psycho-analysis clothed in the ancient language which has been awakened to a new life by the will of the Jewish people. The author can well picture the problem which this has set its translator. Nor need he suppress his doubt whether Moses and the Prophets would have found these Hebrew lectures intelligible. But he begs their descendants (among whom he himself is numbered), for whom this book is designed, not to react too quickly to their first impulses of criticism and dislike by rejecting it. Psycho-analysis brings forward so much that is new, and among it so much that contradicts traditional opinions and wounds deeply rooted feelings, that it is bound at first to provoke denial. A reader who suspends his judgement and allows psycho-analysis as a whole to make its impression on him will perhaps become open to a conviction that even this undesired novelty is worth knowing and is indispensable for anyone who wishes to understand the mind and human life.

VIENNA, *December* 1930

Introductory Lectures On Psycho-Analysis

3128

PART I

PARAPRAXES

(1916)

LECTURE I

INTRODUCTION

LADIES AND GENTLEMEN, - I cannot tell how much knowledge about psycho-analysis each one of you has already acquired from what you have read or from hearsay. But the wording of my prospectus - 'Elementary Introduction to Psycho-Analysis' - obliges me to treat you as though you knew nothing and stood in need of some preliminary information.

I can, however, assume this much - that you know that psycho-analysis is a procedure for the medical treatment of neurotic patients. And here I can at once give you an instance of how in this field a number of things take place in a different way - often, indeed, in an opposite way - from what they do elsewhere in medical practice. When elsewhere we introduce a patient to a medical technique which is new to him, we usually minimize its inconveniences and give him confident assurances of the success of the treatment. I think we are justified in this, since by doing so we are increasing the probability of success. But when we take a neurotic patient into psycho-analytic treatment, we act differently. We point out the difficulties of the method to him, its long duration, the efforts and sacrifices it calls for; and as regards its success, we tell him we cannot promise it with certainty, that it depends on his own conduct, his understanding, his adaptability and his perseverance. We have good reasons, of course, for such apparently wrong-headed behaviour, as you will perhaps come to appreciate later on.

Do not be annoyed, then, if I begin by treating you in the same way as these neurotic patients. I seriously advise you not to join my audience a second time. To support this advice, I will explain to you how incomplete any instruction in psycho-analysis must necessarily be and what difficulties stand in the way of your forming a judgement of your own upon it. I will show you how the whole trend of your previous education and all your habits of thought are inevitably bound to make you into opponents of psycho-analysis, and how much you would have to overcome in yourselves in order to get the better of this instinctive opposition. I cannot, of course, foretell how much understanding of psycho-analysis you will obtain from the information I give you, but I can promise you this: that by listening to it you will not have learnt how to set about a psycho-analytic investigation or how to carry a treatment through. If, however, there should actually turn out to be one of you who did not feel satisfied by a fleeting acquaintance with psycho-analysis but was inclined to enter into a permanent relationship to it, I should not merely dissuade him from doing so but actively warn him against it. As things stand at present, such a choice of profession would ruin any chance he might have of success at a University, and, if he started in life as a practising physician, he would find himself in a society which did not understand his efforts, which regarded him with distrust and hostility, and unleashed upon him all the evil spirits lurking within it. And the phenomena accompanying the war that is now raging in Europe will perhaps give you some notion of what legions of these evil spirits there may be.

Nevertheless, there are quite a number of people for whom, in spite of these inconveniences, something that promises to bring them a fresh piece of knowledge still has its attraction. If a few of you should be of this sort and in spite of my warnings appear here again for my next lecture, you will be welcome. All of you, however, have a right to learn the nature of the difficulties of psycho-analysis to which I have alluded.

I will begin with those connected with instruction, with training in psycho-analysis. In medical training you are accustomed to see things. You see an anatomical preparation, the precipitate of a chemical reaction, the shortening of a muscle as a result of the stimulation of its nerves. Later on, patients are demonstrated before your senses - the symptoms of their illness, the products of the pathological process and even in many cases the agent of the disease in isolation. In the surgical departments you are witnesses of the active measures taken to bring help to patients, and you may yourselves attempt to put them into effect. Even in psychiatry the demonstration of patients with their altered facial expressions, their mode of speech and their behaviour, affords you plenty of observations which leave a deep impression on you. Thus a medical teacher plays in the main the part of a leader and interpreter who accompanies you through a museum, while you gain a direct contact with the objects exhibited and feel yourselves convinced of the existence of the new facts through your own perception.

In psycho-analysis, alas, everything is different. Nothing takes place in a psycho-analytic treatment but an interchange of words between the patient and the analyst. The patient talks, tells of his past experiences and present impressions, complains, confesses to his wishes and his emotional impulses. The doctor listens, tries to direct the patient's processes of thought, exhorts, forces his attention in certain directions, gives him explanations and observes the reactions of understanding or rejection which he in this way provokes in him. The uninstructed relatives of our patients, who are only impressed by visible and tangible things - preferably by actions of the sort that are to be witnessed at the cinema - never fail to express their doubts whether 'anything can be done about the illness by mere talking'. That, of course, is both a short-sighted and an inconsistent line of thought. These are the same people who are so certain that patients are 'simply imagining' their symptoms. Words were originally magic and to this day words have retained much of their ancient magical power. By words one person can make another blissfully happy or drive him to despair, by words the teacher conveys his knowledge to his pupils, by words the orator carries his audience with him and determines their judgements and decisions. Words provoke affects and are in general the means of mutual influence among men. Thus we shall not depreciate the use of words in psychotherapy and we shall be pleased if we can listen to the words that pass between the analyst and his patient.

But we cannot do that either. The talk of which psycho-analytic treatment consists brooks no listener; it cannot be demonstrated. A neurasthenic or hysterical patient can of course, like any other, be introduced to students in a psychiatric lecture. He will give an account of his complaints and symptoms, but of nothing else. The information required by analysis will be given by him only on condition of his having a special emotional attachment to the doctor; he would become silent as soon as he observed a single witness to whom he felt indifferent. For this information concerns what is most intimate in his mental life, everything that, as a socially independent person, he must conceal from other people, and, beyond that, everything that, as a homogeneous personality, he will not admit to himself.

Thus you cannot be present as an audience at a psycho-analytic treatment. You can only be told about it; and, in the strictest sense of the word, it is only by hearsay that you will get to know psycho-analysis. As a result of receiving your instruction at second hand, as it were, you find yourselves under quite unusual conditions for forming a judgement. That will obviously depend for the most part on how much credence you can give to your informant.

Let us assume for a moment that you were attending a lecture not on psychiatry but on history, and that the lecturer was telling you of the life and military deeds of Alexander the Great. What grounds would you have for believing in the truth of what he reported? At a first glance the position would seem to be even more unfavourable than in the case of psycho-analysis, for the Professor of History no more took part in Alexander's campaigns than you did. The psycho-analyst does at least report things in which he himself played a part. But in due course we come to the things that confirm what the historian has told you. He could refer you to the reports given by ancient writers, who were either themselves contemporary with the events under question or, at any rate, were comparatively close to them - he could refer you, that is to say, to the works of Diodorus, Plutarch, Arrian, and so on. He could put reproductions before you of coins and statues of the king which have survived and he could hand round to you a photograph of the Pompeian mosaic of the battle of Issus. Strictly speaking, however, all these documents only prove that earlier generations already believed in Alexander's existence and in the reality of his deeds, and your criticism might start afresh at that point. You would then discover that not all that has been reported about Alexander deserves credence or can be confirmed in its details; but nevertheless I cannot think that you would leave the lecture-room in doubts of the reality of Alexander the Great. Your decision would be determined essentially by two considerations: first, that the lecturer had no conceivable motive for assuring you of the reality of something he himself did not think real, and secondly, that all the available history books describe the events in approximately similar terms. If you went on to examine the older sources, you would take the same factors into account the possible motives of the informants and the conformity of the witnesses to one another. The outcome of your examination would undoubtedly be reassuring in the case of Alexander, but would probably be different where figures such as Moses or Nimrod were concerned. Later opportunities will bring to light clearly enough what doubts you may feel about the credibility of your psycho-analytic informant.

But you will have a right to ask another question. If there is no objective verification of psycho-analysis, and no possibility of demonstrating it, how can one learn psycho-analysis at all, and convince oneself of the truth of its assertions? It is true that psycho-analysis cannot easily be learnt and there are not many people who have learnt it properly. But of course there is a practicable method none the less. One learns psycho-analysis on oneself, by studying one's own personality. This is not quite the same thing as what is called self-observation, but it can, if necessary, be subsumed under it. There are a whole number of very common and generally familiar mental phenomena which, after a little instruction in technique, can be made the subject of analysis upon oneself. In that way one acquires the desired sense of conviction of the reality of the processes described by analysis and of the correctness of its views. Nevertheless, there are definite limits to progress by this method. One advances much further if one is analysed oneself by a practised analyst and experiences the effects of analysis on one's own self, making use of the opportunity of picking up the subtler technique of the process from one's analyst. This excellent method is, of course, applicable only to a single person and never to a whole lecture room of students together.

Psycho-analysis is not to be blamed for a second difficulty in your relation to it; I must make you yourselves responsible for it, Ladies and Gentlemen, at least in so far as you have been students of medicine. Your earlier education has given a particular direction to your thinking, which leads far away from psycho-analysis. You have been trained to find an anatomical basis for the functions of the organism and their disorders, to explain them chemically and physically and to view them biologically. But no portion of your interest has been directed to psychical life, in which, after all, the achievement of this marvellously complex organism reaches its peak. For that reason psychological modes of thought have remained foreign to you. You have grown accustomed to regarding them with suspicion, to denying them the attribute of being scientific, and to handing them over to laymen, poets, natural philosophers and mystics. This limitation is without doubt detrimental to your medical activity, since, as is the rule in all human relationships, your patients will begin by presenting you with their mental *façade*, and I fear that you will be obliged as a punishment to leave a part of the therapeutic influence you are seeking to the lay practitioners, nature curers and mystics whom you so much despise.

I am not unaware of the excuse that we have to accept for this defect in your education. No philosophical auxiliary science exists which could be made of service for your medical purposes. Neither speculative philosophy, nor descriptive psychology, nor what is called experimental psychology (which is closely allied to the physiology of the sense-organs), as they are taught in the Universities, are in a position to tell you anything serviceable of the relation between body and mind or to provide you with the key to an understanding of possible disturbances of the mental functions. It is true that psychiatry, as a part of medicine, sets about describing the mental disorders it observes and collecting them into clinical entities; but at favourable moments the psychiatrists themselves have doubts of whether their purely descriptive hypotheses deserve the name of a science. Nothing is known of the origin, the mechanism or the mutual relations of the symptoms of which these clinical entities are composed; there are either no observable changes in the anatomical organ of the mind to correspond to them, or changes which throw no light upon them. These mental disorders are only accessible to therapeutic influence when they can be recognized as subsidiary effects of what is otherwise an organic illness.

This is the gap which psycho-analysis seeks to fill. It tries to give psychiatry its missing psychological foundation. It hopes to discover the common ground on the basis of which the convergence of physical and mental disorder will become intelligible. With this aim in view, psycho-analysis must keep itself free from any hypothesis that is alien to it, whether of an anatomical, chemical or physiological kind, and must operate entirely with purely psychological auxiliary ideas; and for that very reason, I fear, it will seem strange to you to begin with.

I shall not hold you, your education or your attitude of mind responsible for the next difficulty. Two of the hypotheses of psycho-analysis are an insult to the entire world and have earned its dislike. One of them offends against an intellectual prejudice, the other against an aesthetic and moral one. We must not be too contemptuous of these prejudices; they are powerful things, precipitates of human developments that were useful and indeed essential. They are kept in existence by emotional forces and the struggle against them is hard.

The first of these unpopular assertions made by psycho-analysis declares that mental processes are in themselves unconscious and that of all mental life it is only certain individual acts and portions that are conscious. You know that on the contrary we are in the habit of identifying what is psychical with what is conscious. We look upon consciousness as nothing more nor less than the *defining* characteristic of the psychical, and psychology as the study of the contents of consciousness. Indeed it seems to us so much a matter of course to equate them in this way that any contradiction of the idea strikes us as obvious nonsense. Yet psycho-analysis cannot avoid raising this contradiction; it cannot accept the identity of the conscious and the mental. It defines what is mental as processes such as feeling, thinking and willing, and it is obliged to maintain that there is unconscious thinking and unapprehended willing. In saying this it has from the start frivolously forfeited the sympathy of every friend of sober scientific thought, and laid itself open to the suspicion of being a fantastic esoteric doctrine eager to make mysteries and fish in troubled waters. But you, Ladies and Gentlemen, naturally cannot understand as yet what right I have to describe as a prejudice a statement of so abstract a nature as 'what is mental is conscious'. Nor can you guess what development can have led to a denial of the unconscious - should such a thing exist - and what advantage there may have been in that denial. The question whether we are to make the psychical coincide with the conscious or make it extend further sounds like an empty dispute about words; yet I can assure you that the hypothesis of there being unconscious mental processes paves the way to a decisive new orientation in the world and in science.

You cannot have any notion, either, of what an intimate connection there is between this first piece of audacity on the part of psycho-analysis and the second one, which I must now tell you of. This second thesis, which psycho-analysis puts forward as one of its findings, is an assertion that instinctual impulses which can only be described as sexual, both in the narrower and wider sense of the word, play an extremely large and never hitherto appreciated part in the causation of nervous and mental diseases. It asserts further that these same sexual impulses also make contributions that must not be underestimated to the highest cultural, artistic and social creations of the human spirit.

In my experience antipathy to this outcome of psycho-analytic research is the most important source of resistance which it has met with. Would you like to hear how we explain that fact? We believe that civilization has been created under the pressure of the exigencies of life at the cost of satisfaction of the instincts; (and we believe that civilization is to a large extent being constantly created anew, since each individual who makes a fresh entry into human society repeats this sacrifice of instinctual satisfaction for the benefit of the whole community. Among the instinctual forces which are put to this use the sexual impulses play an important part; in this process they are sublimated - that is to say, they are diverted from their sexual aims and directed to others that are socially higher and no longer sexual. But this arrangement is unstable; the sexual instincts are imperfectly tamed, and, in the case of every individual who is supposed to join in the work of civilization, there is a risk that his sexual instincts may refuse to be put to that use. Society believes that no greater threat to its civilization could arise than if the sexual instincts were to be liberated and returned to their original aims. For this reason society does not wish to be reminded of this precarious portion of its foundations. It has no interest in the recognition of the strength of the sexual instincts or in the demonstration of the importance of sexual life to the individual. On the contrary, with an educational aim in view, it has set about diverting attention from that whole field of ideas. That is why it will not tolerate this outcome of psycho-analytic research and far prefers to stamp it as something aesthetically repulsive and morally reprehensible, or as something dangerous. But objections of this sort are ineffective against what claims to be an objective outcome of a piece of scientific work; if the contradiction is to come into the open it must be restated in intellectual terms. Now it is inherent in human nature to have an inclination to consider a thing untrue if one does not like it, and after that it is easy to find arguments against it. Thus society makes what is disagreeable into what is untrue. It disputes the truths of psycho-analysis with logical and factual arguments; but these arise from emotional sources and it maintains these objections as prejudices, against every attempt to counter them.

We, however, Ladies and Gentlemen, can claim that in asserting this controversial thesis we have had no tendentious aim in view. We have merely wished to give expression to a matter of fact which we believe we have established by our painstaking labours. We claim, too, the right to reject without qualification any interference by practical considerations in scientific work, even before we have enquired whether the fear which seeks to impose these considerations on us is justified or not.

Such, then, are a few of the difficulties that stand in the way of your interest in psycho-analysis. They are perhaps more than enough for a start. But if you are able to overcome the impression they make on you, we will proceed.

LECTURE II

PARAPRAXES

LADIES AND GENTLEMEN, - We will not start with postulates but with an investigation. Let us choose as its subject certain phenomena which are very common and very familiar but which have been very little examined, and which, since they can be observed in any healthy person, have nothing to do with illnesses. They are what are known as 'parapraxes', to which everyone is liable. It may happen, for instance, that a person who intends to say something may use another word instead (a *slip of the tongue* [*Versprechen*]), or he may do the same thing in writing, and may or may not notice what he has done. Or a person may read something, whether in print or manuscript, different from what is actually before his eyes (a *misreading* [*Verlesen*]), or he may hear wrongly something that has been said to him (a *mishearing* [*Verhören*]) - on the assumption, of course, that there is no organic disturbance of his powers of hearing. Another group of these phenomena has as its basis *forgetting* [*Vergessen*] - not, however, a permanent forgetting but only a temporary one. Thus a person may be unable to get hold of a *name* which he nevertheless knows and which he recognizes at once, or he may forget to carry out an *intention*, though he remembers it later and has thus only forgotten it at that particular moment. In a third group the temporary character is absent - for instance in the case of *mislaying* [*Verlegen*], when a person has put something somewhere and cannot find it again or in the precisely analogous case of *losing* [*Verlieren*]. Here we have a forgetting which we treat differently from other kinds of forgetting, one at which we are surprised or annoyed instead of finding it understandable. In addition to all this there are particular sorts of *errors* [*Irrtümer*], in which the temporary character is present once more; for in their instance we believe for a time that something is the case which both before and afterwards we know is not so. And there are a number of other similar phenomena known by various names.

All these are occurrences whose internal affinity with one another is expressed in the fact that [in German] they begin with the syllable 'ver'. They are almost all of an unimportant kind, most of them are very transitory, and they are without much significance in human life. Only rarely does one of them, such as losing an object, attain some degree of practical importance. For that reason, too, they attract little attention, give rise to no more than feeble emotions, and so on.

It is to these phenomena, then, that I now propose to draw your attention. But you will protest with some annoyance: 'There are so many vast problems in the wide universe, as well as within the narrower confines of our minds, so many marvels in the field of mental disorders, which require and deserve to have light thrown upon them, that it does really seem gratuitous to waste labour and interest on such trivialities. If you could make us understand why a person with sound eyes and ears can see and hear in broad daylight things that are not there, why another person suddenly thinks he is being persecuted by the people of whom he has hitherto been most fond, or puts forward the cleverest arguments in support of delusional beliefs which any child could see were nonsensical, then we should have some opinion of psycho-analysis. But if it can do no more than ask us to consider why a speaker at a banquet uses one word instead of another or why a housewife has mislaid her keys, and similar futilities, then we shall know how to put our time and interest to better uses.'

I should reply: Patience, Ladies and Gentlemen! I think your criticism has gone astray. It is true that psycho-analysis cannot boast that it has never concerned itself with trivialities. On the contrary, the material for its observations is usually provided by the inconsiderable events which have been put aside by the other sciences as being too unimportant - the dregs, one might say, of the world of phenomena. But are you not making a confusion in your criticism between the vastness of the problems and the conspicuousness of what points to them? Are there not very important things which can only reveal themselves, under certain conditions and at certain times, by quite feeble indications? I should find no difficulty in giving you several examples of such situations. If you are a young man, for instance, will it not be from small pointers that you will conclude that you have won a girl's favour? Would you wait for an express declaration of love or a passionate embrace? Or would not a glance, scarcely noticed by other people, be enough? a slight movement, the lengthening by a second of the pressure of a hand? And if you were a detective engaged in tracing a murder, would you expect to find that the murderer had left his photograph behind at the place of the crime, with his address attached? or would you not necessarily have to be satisfied with comparatively slight and obscure traces of the person you were in search of? So do not let us under-estimate small indications; by their help we may succeed in getting on the track of something bigger. Furthermore, I think like you that the great problems of the universe and of science have the first claim on our interest. But it is as a rule of very little use to form an express intention of devoting oneself to research into this or that great problem. One is then often at a loss to know the first step to take. It is more promising in scientific work to attack whatever is immediately before one and offers an opportunity for research. If one does so really thoroughly and without prejudice or preconception, and if one has luck, then, since everything is related to everything, including small things to great, one may gain access even from such unpretentious work to a study of the great problems. That is what I should say in order to retain your interest, when we deal with such apparent trivialities as the parapraxes of healthy people.

Let us now call in someone who knows nothing of psycho-analysis, and ask him how he explains such occurrences. His first reply will certainly be: 'Oh! that's not worth explaining: they're just small chance events.' What does the fellow mean by this? Is he maintaining that there are occurrences, however small, which drop out of the universal concatenation of events - occurrences which might just as well not happen as happen? If anyone makes a breach of this kind in the determinism of natural events at a single point, it means that he has thrown overboard the whole *Weltanschauung* of science. Even the *Weltanschauung* of religion, we may remind him, behaves much more consistently, since it gives an explicit assurance that no sparrow falls from the roof without God's special will. I think our friend will hesitate to draw the logical conclusion from his first reply; he will change his mind and say that after all when he comes to study these things he can find explanations of them. What is in question are small failures of functioning, imperfections in mental activity, whose determinants can be assigned. A man who can usually speak correctly may make a slip of the tongue (1) if he is slightly indisposed and tired, (2) if he is excited and (3) if he is too much occupied with other things. It is easy to confirm these statements. Slips of the tongue do really occur with particular frequency when one is tired, has a headache or is threatened with migraine. In the same circumstances proper names are easily forgotten. Some people are accustomed to recognize the approach of an attack of migraine when proper names escape them in this way. When we are excited, too, we often make mistakes over words - and over *things* as well, and a 'bungled action' follows. Intentions are forgotten and a quantity of other undesigned actions become noticeable if we are absent-minded - that is, properly speaking, if we are concentrated on something else. A familiar example of this absent-mindedness is the Professor in *Fliegende Blätter* who leaves his umbrella behind and takes the wrong hat because he is thinking about the problems he is going to deal with in his next book. All of us can recall from our own experience instances of how we can forget intentions we have formed and promises we have made because in the meantime we have had some absorbing experience.

This sounds quite reasonable and seems safe from contradiction, though it may not be very interesting, perhaps, and not what we expected. Let us look at these explanations of parapraxes more closely. The alleged preconditions for the occurrence of these phenomena are not all of the same kind. Being ill and disturbances of the circulation provide a physiological reason for the impairment of normal functioning; excitement, fatigue and distraction are factors of another sort, which might be described as psycho-physiological. These last admit of easy translation into theory. Both fatigue and distraction, and perhaps also general excitement, bring about a division of attention which may result in insufficient attention being directed to the function in question. If so, the function can be disturbed with especial ease, or carried out inaccurately. Slight illness or changes in the blood-supply to the central nervous organ can have the same effect, by influencing the determining factor, the division of attention, in a similar manner. In all these cases, therefore, it would be a question of the effects of a disturbance of attention, whether from organic or psychical causes.

This does not appear to promise much for our psycho-analytic interest. We might feel tempted to drop the subject. If, however, we examine the observations more closely, what we find does not tally entirely with this attention theory of parapraxes, or at least does not follow from it naturally. We discover that parapraxes of this kind and forgetting of this kind occur in people who are *not* fatigued or absent-minded or excited, but who are in all respects in their normal state - unless we choose to ascribe *ex post facto* to the people concerned, purely on account of their parapraxis, an excitement which, however, they themselves do not admit to. Nor can it be simply the case that a function is ensured by an increase in the attention directed upon it and endangered if that attention is reduced. There are a large number of procedures that one carries out purely automatically, with very little attention, but nevertheless performs with complete security. A walker, who scarcely knows where he is going, keeps to the right path for all that, and stops at his destination without having *gone astray* [*vergangen*]. Or at all events this is so as a rule. An expert pianist strikes the right keys without thinking. He may, of course, make an occasional mistake; but if automatic playing increased the danger of bungling, that danger would be at its greatest for a virtuoso, whose playing, as a result of prolonged practice, has become *entirely* automatic. We know, on the contrary, that many procedures are carried out with quite particular certainty if they are not the object of a specially high degree of attention, and that the mishap of a parapraxis is liable to occur precisely if special importance is attached to correct functioning and there has therefore certainly been no distraction of the necessary attention. It could be argued that this is the result of 'excitement', but it is difficult to see why the excitement should not on the contrary *increase* the attention directed to what is so earnestly intended. If by a slip of the tongue someone says the opposite of what he intends in an important speech or oral communication, it can scarcely be explained by the psycho-physiological or attention theory.

There are, moreover, a number of small subsidiary phenomena in the case of parapraxes, which we do not understand and on which the explanations so far given shed no light. For instance, if we have temporarily forgotten a name, we are annoyed about it, do all we can to remember it and cannot leave the business alone. Why in such cases do we so extremely seldom succeed in directing our attention, as we are after all anxious to do, to the word which (as we say) is 'on the tip of our tongue' and which we recognize at once when we are told it? Or again: there are cases in which the parapraxes multiply, form chains, and replace one another. On a first occasion one has missed an appointment. On the next occasion, when one has firmly decided not to forget *this* time, it turns out that one has made a note of the wrong hour. Or one tries to arrive at a forgotten word by roundabout ways and thereupon a second name escapes one which might have helped one to find the first. If one searches for this second name, a third disappears, and so on. As is well known, the same thing can happen with misprints, which are to be regarded as the parapraxes of the compositor. An obstinate misprint of this kind, so it is said, once slipped into a social-democrat newspaper. Its report of some ceremonial included the words: 'Among those present was to be noticed His Highness the *Kornprinz*.' Next day an attempt was made at a correction. The paper apologized and said: 'We should of course have said "the *Knorprinz*".'¹ People speak in such cases of a 'demon of misprints' or a 'type-setting fiend' - terms which at least go beyond any psycho-physiological theory of misprints.

¹ [What was intended was the '*Kronprinz* (Crown Prince)'. '*Korn*' means 'corn' and '*Knorr*' 'protuberance'.]

Perhaps you are familiar, too, with the fact that it is possible to *provoke* slips of the tongue, to produce them, as it were, by suggestion. An anecdote illustrates this. A stage neophyte had been cast for the important part in *Die Jungfrau von Orleans* of the messenger who announces to the King that 'der Connétable schickt sein Schwert zurück [the Constable sends back his sword]'. A leading actor amused himself during the rehearsal by repeatedly inducing the nervous young man to say, instead of the words of the text: 'der Komfortabel schickt sein Pferd zurück [the cab-driver sends back his horse].' He achieved his aim: the wretched beginner actually made his debut at the performance with the corrupt version, in spite of having been warned against it, or perhaps *because* he had been warned.

No light is thrown on these small features of parapraxes by the theory of withdrawal of attention. The theory need not on that account be wrong, however; it may merely lack something, some addition, before it is entirely satisfying. But some of the parapraxes, too, can themselves be looked at from another point of view.

Let us take *slips of the tongue* as the most suitable sort of parapraxis for our purpose - though we might equally well have chosen slips of the pen or misreading. We must bear in mind that so far we have only asked when - under what conditions - people make slips of the tongue, and it is only to that question that we have had an answer. But we might direct our interest elsewhere and enquire why it is that the slip occurred in this particular way and no other; and we might take into account what it is that emerges in the slip itself. You will observe that, so long as this question is unanswered and no light thrown on the product of the slip, the phenomenon remains a chance event from the psychological point of view, even though it may have been given a physiological explanation. If I make a slip of the tongue, I might obviously do so in an infinite number of ways, the right word might be replaced by any of a thousand others, it might be distorted in countless different directions. Is there something, then, that compels me in the particular case to make the slip in one special way, or does it remain a matter of chance, of arbitrary choice, and is the question perhaps one to which no sensible answer at all can be given?

Two writers, Meringer and Mayer (a philologist and a psychiatrist), in fact made an attempt in 1895 to attack the problem of parapraxes from this angle. They collected examples and began by treating them in a purely descriptive way. This, of course, provides no explanation as yet, though it might pave the way to one. They distinguish the various kinds of distortions imposed by the slip on the intended speech as 'transpositions', 'pre-sonances', 'post-sonances', 'fusions (contaminations)' and 'replacements (substitutions)'. I will give you some examples of these main groups proposed by the authors. An instance of transposition would be to say '*the Milo of Venus*' instead of 'the Venus of Milo' (a transposition of the order of the words); an instance of a pre-sonance would be: 'es war mir *auf der Schwest* . . . auf der Brust so schwer';¹ and a post-sonance would be exemplified by the well-known toast that went wrong: 'Ich fordere Sie *auf, auf* das Wohl unseres Chefs *aufzustossen*' [instead of *anzustossen*].² These three forms of slip of the tongue are not exactly common. You will come on much more numerous examples in which the slip results from contraction or fusion. Thus, for instance, a gentleman addressed a lady in the street in the following words: 'If you will permit me, madam, I should like to *begleit-digen* you.' The composite word,³ in addition to the '*begleiten* [to accompany]', evidently has concealed in it '*beleidigen* [to insult]'. (Incidentally, the young man was not likely to have much success with the lady.) As an example of a substitution Meringer and Mayer give the case of someone saying: 'Ich gebe die Präparate in den *Briefkasten*' instead of '*Brütkasten*'.⁴

¹ [The phrase intended was: 'it lay on my breast so heavily.' The meaningless '*Schwest*' was a distortion of '*Brust* (breast)' owing to an anticipation of the '*schw*' of '*schwer* (heavily)'.]

² ['I call on you to *hiccough*' (instead of 'drink to') 'the health of our Chief.']

³ [A meaningless one.]

⁴ ['I put the preparation into the letter-box' instead of 'incubator', literally, 'hatching-box'.]

The attempted explanation which these authors base on their collection of instances is quite peculiarly inadequate. They believe that the sounds and syllables of a word have a particular 'valency' and that the innervation of an element of high valency may have a disturbing influence on one that is less valent. Here they are clearly basing themselves on the far from common cases of pre-sonance and post-sonance; these preferences of some sounds over others (if they in fact exist) can have no bearing at all on other effects of slips of the tongue. After all, the commonest slips of the tongue are when, instead of saying one word, we say another very much like it; and this similarity is for many people a sufficient explanation of such slips. For instance, a Professor declared in his inaugural lecture: 'I am not *'geneigt* [inclined]' (instead of *'geeignet* [qualified]') to appreciate the services of my highly esteemed predecessor.' Or another Professor remarked: 'In the case of the female genitals, in spite of many *Versuchungen* [temptations] - I beg your pardon, *Versuche* [experiments]. . . .'

The most usual, and at the same time the most striking kind of slips of the tongue, however, are those in which one says the precise opposite of what one intended to say. Here, of course, we are very remote from relations between sounds and the effects of similarity; and instead we can appeal to the fact that contraries have a strong conceptual kinship with each other and stand in a particularly close psychological association with each other. There are historical examples of such occurrences. A President of the Lower House of our Parliament once opened the sitting with the words: 'Gentlemen, I take notice that a full quorum of members is present and herewith declare the sitting *closed*.'

Any other familiar association can act in the same insidious fashion as a contrary one, and can emerge in quite unsuitable circumstances. Thus, on the occasion of a celebration in honour of the marriage of a child of Hermann von Helmholtz to a child of Werner von Siemens, the well-known inventor and industrialist, it is said that the duty of proposing the young couple's health fell to the famous physiologist Du Bois-Reymond. No doubt he made a brilliant speech, but he ended with the words: 'So, long life to the new firm of Siemens and Halske!' That was, of course, the name of the *old* firm. The juxtaposition of the two names must have been as familiar to a Berliner as Fortnum and Mason would be to a Londoner.¹

We must therefore include among the causes of parapraxes not only relations between sounds and verbal similarity, but the influence of word-associations as well. But that is not all. In a number of cases it seems impossible to explain a slip of the tongue unless we take into account something that had been said, or even merely thought, in an earlier sentence. Once again, then, we have here a case of perseveration, like those insisted upon by Meringer, but of more distant origin. - I must confess that I feel on the whole as though after all this we were further than ever from understanding slips of the tongue.

¹ [In the original: 'as Riedel and Beutel would be to a Viennese'. This last was a well-known outfitter's shop in Vienna. Siemens and Halske were, of course, the great electrical engineers.]

Nevertheless I hope I am not mistaken in saying that during this last enquiry we have all of us formed a fresh impression of these instances of slips of the tongue, and that it may be worth while to consider that impression further. We examined the conditions under which in general slips of the tongue occur, and afterwards the influences which determine the kind of distortion which the slip produces. But we have so far paid no attention whatever to the *product* of the slip considered by itself, without reference to its origin. If we decide to do so, we are bound in the end to find the courage to say that in a few examples what results from the slip of the tongue has a sense of its own. What do we mean by 'has a sense'? That the product of the slip of the tongue may perhaps itself have a right to be regarded as a completely valid psychical act, pursuing an aim of its own, as a statement with a content and significance. So far we have always spoken of 'parapraxes', but it seems now as though sometimes the faulty act was itself quite a *normal* act, which merely took the place of the other act which was the one expected or intended.

The fact of the parapraxis having a sense of its own seems in certain cases evident and unmistakable. When the President of the Lower House with his first words *closed* the sitting instead of opening it, we feel inclined, in view of our knowledge of the circumstances in which the slip of the tongue occurred, to recognize that the parapraxis had a sense. The President expected nothing good of the sitting and would have been glad if he could have brought it to an immediate end. We have no difficulty in pointing to the sense of this slip of the tongue, or, in other words, in interpreting it. Or, let us suppose that one lady says to another in tones of apparent admiration: 'That smart new hat - I suppose you *aufgepatzt* [a non-existent word instead of *aufgeputzt* (trimmed)] it yourself?' Then no amount of scientific propriety will succeed in preventing our seeing behind this slip of the tongue the words: 'This hat is a *Patzerei* [botched-up affair].' Or, once more, we are told that a lady who was well-known for her energy remarked on one occasion: 'My husband asked his doctor what diet he ought to follow; but the doctor told him he had no need to diet: he could eat and drink what I want.' Here again the slip of the tongue has an unmistakable other side to it: it was giving expression to a consistently planned programme.

If it turned out, Ladies and Gentlemen, that not only *a few* instances of slips of the tongue and of parapraxes in general have a sense, but a considerable number of them, the *sense* of parapraxes, of which we have so far heard nothing, would inevitably become their most interesting feature and would push every other consideration into the background. We should then be able to leave all physiological or psycho-physiological factors on one side and devote ourselves to purely psychological investigations into the sense - that is, the meaning or purpose - of parapraxes. We shall therefore make it our business to test this expectation on a considerable number of observations.

But before carrying out this intention I should like to invite you to follow me along another track. It has repeatedly happened that a creative writer has made use of a slip of the tongue or some other parapraxis as an instrument for producing an imaginative effect. This fact alone must prove to us that he regards the parapraxis - the slip of the tongue, for instance - as having a sense, since he has produced it deliberately. For what has happened is not that the author has made an accidental slip of the pen and has then allowed it to be used by one of his characters as a slip of the tongue; he intends to bring something to our notice by means of the slip of the tongue and we can enquire what that something is - whether perhaps he wants to suggest that the character in question is absent-minded and fatigued or is going to have an attack of migraine. If the author uses the slip as though it had a sense, we have no wish, of course, to exaggerate the importance of this. After all, a slip might in fact be without a sense, a chance psychical event, or it might have a sense in only quite rare cases, but the author would still retain his right to intellectualize it by *furnishing* it with a sense so as to employ it for his own purposes. Nor would it be surprising if we had more to learn about slips of the tongue from creative writers than from philologists and psychiatrists.

QUESTENBERG Alas, alas! and stands it so?
What, friend! and do we let him go away
In this delusion - let him go away?
Not call him back immediately, not open
His eyes upon the spot?

OCTAVIO (*recovering himself out of a deep study*) He now has open'd mine,
And I see more than pleases me.

QUEST. What is it?

OCT. Curse on this journey!

QUEST. But why so? What is it?

OCT. Come, come along friend! I must follow up
The ominous track immediately. Mine eyes
Are open'd now, and I must use them. Come!
(Draws Q. on with him.)

QUEST. What now? Where go you then?

OCT. To her . . .

QUEST. To -

OCT. (*correcting himself*) To the Duke. Come let us go.

Octavio had meant to say 'to him', to the Duke. But he makes a slip of the tongue, and, by saying 'to her' he betrays to us at least that he has clearly recognized the influence that has made the young warrior into an enthusiast for peace.

A still more impressive example has been discovered by Otto Rank in Shakespeare. It is from *The Merchant of Venice*, in the famous scene in which the fortunate lover chooses between the three caskets, and perhaps I cannot do better than read you Rank's short account of it:

'A slip of the tongue occurs in Shakespeare's *Merchant of Venice* (Act III, Scene 2), which is from the dramatic point of view extremely subtly motivated and which is put to brilliant technical use. Like the slip in *Wallenstein* to which Freud has drawn attention, it shows that dramatists have a clear understanding of the mechanism and meaning of this kind of parapraxis and assume that the same is true of their audience. Portia, who by her father's will has been bound to the choice of a husband by lot, has so far escaped all her unwelcome suitors by a fortunate chance. Having at last found in Bassanio the suitor who is to her liking, she has cause to fear that he too will choose the wrong casket. She would very much like to tell him that even so he could rest assured of her love; but she is prevented by her vow. In this internal conflict the poet makes her say to the suitor she favours:

I pray you tarry; pause a day or two
 Before you hazard: for, in choosing wrong,
 I lose your company; therefore forbear a while:
 There's something tells me (*but it is not love*)
 I would not lose you
 I could teach you
 How to choose right, but then I am forsworn;
 So will I never be; so may you miss me;
 But if you do you'll make me wish a sin,
 That I have been forsworn. Beshrew your eyes,
 They have o'erlooked me, and divided me;
One half of me is yours, the other half is yours, -
Mine own, I would say, but if mine, then yours,
 And so all yours.

The thing of which she wanted to give him only a very subtle hint, because she should have concealed it from him altogether, namely, that even before he made his choice she was *wholly* his and loved him - it is precisely this that the poet, with a wonderful psychological sensitivity, causes to break through openly in her slip of the tongue; and by this artistic device he succeeds in relieving both the lover's unbearable uncertainty and the suspense of the sympathetic audience over the outcome of his choice.'

Observe, too, how skilfully Portia in the end reconciles the two statements contained in her slip of the tongue, how she solves the contradiction between them and yet finally shows that it was the slip that was in the right:

'But if mine, then yours,
 And so all yours.'

It has occasionally happened that a thinker whose field lies outside medicine has, by something he says, revealed the sense of a parapraxis and anticipated our efforts at explaining them. You all know of the witty satirist Lichtenberg (1742-99), of whom Goethe said: 'Where he makes a jest a problem lies concealed.' Sometimes the jest brings the *solution* of the problem to light as well. In Lichtenberg's *Witzige und Satirische Einfälle* [Witty and Satirical Thoughts] we find this: 'He had read so much Homer that he always read "*Agamemnon*" instead of "*angenommen* [supposed]".' Here we have the whole theory of misreading. We must see next time whether we can go along with these writers in their view of parapraxes.

LECTURE III

PARAPRAXES (*continued*)

LADIES AND GENTLEMEN, - We arrived last time at the idea of considering parapraxes not in relation to the intended function which they disturbed but on their own account; and we formed an impression that in particular cases they seemed to be betraying a sense of their own. We then reflected that if confirmation could be obtained on a wider scale that parapraxes have a sense, their sense would soon become more interesting than the investigation of the circumstances in which they come about.

Let us once more reach an agreement upon what is to be understood by the 'sense' of a psychical process. We mean nothing other by it than the intention it serves and its position in a psychical continuity. In most of our researches we can replace 'sense' by 'intention' or 'purpose'. Was it, then, merely a deceptive illusion or a poetic exaltation of parapraxes when we thought we recognized an intention in them?

We will continue to take slips of the tongue as our examples. If we now look through a considerable number of observations of that kind, we shall find whole categories of cases in which the intention, the sense, of the slip is plainly visible. Above all there are those in which what was intended is replaced by its contrary. The President of the Lower House said in his opening speech: 'I declare the sitting closed.' That is quite unambiguous. The sense and intention of his slip was that he wanted to close the sitting. 'Er sagt es ja selbst'¹ we are tempted to quote: we need only take him at his word. Do not interrupt me at this point by objecting that that is impossible, that we know that he did not want to close the sitting but to open it, and that he himself, whom we have just recognized as the supreme court of appeal, could confirm the fact that he wanted to open it. You are forgetting that we have come to an agreement that we will begin by regarding parapraxes on their own account; their relation to the intention which they have disturbed is not to be discussed till later. Otherwise you will be guilty of a logical error by simply evading the problem that is under discussion - by what is called in English 'begging the question'.

¹ ['He says so himself.']

In other cases, where the slip does not express the precise contrary, an opposite sense can nevertheless be brought out by it. 'I am not *geneigt* [inclined] to appreciate the services of my predecessor'. *Geneigt* is not the contrary of *geeignet* [qualified], but it expresses openly something which contrasts sharply with the situation in which the speech was to be made,

In yet other cases the slip of the tongue merely adds a second sense to the one intended. The sentence then sounds like a contraction, abbreviation or condensation of several sentences. Thus, when the energetic lady said: 'He can eat and drink what I want', it was just as though she had said: 'He can eat and drink what he wants; but what has *he* to do with wanting? *I* will want instead of him.' A slip of the tongue often gives the impression of being an abbreviation of this sort. For instance, a Professor of Anatomy at the end of a lecture on the nasal cavities asked whether his audience had understood what he said and, after general assent, went on: 'I can hardly believe that, since even in a city with millions of inhabitants, those who understand the nasal cavities can be counted *on one finger*. . . . I beg your pardon, on the fingers of one hand.' The abbreviated phrase has a sense too - namely, that there is only one person who understands them.

In contrast to these groups of cases, in which the parapraxis itself brings its sense to light, there are others in which the parapraxis produces nothing that has any sense of its own, and which therefore sharply contradict our expectations. If someone twists a proper name about by a slip of the tongue or puts an abnormal series of sounds together, these very common events alone seem to give a negative reply to our question whether all parapraxes have some sort of sense. Closer examination of such instances, however, shows that these distortions are easily understood and that there is by no means so great a distinction between these more obscure cases and the earlier straightforward ones.

A man who was asked about the health of his horse replied: 'Well, it *draut* [a meaningless word] . . . it *dauert* [will last] another month perhaps.' When he was asked what he had really meant to say, he explained that he had thought it was a '*traurige* [sad]' story. The combination of '*dauert*' and '*traurig*' had produced '*draut*'.¹

Another man, speaking of some occurrences he disapproved of, went on: 'But then facts came to *Vorschwein* [a non-existent word, instead of *Vorschein* (light)]. . . .' In reply to enquiries he confirmed the fact that he had thought these occurrences '*Schweinereien* ['disgusting', literally 'piggish']. '*Vorschein*' and '*Schweinereien*' combined to produce the strange word '*Vorschwein*'.²

You will recall the case of the young man who asked the unknown lady if he might '*begleitigden*' her. We ventured to divide up this verbal form into '*begleiten* [accompany]' and '*beleidigen* [insult]', and we felt certain enough of this interpretation not to need any confirmation of it. You will see from these examples that even these obscurer cases of slips of the tongue can be explained by a convergence, a mutual '*interference*', between two different intended speeches; the differences between these cases of slips arise merely from the fact that on some occasions one intention takes the place of the other completely (becomes a substitute for it), as in slips of the tongue that express the contrary, whereas on other occasions the one intention has to be satisfied with distorting or modifying the other, so that composite structures are produced, which make sense, to a greater or lesser degree, on their own account.

¹ Meringer and Mayer.

² Meringer and Mayer.

We seem now to have grasped the secret of a large number of slips of the tongue. If we bear this discovery in mind, we shall be able to understand other groups as well which have puzzled us hitherto. In cases of distortion of names, for instance, we cannot suppose that it is always a matter of competition between two similar but different names. It is not difficult, however to guess the second intention. The distortion of a name occurs often enough apart from slips of the tongue; it seeks to give the name an offensive sound or to make it sound like something inferior, and it is a familiar practice (or malpractice) designed as an insult, which civilized people soon learn to abandon, but which they are *reluctant* to abandon. It is still often permitted as a 'joke', though a pretty poor one. As a blatant and ugly example of this way of distorting names, I may mention that in these days the name of the President of the French Republic, Poincaré, has been changed into '*Schweinskarré*'.¹ It is therefore plausible to suppose that the same insulting intention is present in these slips of the tongue and is trying to find expression in the distortion of a name. Similar explanations suggest themselves along the same lines for certain instances of slips of the tongue with comic or absurd results. 'I call on you to hiccough [*aufzustossen*] to the health of our Chief.' Here a ceremonial atmosphere is unexpectedly disturbed by the intrusion of a word which calls up an unsavoury idea, and, on the model of certain insulting and offensive phrases, we can scarcely avoid a suspicion that a purpose was trying to find expression which was in violent contradiction to the ostensibly respectful words. What the slip seems to have been saying was something like: 'Don't you believe it! I don't mean this seriously! I don't care a rap for the fellow!' Just the same thing applies to slips of the tongue which turn innocent words into indecent or obscene ones: thus, '*Apopos*' for '*à propos*' or '*Eischeissweibchen*' for '*Eiweisscheibchen*'.²

Many people, as we know, derive some pleasure from a habit like this of deliberately distorting innocent words into obscene ones; such distortions are regarded as funny, and when we hear one we must in fact first enquire from the speaker whether he muttered it intentionally as a joke or whether it happened as a slip of the tongue.

¹ [The Viennese term for a pork chop.]

² Both from Meringer and Mayer. [In the first of these untranslatable examples '*Apopos*' is a non-existent word; but '*Popo*' is a nursery word for 'bottom'. In the second example the nonsense word means literally 'egg-shit-female', while the intended word means 'small slices of white of egg'.]

Well, it looks now as though we have solved the problem of parapraxes, and with very little trouble! They are not chance events but serious mental acts; they have a sense; they arise from the concurrent action - or perhaps rather, the mutually opposing action - of two different intentions. But now I see too that you are preparing to overwhelm me with a mass of questions and doubts which will have to be answered and dealt with before we can enjoy this first outcome of our work. I certainly have no desire to force hasty decisions upon you. Let us take them all in due order, one after the other, and give them cool consideration.

What is it you want to ask me? Do I think that this explanation applies to *all* parapraxes or only to a certain number? Can this same point of view be extended to the many other kinds of parapraxis, to misreading, slips of the pen, forgetting, bungled actions, mislaying, and so on? In view of the psychological nature of parapraxes, what significance remains for the factors of fatigue, excitement, absent-mindedness and interference with the attention? Further, it is clear that of the two competing purposes in a parapraxis one is always manifest, but the other not always. What do we do, then, in order to discover the latter? And, if we think we have discovered it, how do we prove that it is not merely a probable one but the only correct one? Is there anything else you want to ask? If not, I will go on myself. You will recall that we do not set much store by parapraxes themselves, and that all we want is to learn from studying them something that may be turned to account for psycho-analysis. I therefore put this question to you. What are these intentions or purposes which are able to disturb others in this way? And what are the relations between the disturbing purposes and the disturbed ones? Thus, no sooner is the problem solved than our work begins afresh.

First, then, is this the explanation of *all* cases of slips of the tongue? I am very much inclined to think so, and my reason is that every time one investigates an instance of a slip of the tongue an explanation of this kind is forthcoming. But it is also true that there is no way of proving that a slip of the tongue cannot occur without this mechanism. It may be so; but theoretically it is a matter of indifference to us, since the conclusions we want to draw for our introduction to psycho-analysis remain, even though - which is certainly not the case - our view holds good of only a minority of cases of slips of the tongue. The next question - whether we may extend our view to other sorts of parapraxis - I will answer in advance with a 'yes'. You will be able to convince yourselves of this when we come to examining instances of slips of the pen, bungled actions, and so on. But for technical reasons I suggest that we should postpone this task till we have treated slips of the tongue themselves still more thoroughly.

A more detailed reply is called for by the question of what significance remains for the factors put forward by the authorities - disturbances of the circulation, fatigue, excitement, absent-mindedness and the theory of disturbed attention - if we accept the psychical mechanism of slips of the tongue which we have described. Observe that we are not denying these factors. It is in general not such a common thing for psycho-analysis to *deny* something asserted by other people; as a rule it merely adds something new - though no doubt it occasionally happens that this thing that has hitherto been overlooked and is now brought up as a fresh addition is in fact the essence of the matter. The influence on the production of slips of the tongue by physiological dispositions brought about by slight illness, disturbances of the circulation or states of exhaustion, must be recognized at once; daily and personal experience will convince you of it. But how little they explain! Above all, they are not necessary preconditions of parapraxes. Slips of the tongue are just as possible in perfect health and in a normal state. These somatic factors only serve therefore, to facilitate and favour the peculiar mental mechanism of slips of the tongue. I once used an analogy to describe this relation, and I will repeat it here since I can think of none better to take its place. Suppose that one dark night I went to a lonely spot and was there attacked by a rough who took away my watch and purse. Since I did not see the robber's face clearly, I laid my complaint at the nearest police station with the words: 'Loneliness and darkness have just robbed me of my valuables.' The police officer might then say to me: 'In what you say you seem to be unjustifiably adopting an extreme mechanistic view. It would be better to represent the facts in this way: "Under the shield of darkness and favoured by loneliness, an unknown thief robbed you of your valuables."' In your case the essential task seems to me to be that we should find the thief. Perhaps we shall then be able to recover the booty.'

Such psycho-physiological factors as excitement, absent-mindedness and disturbances of attention will clearly help us very little towards an explanation. They are only empty phrases, screens behind which we must not let ourselves be prevented from having a look. The question is rather what it is that has been brought about here by the excitement, the particular distracting of attention. And again, we must recognize the importance of the influence of sounds, the similarity of words and the familiar associations aroused by words. These facilitate slips of the tongue by pointing to the paths they can take. But if I have a path open to me, does that fact automatically decide that I shall take it? I need a motive in addition before I resolve in favour of it and furthermore a force to propel me along the path. So these relations of sounds and words are also, like the somatic dispositions, only things that *favour* slips of the tongue and cannot provide the true explanation of them. Only consider: in an immense majority of cases my speech is not disturbed by the circumstance that the words I am using recall others with a similar sound, that they are intimately linked with their contraries or that familiar associations branch off from them. Perhaps we might still find a way out by following the philosopher Wundt, when he says that slips of the tongue arise if, as a result of physical exhaustion, the inclination to associate gains the upper hand over what the speaker otherwise intends to say. That would be most convincing if it were not contradicted by experience, which shows that in one set of cases the *somatic* factors favouring slips of the tongue are absent and in another set of cases the *associative* factors favouring them are equally absent.

I am particularly interested, however, in your next question: how does one discover the two mutually interfering purposes? You do not realize, probably, what a momentous question this is. One of the two, the purpose that is disturbed, is of course unmistakable: the person who makes the slip of the tongue knows it and admits to it. It is only the other, the disturbing purpose, that can give rise to doubt and hesitation. Now, we have already seen, and no doubt you have not forgotten, that in a number of cases this other purpose is equally evident. It is indicated by the *outcome* of the slip, if only we have the courage to grant that outcome a validity of its own. Take the President of the Lower House, whose slip of the tongue said the contrary of what he intended. It is clear that he wanted to open the sitting, but it is equally clear that he also wanted to close it. That is so obvious that it leaves us nothing to interpret. But in the other cases, in which the disturbing purpose only *distorts* the original one without itself achieving complete expression, how do we arrive at the disturbing purpose from the distortion?

In a first group of cases this is done quite simply and securely - in the same way, in fact, as with the *disturbed* purpose. We get the speaker to give us the information directly. After his slip of the tongue he at once produces the wording which he originally intended: 'It *draut* . . . no, it *dauert* [will last] another month perhaps.' Well, in just the same way we get him to tell us the *disturbing* purpose. 'Why', we ask him, 'did you say "*draut*?' He replies: 'I wanted to say "It's a *traurige* [sad] story".' Similarly, in the other case, where the slip of the tongue was '*Vorschwein*', the speaker confirms the fact that he had wanted at first to say 'It's a *Schweinerei* [disgusting]', but had controlled himself and gone off into another remark. Here then the distorting purpose is as securely established as the distorted one. My choice of these examples has not been unintentional, for their origin and solution come neither from me nor from any of my followers. And yet in both these cases active measures of a kind were necessary in order to bring about the solution. The speaker had to be asked why he had made the slip and what he could say about it. Otherwise he might perhaps have passed over his slip without wanting to explain it. But when he was asked he gave the explanation with the first thing that occurred to him. And now please observe that this small active step and its successful outcome are already a psycho-analysis and are a model for every psycho-analytic investigation which we shall embark upon later.

Am I too mistrustful, however, if I suspect that at the very moment at which psycho-analysis makes its appearance before you resistance to it simultaneously raises its head? Do you not feel inclined to object that the information given by the person of whom the question was asked - the person who made the slip of the tongue - is not completely conclusive? He was naturally anxious, you think, to fulfil the request to explain the slip, so he said the first thing that came into his head which seemed capable of providing such an explanation. But that is no proof that the slip did in fact take place in that way. It *may* have been so, but it may just as well have happened otherwise. And something else might have occurred to him which would have fitted in as well or perhaps even better.

It is strange how little respect you have at bottom for a psychical fact! Imagine that someone had undertaken the chemical analysis of a certain substance and had arrived at a particular weight for one component of it - so and so many milligrams. Certain inferences could be drawn from this weight. Now do you suppose that it would ever occur to a chemist to criticize those inferences on the ground that the isolated substance might equally have had some other weight? Everyone will bow before the fact that this was the weight and none other and will confidently draw his further inferences from it. But when you are faced with the psychical fact that a particular thing occurred to the mind of the person questioned, you will not allow the fact's validity: something else might have occurred to him! You nourish the illusion of there being such a thing as psychical freedom, and you will not give it up. I am sorry to say I disagree with you categorically over this.

You will break off at that, but only to take up your resistance again at another point. You proceed: 'It is the special technique of psycho-analysis, as we understand, to get people under analysis themselves to produce the solution of their problems. Now let us take another example - the one in which a speaker proposing the toast of honour on a ceremonial occasion called on his audience to hiccough [*aufzustossen*] to the health of the Chief. You say that the disturbing intention in this case was an insulting one: that was what was opposing the speaker's expression of respect. But this is pure interpretation on your part, based upon observations apart from the slip of the tongue. If in this instance you were to question the person responsible for the slip, he would not confirm your idea that he intended an insult; on the contrary, he would energetically repudiate it. Why, in view of this clear denial, do you not abandon your unprovable interpretation?'

Yes. You have lighted on a powerful argument this time. I can imagine the unknown proposer of the toast. He is probably a subordinate to the Chief of the Department who is being honoured - perhaps he himself is already an Assistant Lecturer, a young man with excellent prospects in life. I try to force him to admit that he may nevertheless have had a feeling that there was something in him opposing his toast in honour of the Chief. But this lands me in a nice mess. He gets impatient and suddenly breaks out: 'Just you stop trying to cross-question me or I shall turn nasty. You're going to ruin my whole career with your suspicions. I simply said "*aufstossen* [hiccough to]" instead of "*anstossen* [drink to]" because I'd said "*au!*" twice before in the same sentence. That's what Meringer calls a perseveration and there's nothing more to be interpreted about it. D'you understand? *Basta!*' - H'm! That was a surprising reaction, a truly energetic denial. I see there's nothing more to be done with the young man. But I also reflect that he shows a strong personal interest in insisting on his parapraxis not having a sense. You may also feel that there was something wrong in his being quite so rude about a purely theoretical enquiry. But, you will think, when all is said and done he must know what he wanted to say and what he didn't.

But must he? Perhaps that may still be the question.

Now, however, you think you have me at your mercy. 'So that's your technique', I hear you say. 'When a person who has made a slip of the tongue says something about it that suits you, you pronounce him to be the final decisive authority on the subject. "He says so himself!". But when what he says doesn't suit your book, then all at once you say he's of no importance - there's no need to believe him.

That is quite true. But I can put a similar case to you in which the same monstrous event occurs. When someone charged with an offence confesses his deed to the judge, the judge believes his confession; but if he denies it, the judge does not believe him. If it were otherwise, there would be no administration of justice, and in spite of occasional errors we must allow that the system works.

'Are you a judge, then? And is a person who has made a slip of the tongue brought up before you on a charge? So making a slip of the tongue is an offence, is it?'

Perhaps we need not reject the comparison. But I would ask you to observe what profound differences of opinion we have reached after a little investigation of what seemed such innocent problems concerning the parapraxes - differences which at the moment we see no possible way of smoothing over. I propose a provisional compromise on the basis of the analogy with the judge and the defendant. I suggest that you shall grant me that there can be no doubt of a parapraxis having a sense if the subject himself admits it. / I will admit in return that we cannot arrive at a direct proof of the suspected sense if the subject refuses us information, and equally, of course, if he is not at hand to give us the information. Then, as in the case of the administration of justice, we are obliged to turn to circumstantial evidence, which may make a decision more probable in some instances and less so in others. In the law courts it may be necessary for practical purposes to find a defendant guilty on circumstantial evidence. We are under no such necessity; but neither are we obliged to disregard the circumstantial evidence. It would be a mistake to suppose that a science consists entirely of strictly proved theses, and it would be unjust to require this. Only a disposition with a passion for authority will raise such a demand, someone with a craving to replace his religious catechism by another, though it is a scientific one. Science has only a few apodeictic propositions in its catechism: the rest are assertions promoted by it to some particular degree of probability. It is actually a sign of a scientific mode of thought to find satisfaction in these approximations to certainty and to be able to pursue constructive work further in spite of the absence of final confirmation.

¹ [The German words are on the same pattern: '*Versprechen*' and '*Vergehen*'.]

But if the subject does not himself give us the explanation of the sense of a parapraxis, where are we to find the starting-points for our interpretation - the circumstantial evidence? In various directions. In the first place from analogies with phenomena apart from parapraxes: when, for instance, we assert that distorting a name when it occurs as a slip of the tongue has the same insulting sense as a deliberate twisting of a name. Further, from the psychical situation in which the parapraxis occurs, the character of the person who makes the parapraxis, and the impressions which he has received before the parapraxis and to which the parapraxis is perhaps a reaction. What happens as a rule is that the interpretation is carried out according to general principles: to begin with there is only a suspicion, a suggestion for an interpretation, and we then find a confirmation by examining the psychical situation. Sometimes we have to wait for subsequent events as well (which have, as it were, announced themselves by the parapraxis) before our suspicion is confirmed.

I cannot easily give you illustrations of this if I limit myself to the field of slips of the tongue, though even there some good instances are to be found. The young man who wanted to '*begleitdigen*' a lady was certainly a timid character. The lady whose husband could eat and drink what *she* wanted is known to me as one of those energetic women who wear the breeches in their home. Or let us take the following example: At the General Meeting of the 'Concordia' a young member made a speech of violent opposition, in the course of which he addressed the committee as '*Vorschussmitglieder* [lending members]', a word which seems to be made up of '*Vorstand* [directors]' and '*Ausschuss* [committee]'. We shall suspect that some disturbing purpose was at work in him, acting against his violent opposition, based on something connected with a loan. And in fact we learnt from our informant that the speaker was constantly in financial difficulties and just at that time had applied for a loan. The disturbing intention could therefore be replaced by the thought: 'Moderate your opposition; these are the same people who will have to sanction your loan.'

But I can give you a large selection of circumstantial evidence of this kind if I pass over to the wide field of the other parapraxes.

If anyone forgets a proper name which is familiar to him normally or if, in spite of all his efforts, he finds it difficult to keep it in mind, it is plausible to suppose that he has something against the person who bears the name so that he prefers not to think of him. Consider, for instance, what we learn in the following cases about the psychical situation in which the parapraxis occurred.

'A Herr Y. fell in love with a lady, but he met with no success, and shortly afterwards she married a Herr X. Thereafter, Herr Y., in spite of having known Herr X. for a long time and even having business dealings with him, forgot his name over and over again, so that several times he had to enquire what it was from other people when he wanted to correspond with Herr X.' Herr Y. evidently wanted to know nothing of his more fortunate rival: 'never thought of shall he be.'¹

Or: A lady enquired from her doctor for news of a common acquaintance, but called her by her maiden name. She had forgotten her friend's married name. She admitted afterwards that she had been very unhappy about the marriage and disliked her friend's husband.²

We shall have a good deal to say about forgetting names in other connections; for the moment we are principally interested in the psychical situation in which the forgetting occurs.

The forgetting of intentions can in general be traced to an opposing current of thought, which is unwilling to carry out the intention. But this view is not only held by us psycho-analysts; it is the general opinion, accepted by everyone in their daily lives and only denied when it comes to theory. A patron who gives his *protégé* the excuse of having forgotten his request fails to justify himself. The *protégé* immediately thinks: 'It means nothing to him; it's true he promised, but he doesn't really want to do it.' For that reason forgetting is banned in certain circumstances of ordinary life; the distinction between the popular and the psycho-analytic view of these parapraxes seems to have disappeared. Imagine the lady of the house receiving her guest with the words: 'What? have you come to-day? I'd quite forgotten I invited you for to-day.' Or imagine a young man confessing to his *fiancée* that he had forgotten to keep their last *rendez-vous*. He will certainly not confess it; he will prefer to invent on the spur of the moment the most improbable obstacles which prevented his appearing at the time and afterwards made it impossible for him to let her know. We all know too that in military affairs the excuse of having forgotten something is of no help and is no protection against punishment, and we must all feel that that is justified. Here all at once everyone is united in thinking that a particular parapraxis has a sense and in knowing what that sense is. Why are they not consistent enough to extend this knowledge to the other parapraxes and to admit them fully? There is of course an answer to this question too.

¹ From Jung.

² From Brill.

Since laymen have so little doubt about the sense of this forgetting of intentions, you will be the less surprised to find writers employing this sort of parapraxis in the same sense. Any of you who have seen or read Bernard Shaw's *Caesar and Cleopatra* will remember that in the last scene Caesar, as he is leaving Egypt, is haunted by the idea that there is something else he had intended to do but has forgotten. In the end it turns out what this was: he had forgotten to say good-bye to Cleopatra. The dramatist is seeking by this little contrivance to ascribe to the great Caesar a superiority which he did not in fact possess and which he never desired. For historical sources will tell you that Caesar made Cleopatra follow him to Rome, that she was living there with her little Caesarion when Caesar was murdered, and that she thereupon fled from the city.

Cases of forgetting an intention are in general so clear that they are not of much use for our purpose of obtaining circumstantial evidence of the sense of a parapraxis from the psychical situation. Let us therefore turn to a particularly ambiguous and obscure kind of parapraxis - to losing and mislaying. You will no doubt find it incredible that we ourselves can play an intentional part in what is so often the painful accident of losing something. But there are plenty of observations like the following one. A young man lost a pencil of his of which he had been very fond. The day before, he had received a letter from his brother-in-law which ended with these words: 'I have neither the inclination nor the time at present to encourage you in your frivolity and laziness.' The pencil had actually been given to him by this brother-in-law. Without this coincidence we could not, of course, have asserted that a part was played in the loss by an intention to get rid of the thing.¹ Similar cases are very common. We lose an object if we have quarrelled with the person who gave it to us and do not want to be reminded of him; or if we no longer like the object itself and want to have an excuse for getting another and better one instead. The same intention directed against an object can also play a part, of course, in cases of dropping, breaking or destroying things. Can we regard it as a matter of chance when a schoolchild immediately before his birthday loses, ruins or smashes some of his personal belongings, such as his satchel or his watch?

Nor will anyone who has sufficiently often experienced the torment of not being able to find something that he himself has put away feel inclined to believe that there is a purpose in mislaying things. Yet instances are far from rare in which the circumstances attendant on the mislaying point to an intention to get rid of the object temporarily or permanently.

¹ From Dattner.

Here is the best example, perhaps, of such an occasion. A youngish man told me the following story: 'Some years ago there were misunderstandings between me and my wife. I found her too cold, and although I willingly recognized her excellent qualities we lived together without any tender feelings. One day, returning from a walk, she gave me a book which she had bought because she thought it would interest me. I thanked her for this mark of "attention", promised to read the book and put it on one side. After that I could never find it again. Months passed by, in which I occasionally remembered the lost book and made vain attempts to find it. About six months later my dear mother, who was not living with us, fell ill. My wife left home to nurse her mother-in-law. The patient's condition became serious and gave my wife an opportunity of showing the best side of herself. One evening I returned home full of enthusiasm and gratitude for what my wife had accomplished. I walked up to my desk, and without any definite intention but with a kind of somnambulistic certainty opened one of the drawers. On the very top I found the long-lost book I had mislaid. With the extinction of the motive the mislaying of the object ceased as well.

Ladies and Gentlemen, I could multiply this collection of examples indefinitely; but I will not do so here. You will in any case find a profusion of case material for the study of parapraxes in my *Psychopathology of Everyday Life* (first published in 1901).¹ All these examples lead to the same result: they make it probable that parapraxes have a sense, and they show you how that sense is discovered or confirmed by the attendant circumstances. I will be briefer to-day, because we have adopted the limited aim of using the study of these phenomena as a help towards a preparation for psycho-analysis. There are only two groups of observations into which I need enter more fully here: accumulated and combined parapraxes and the confirmation of our interpretations by subsequent events.

¹ See also similar collections by Maeder (in French), Brill (in English), Jones (in English) and J. Stårcke (in Dutch), etc.

Accumulated and combined parapraxes are without doubt the finest flower of their kind. If we had only been concerned to prove that parapraxes have a sense we should have confined ourselves to them from the first, for in their case the sense is unmistakable even to the dull-witted and forces itself on the most critical judgement. An accumulation of these phenomena betrays an obstinacy that is scarcely ever a characteristic of chance events but fits in well with something intentional. Finally, the mutual interchangeability between different species of parapraxes demonstrates what it is in parapraxes that is important and characteristic: not their form or the method which they employ but the purpose which they serve and which can be achieved in the most various ways. For this reason I will give you an instance of repeated forgetting. Ernest Jones tells us that once, for reasons unknown to him, he left a letter lying on his desk for several days. At last he decided to send it off, but he had it returned to him by the Dead Letter Office¹ since he had forgotten to address it. After he had addressed it he took it to the post, but this time it had no stamp. And then at last he was obliged to admit his reluctance to sending the letter off at all.

In another case a bungled action is combined with an instance of mislaying. A lady travelled to Rome with her brother-in-law, who was a famous artist. The visitor was received with great honour by the German community in Rome, and among other presents he was given an antique gold medal. The lady was vexed that her brother-in-law did not appreciate the lovely object sufficiently. When she returned home (her place in Rome having been taken by her sister) she discovered while unpacking that she had brought the medal with her - how, she did not know. She at once sent a letter with the news to her brother-in-law, and announced that she would send the article she had walked off with back to Rome next day. But next day the medal had been so cleverly mislaid that it could not be found and sent off; and it was at this point, that the meaning of her 'absent-mindedness' dawned on the lady: she wanted to keep the object for herself.²

¹ [In English in the original.]

² Reported by R. Reitler.

I have already given you an example of a combination of a forgetting with an error, the case of someone forgetting an appointment and on a second occasion, having firmly decided not to forget *this* time, turning up at the wrong hour. An exactly similar case was reported to me from his own experience by a friend with literary as well as scientific interests. 'Some years ago', he told me, 'I allowed myself to be elected to the committee of a certain literary society, as I thought that the organization might one day be able to help me to have my play produced; and I took a regular part, though without being much interested, in the meetings which were held every Friday. Then, a few months ago, I was given the promise of a production at the theatre at F.; and since then I have regularly *forgotten* the meetings of the society. When I read your book on the subject I felt ashamed of my forgetfulness. I reproached myself with the thought that it was shabby behaviour on my part to stay away now that I no longer needed these people, and resolved on no account to forget the next Friday. I kept on reminding myself of this resolution until I carried it into effect and stood at the door of the room where the meetings were held. To my astonishment it was locked; the meeting was over. I had in fact made a mistake over the day; it was now Saturday!'

It would be agreeable to add further, similar examples. But I must proceed, and give you a glimpse of the cases in which our interpretation has to wait for the future for confirmation. The governing condition of these cases, it will be realized, is that the present psychical situation is unknown to us or inaccessible to our enquiries. Our interpretation is consequently no more than a suspicion to which we ourselves do not attach too much importance. Later, however, something happens which shows us how well-justified our interpretation had been. I was once the guest of a young married couple and heard the young woman laughingly describe her latest experience. The day after her return from the honeymoon she had called for her unmarried sister to go shopping with her as she used to do, while her husband went to his business. Suddenly she noticed a gentleman on the other side of the street, and nudging her sister had cried: 'Look, there goes Herr L.' She had forgotten that this gentleman had been her husband for some weeks. I shuddered as I heard the story, but I did not dare to draw the inference. The little incident only occurred to my mind some years later when the marriage had come to a most unhappy end.

Maeder tells of a lady who, on the eve of her wedding had forgotten to try on her wedding-dress and, to her dressmaker's despair, only remembered it late in the evening. He connects this forgetfulness with the fact that she was soon divorced from her husband. I know a lady now divorced from her husband, who in managing her money affairs frequently signed documents in her maiden name, many years before she in fact resumed it. - I know of other women who have lost their wedding-rings during the honeymoon, and I know too that the history of their marriages has given a sense to the accident. - And now here is one more glaring example, but with a happier ending. The story is told of a famous German chemist that his marriage did not take place, because he forgot the hour of his wedding and went to the laboratory instead of to the church. He was wise enough to be satisfied with a single attempt and died at a great age unmarried.

The idea may possibly have occurred to you that in these examples parapraxes have taken the place of the omens or auguries of the ancients. And indeed some omens were nothing else than parapraxes, as, for instance, when someone stumbled or fell down. Others of them, it is true, had the character of objective happenings and not of subjective acts. But you would hardly believe how difficult it sometimes is to decide whether a particular event belongs to the one group or to the other. An act so often understands how to disguise itself as a passive experience.

All those of us who can look back on a comparatively long experience of life will probably admit that we should have spared ourselves many disappointments and painful surprises if we had found the courage and determination to interpret small parapraxes experienced in our human contacts as auguries and to make use of them as indications of intentions that were still concealed. As a rule we dare not do so; it would make us feel as though, after a detour through science, we were becoming superstitious again. Nor do all auguries come true, and you will understand from our theories that they do not all need to come true.

LECTURE IV

PARAPRAXES (*concluded*)

LADIES AND GENTLEMEN, - We may take it as the outcome of our efforts so far and the basis of our further investigations that parapraxes have a sense. Let me insist once again that I am not asserting - and for our purposes there is no need to do so - that every single parapraxis that occurs has a sense, even though I regard that as probably the case. It is enough for us if we can point to such a sense relatively often in the different forms of parapraxis. Moreover, in this respect these different forms behave differently. Cases of slips of the tongue and of the pen, etc., may occur on a purely physiological basis. I cannot believe that this is so in the types depending on *forgetting* (forgetting names or intentions, mislaying, etc.). It is very probable that there are cases of *losing* which can be regarded as unintended. It is in general true that only a certain proportion of the *errors* that occur in ordinary life can be looked at from our point of view. You should bear these limitations in mind when henceforward we start from the assumption that parapraxes are psychical acts and arise from mutual interference between two intentions.

This is the first product of psycho-analysis. Psychology has hitherto known nothing of the occurrence of such mutual interferences or of the possibility that they might result in such phenomena. We have made a quite considerable extension to the world of psychical phenomena and have won for psychology phenomena which were not reckoned earlier as belonging to it.

Let us pause a moment longer over the assertion that parapraxes are 'psychical acts'. Does this imply more than what we have said already - that they have a sense? I think not. I think, rather, that the former assertion is more indefinite and more easily misunderstood. Anything that is observable in mental life may occasionally be described as a mental phenomenon. The question will then be whether the particular mental phenomenon has arisen immediately from somatic, organic and material influences - in which case its investigation will not be part of psychology - or whether it is derived in the first instance from other mental processes, somewhere behind which the series of organic influences begins. It is this latter situation that we have in view when we describe a phenomenon as a mental process, and for that reason it is more expedient to clothe our assertion in the form: 'the phenomenon has a sense.' By 'sense' we understand 'meaning', 'intention', 'purpose' and 'position in a continuous psychical context'.

There are a number of other phenomena which are closely akin to parapraxes but to which that name is no longer appropriate. We call them chance and symptomatic actions. Like the others, they have the character of being without a motive, insignificant and unimportant; but they have in addition, more clearly, that of being unnecessary. They are distinguished from parapraxes by their lack of another intention with which they are in collision and which is disturbed by them. On the other hand, they merge insensibly into the gestures and movements which we regard as expressions of the emotions. These chance actions include all sorts of manipulations with our clothing, or parts of our body or objects within our reach, performed as though in play and apparently with no purpose, or, again, the omission of these manipulations; or, further, tunes that we hum to ourselves. I suggest that all these phenomena have a sense and can be interpreted in the same way as parapraxes, that they are small indications of more important mental processes and are fully valid psychical acts. But I do not propose to linger over this fresh extension of the field of mental phenomena; I shall return to the parapraxes, in connection with which problems important for psycho-analysis can be worked out with far greater clarity.

The most interesting questions which we have raised about parapraxes and not yet answered are perhaps these. We have said that parapraxes are the product of mutual interference between two different intentions, of which one may be called the disturbed intention and the other the disturbing one. The disturbed intentions give no occasion for further questions, but concerning the latter we should like to know, first, what sort of intentions emerge as a disturbance to others, and secondly what is the relation of the disturbing intentions to the disturbed ones?

If you will allow me, I will once more take slips of the tongue as representatives of the whole class and I will reply to the second question before the first.

In a slip of the tongue the disturbing intention may be related in its content to the disturbed one, in which case it will contradict it or correct it or supplement it. Or - the more obscure and more interesting case - the content of the disturbing intention may have nothing to do with that of the disturbed one.

We shall have no difficulty in finding evidence of the former relation in instances we already know and in similar ones. In almost every case in which a slip of the tongue reverses the sense, the disturbing intention expresses the contrary to the disturbed one and the parapraxis represents a conflict between two incompatible inclinations. 'I declare the sitting opened, but I should prefer it to be already closed' is the sense of the President's slip of the tongue. A political periodical which had been accused of corruption defended itself in an article the climax of which should have been: 'Our readers will bear witness to the fact that we have always acted in the most *unself-seeking* manner for the good of the community.' But the editor entrusted with the preparation of the article wrote 'in the most *self-seeking* manner'. That is to say, he was thinking: 'This is what I am obliged to write; but I have different ideas.' A member of parliament who was insisting that the truth should be told to the Emperor '*rückhaltlos* [unreservedly]' evidently heard an inner voice that was shocked at his boldness and, by a slip of the tongue, changed the word into '*rückgratlos* [spinelessly]'.¹

In the instances already familiar to you which give an impression of being contractions or abbreviations, what we have before us are corrections, additions or continuations, by means of which a second purpose makes itself felt alongside of the first. 'Facts came to *Vorschein* [light] - better to say it straight out - they were *Schweinereien* [disgusting]; well then, facts came to *Vorschwein*.' 'Those who understand this can be counted *on the fingers of one hand* - no, there's really only *one* person who understands it, so: can be counted *on one finger*.' Or: 'My husband can eat and drink what he wants. But, as you know, *I* don't put up with his wanting anything at all, so: he can eat and drink what *I* want.' In all these cases, then, the slip of the tongue arises from the content of the disturbed intention itself or is connected with it.

¹ This was in the German Reichstag in November 1908.

The other sort of relation between the two mutually interfering intentions seems puzzling. If the disturbing intention has nothing to do with the disturbed one, where can it have come from and why is it that it makes itself noticeable as a disturbance at this particular point? The observation which can alone give us the answer to this shows that the disturbance arises from a train of thought which has occupied the person concerned a short time before and, whether it has already been expressed in speech or not, produces this subsequent effect. It must in fact, therefore, be described as a perseveration, though not necessarily as the perseveration of spoken words. In this case too an associative link between the disturbing and the disturbed intentions is present; but it does not lie in their content but is artificially constructed, often along extremely forced associative paths.

Here is a simple example of this, derived from my own observation. I once met two Viennese ladies in the lovely Dolomites, who were dressed in walking clothes. I accompanied them part of the way, and we discussed the pleasures and also the trials of spending a holiday in that way. One of the ladies admitted that spending the day like that entailed a good deal of discomfort. 'It is certainly not at all pleasant', she said, 'if one has been tramping all day in the sun and has perspired right through one's blouse and chemise.' In this sentence she had to overcome a slight hesitation at one point. Then she continued: 'But then when one gets "nach *Hose*" and can change. . . .' This slip of the tongue was not analysed but I expect you can understand it easily. The lady's intention had obviously been to give a more complete list of her clothes: blouse, chemise and *Hose* [drawers]. Reasons of propriety led her to omit any mention of the '*Hose*'. But in the next sentence, with its quite independent content, the unspoken word emerged as a distortion of the similar-sounding '*nach Hause* [home]'.

We can now turn, however, to the main question, which we have long postponed, of what sort of intentions these are, which find expression in this unusual fashion as disturbers of other intentions. Well, they are obviously of very different sorts, among which we must look for the common factor. If we examine a number of examples with this in view, they will soon fall into three groups. The first group contains those cases in which the disturbing purpose is known to the speaker and moreover had been noticed by him before he made the slip of the tongue. Thus, in the '*Vorschwein*' slip the speaker admitted not only that he had formed the judgement '*Schweinereien*' about the events in question, but also that he had had the intention, from which he afterwards drew back, of expressing his judgement in words. A second group is made up of other cases in which the disturbing purpose is equally recognized as his by the speaker, but in which he was unaware that it was active in him just before he made the slip. Thus, he accepts our interpretation of his slip, but nevertheless remains to some extent surprised at it. Instances of this kind of attitude can perhaps be found in other sorts of parapraxes more easily than in slips of the tongue. In a third group the interpretation of the disturbing intention is vigorously rejected by the speaker; he not only denies that it was active in him before he made the slip, but seeks to maintain that it is entirely foreign to him. You will recall the example of the 'hiccough' and the positively rude denial which I brought on myself from the speaker by uncovering his disturbing intention. As you know, we have not yet come to any agreement in our views on these cases. I should pay no attention to the denial put forward by the proposer of the toast and should persist in my interpretation unruffled, while *you*, I suppose, are still affected by his protest and raise the question of whether we ought not to give up interpreting parapraxes of this kind and regard them as purely physiological acts in the pre-analytic sense. I can well imagine what it is that deters you. My interpretation carries with it the hypothesis that intentions can find expression in a speaker of which he himself knows nothing but which I am able to infer from circumstantial evidence. You are brought up short in the face of such a novel and momentous hypothesis. I can understand that, and I see your point so far as that goes. But one thing is certain. If you want to apply consistently the view of parapraxes which has been confirmed by so many examples, you will have to make up your mind to accept the strange hypothesis I have mentioned. If you cannot do that, you will have once more to abandon the understanding of parapraxes which you have only just achieved.

Let us consider for a moment what it is that unites the three groups, what it is that the three mechanisms of slips of the tongue have in common. It is fortunately unmistakable. In the first two groups the disturbing purpose is recognized by the speaker; furthermore, in the first group that purpose announces itself immediately before the slip. But in both cases *it is forced back. The speaker decides not to put it into words, and after that the slip of the tongue occurs; after that, that is to say, the purpose which has been forced back is put into words against the speaker's will, either by altering the expression of the intention which he has permitted, or by mingling with it, or by actually taking its place.* This, then, is the mechanism of a slip of the tongue.

On my view, I can bring what happens in the *third* group into complete harmony with the mechanism I have described. I have only to assume that what distinguishes these three groups from one another is the differing extent to which the intention is forced back. In the first group the intention is there and makes itself noticed before the speaker's remark; only then is it rejected; and it takes its revenge in the slip of the tongue. In the second group the rejection goes further: the intention has already ceased to be noticeable before the remark is made. Strangely enough, this does not in the least prevent it from playing its part in causing the slip. But this behaviour makes it easier for us to explain what happens in the third group. I shall venture to assume that a purpose can also find expression in a parapraxis when it has been forced back and not noticed for a considerable time, for a very long time perhaps, and can for that reason be denied straight out by the speaker. But even if you leave the problem of the third group on one side, you are bound to conclude from the observations we have made in the other cases that *the suppression of the speaker's intention to say something is the indispensable condition for the occurrence of a slip of the tongue.*

We may now claim to have made further advances in our understanding of parapraxes. We know not only that they are mental acts, in which we can detect sense and intention, not only that they come about through mutual interference between two different intentions, but beyond this we know that one of these intentions must have been in some way forced back from being put into effect before it can manifest itself as a disturbance of the other intention. It must itself have been disturbed before it can become a disturber. This does not mean, of course, that we have yet achieved a complete explanation of the phenomena which we call parapraxes. We see further questions immediately cropping up, and we suspect in general that the further our understanding goes the more occasions there will be for raising fresh questions. We may ask, for instance, why things should not be much simpler. If the intention is to force back a particular purpose instead of carrying it into effect, the forcing back should be successful, so that the purpose does not manifest itself at all; or on the other hand the forcing back might fail, so that the purpose that was to have been forced back would manifest itself completely. But parapraxes are the outcome of a compromise: they constitute a half-success and a half-failure for each of the two intentions; the intention which is being challenged is neither completely suppressed nor, apart from special cases, carried through quite unscathed. We may conclude that special conditions must prevail in order that an interference or compromise of this kind shall come about, but we can form no conception of what they can be. Nor do I think that we could discover these unknown factors by going deeper into the study of parapraxes. It will be necessary, rather, to examine first yet other obscure regions of mental life: it is only from analogies which we shall meet with there that we shall find the courage to set up the hypotheses necessary for throwing a more penetrating light upon parapraxes. And one thing more. Working from small indications, as we are constantly in the habit of doing in the present field, brings its own dangers. There is a mental disease, 'combinatory paranoia', in which the exploitation of small indications like these is carried to unlimited lengths; and I will not of course claim that conclusions built on such foundations are invariably correct. We can only be guarded against these risks by the broad basis of our observations, the repetition of similar impressions from the most varied spheres of mental life.

At this point, therefore, we will leave the analysis of parapraxes. But there is one point more to which I would draw your attention. I would ask you to bear in mind as a model the manner in which we have treated these phenomena. From this example you can learn the aims of our psychology. We seek not merely to describe and to classify phenomena, but to understand them as signs of an interplay of forces in the mind, as a manifestation of purposeful intentions working concurrently or in mutual opposition. We are concerned with a *dynamic view* of mental phenomena. On our view the phenomena that are perceived must yield in importance to trends which are only hypothetical.

We shall therefore not enter more deeply into parapraxes, but we may still undertake a cursory survey of the extent of this field, in the course of which we shall come once more upon things we already know but shall also discover some novelties. In this survey I shall keep to the division into three groups which I proposed to begin with: slips of the tongue together with their cognate forms (slips of the pen, misreading and mishearing); forgetting, subdivided according to the objects forgotten (proper names, foreign words, intentions or impressions); and bungled actions, mislaying and losing. Errors, in so far as they concern us, fall under the headings partly of forgetting and partly of bungled actions.

We have already treated *slips of the tongue* in great detail, but there are a few more points to be added. Slips of the tongue are accompanied by certain minor emotional phenomena which are not quite without interest. No one likes making slips of the tongue, and we often fail to hear our own slips, though never other people's. Slips of the tongue are also in a certain sense contagious; it is not at all easy to talk about slips of the tongue without making slips of the tongue oneself. The most trivial forms of such slips, precisely those which have no special light to throw on hidden mental processes, have reasons which are nevertheless not hard to penetrate. For instance, if someone has pronounced a long vowel short on account of a disturbance affecting the word for some reason or other, he will soon afterwards pronounce a subsequent short vowel long, thus making a fresh slip of the tongue to compensate for the earlier one. In the same way, if he pronounces a diphthong incorrectly and carelessly (for instance pronouncing an 'eu' or 'oi' as 'ei') he will try to make up for it by changing a subsequent 'ei' into an 'eu' or 'oi'. The decisive factor here seems to be consideration of the impression made on the audience, who are not to suppose that it is a matter of indifference to the speaker how he treats his mother-tongue. The second, compensating distortion actually has the purpose of directing the hearer's attention to the first one and of assuring him that the speaker has noticed it too. The commonest, simplest and most trivial slips of the tongue are contractions and anticipations which occur in insignificant parts of speech. For instance, in a longish sentence one may make a slip of the tongue which anticipates the last word of what one intends to say. This gives an impression of impatience to be finished with the sentence, and is evidence in general of a certain antipathy against communicating the sentence or against the whole of one's remarks. We thus arrive at marginal cases in which the distinctions between the psycho-analytic view of slips of the tongue and the ordinary physiological one melt into one another. It is to be assumed that a purpose of disturbing the intention of the speech is present in these cases but that it can only announce its presence and not what it itself has in view. The disturbance it produces then proceeds in accordance with certain phonetic influences or associative attractions and can be regarded as a distraction of the attention from the intention of the speech. But neither this disturbance of the attention nor the inclinations to associate which have become operative touch on the essence of the process. This remains, in spite of everything, the indication of the existence of an intention which is disturbing to the intention of the speech, though the *nature* of this disturbing intention cannot be guessed from its consequences, as is possible in all the better defined cases of slips of the tongue.

Slips of the pen, to which I now pass, are so closely akin to slips of the tongue that we have nothing new to expect from them. Perhaps we may glean one little further point. The extremely common small slips of the pen, contractions and anticipations of later words (especially of final words) point, once again, to a general dislike of writing and impatience to be done with it. More marked products of miswriting enable one to recognize the nature and aim of the disturbing purpose. If one finds a slip of the pen in a letter, one knows in general that there was something the matter with its author, but one cannot always discover what was going on in him. A slip of the pen is just as often overlooked by the person responsible as is a slip of the tongue. The following is a noteworthy observation. There are, as we know, people who are in the habit of reading through every letter they write before sending it off. Others do not do this as a rule; but if, as an exception, they do so they always come across some conspicuous slip of the pen, which they can then correct. How is this to be explained? It looks as though these people knew that they had made a mistake in writing the letter. Are we really to believe this?

An interesting problem attaches to the *practical* importance of slips of the pen. You may perhaps remember the case of a murderer, H., who found the means of obtaining cultures of highly dangerous pathogenic organisms from scientific institutes by representing himself as a bacteriologist. He then used these cultures for the purpose of getting rid of his near connections by this most modern of methods. Now on one occasion this man complained to the Directors of one of these institutes that the cultures that had been sent to him were ineffective; but he made a slip of the pen, and instead of writing 'in my experiments on mice or guinea-pigs' he wrote quite clearly 'in my experiments on men'¹. The doctors at the institute were struck by the slip, but, so far as I know, drew no conclusions from it. Well, what do you think? Should not the doctors, on the contrary, have taken the slip of the pen as a confession and started an investigation which would have put an early stop to the murderer's activities? Was not ignorance of our view of parapraxes responsible in this case for an omission of practical significance? Well, I think a slip of the pen like this would certainly have seemed to me most suspicious; but something of great importance stands in the way of using it as a confession. The matter is not as simple as all that. The slip was certainly a piece of circumstantial evidence; but it was not enough in itself to start an investigation. It is true that the slip of the pen said that he was concerned with thoughts of infecting men, but it did not make it possible to decide whether these thoughts were to be taken as a clear intention to injure or as a phantasy of no practical importance. It is even possible that a man who had made a slip like this would have every subjective justification for denying the phantasy and would repudiate it as something entirely foreign to him. You will understand these possibilities still better when later on we come to consider the distinction between psychical and material reality. But this is another instance of a parapraxis acquiring importance from subsequent events.

¹ ['*Menschen*' instead of '*Mäusen oder Meerschweinchen*'.]

With *misreading* we come to a psychical situation which differs sensibly from that in slips of the tongue or pen. Here one of the two mutually competing purposes is replaced by a sensory stimulation and is perhaps on that account less resistant. What one is going to read is not a derivative of one's own mental life like something one proposes to write. In a great majority of cases, therefore, a misreading consists in a complete substitution. One replaces the word that is to be read by another, without there necessarily being any connection of content between the text and the product of the misreading, which depends as a rule on verbal similarity. The best member of this group is Lichtenberg's '*Agamemnon*' for '*angenommen*'. If we want to discover the disturbing purpose which produced the misreading we must leave the text that has been misread entirely aside and we may begin the analytic investigation with the two questions: what is the first association to the product of the misreading? and in what situation did the misreading occur? Occasionally a knowledge of the latter is alone enough to explain the misreading. For instance, a man under the pressure of an imperious need was wandering about in a strange town when he saw the word '*Closet-House*' on a large notice board on the first storey of a building. He had just enough time to feel surprised at the notice-board being placed so high up before discovering that, strictly speaking, what he should have read was '*Corset-House*'. In other cases a misreading precisely of the kind which is quite independent of the content of the text may call for a detailed analysis which cannot be carried through without practice in the technique of psycho-analysis and without reliance on it. As a rule, however, it is not so hard to find the explanation of a misreading: the word substituted immediately betrays, as in the Agamemnon example, the circle of ideas from which the disturbance has arisen. In this time of war, for instance, it is a very usual thing for the names of towns and generals and the military terms that are constantly buzzing around us to be read wherever a similar word meets our eyes. Whatever interests and concerns us puts itself in the place of what is strange and still uninteresting. After-images of thoughts trouble new perceptions.

With misreading, too, there is no lack of cases of another sort, in which the text of what is read itself arouses the disturbing purpose, which thereupon, as a rule, turns it into its opposite. What we ought to read is something unwished-for, and analysis will convince us that an intense wish to reject what we have read must be held responsible for its alteration.

In the more frequent cases of misreading which we mentioned first, we miss two factors to which we have assigned an important role in the mechanism of parapraxes: a conflict between two purposes and a forcing-back of one of them which takes its revenge by producing a parapraxis. Not that anything contrary to this occurs in misreading. But the prominence of the thought that leads to the misreading is far more noticeable than the forcing-back which it may have experienced previously.

It is these two factors which we meet with most markedly in the different situations in which parapraxes of forgetting occur. *The forgetting of intentions* is quite unambiguous; as we have already seen, its interpretation is not disputed even by laymen. The purpose which disturbs the intention is in every instance a counter-intention, an unwillingness; and all that remains for us to learn about it is why it has not expressed itself in some other and less disguised manner. But the presence of this counter-will is unquestionable. Sometimes, too, we succeed in guessing something of the motives which compel this counter-will to conceal itself; acting surreptitiously by means of the parapraxis it always achieves its aim, whereas it would be sure of repudiation if it emerged as an open contradiction. If some important change in the psychical situation takes place between the forming of the intention and its carrying-out, as a result of which there is no longer any question of the intention being carried out, then the forgetting of the intention drops out of the category of parapraxes. It no longer seems strange to have forgotten it, and we realize that it would have been unnecessary to remember it: thereafter it becomes permanently or temporarily extinct. The forgetting of an intention can only be called a parapraxis if we cannot believe that the intention has been interrupted in this latter way.

The instances of forgetting an intention are in general so uniform and so perspicuous that for that very reason they are of no interest for our investigation. Nevertheless there are two points at which we can learn something new from a study of these parapraxes. Forgetting - that is, failure to carry out an intention - points, as we have said, to a counter-will that is hostile to it. This is no doubt true; but our enquiries show that the counter-will can be of two kinds - direct or indirect. What I mean by the latter will best appear from one or two examples. If a patron forgets to put in a word with a third person on behalf of his *protégé* this may happen because he is not really very much interested in the *protégé* and therefore has no great desire to speak on his behalf. In any case, that is how the *protégé* will understand the patron's forgetting. But things may be more complicated. The counter-will in the patron against carrying out the intention may come from another direction and may be aimed at quite a different point. It may have nothing to do with the *protégé* but may perhaps be directed against the third person to whom the recommendation was to have been made. So you see from this once more the doubts that stand in the way of a practical application of our interpretations. In spite of the correct interpretation of the forgetting, the *protégé* is in danger of being too distrustful and of doing his patron a grave injustice. Or, supposing someone forgets an appointment which he has promised someone else to keep, the most frequent reason for it will be, no doubt, a direct disinclination to meeting this person. But in such a case analysis might show that the disturbing purpose did not relate to him but was directed against the place at which the meeting was planned to happen and was avoided on account of a distressing memory attaching to it. Or, again, if someone forgets to post a letter, the counter-purpose may be based on the contents of the letter; but it is by no means out of the question that the letter may be harmless in itself and may only be subject to the counter-purpose because something about it recalls another letter which had been written on some earlier occasion and which offered the counter-will a direct point of attack. It can be said, therefore, that here the counter-will was transferred from the earlier letter, which justified it, to the present one, which it had in fact no grounds for concern about. You see, then, that we must practise restraint and foresight in applying our interpretations, justified as they are: things that are psychologically equivalent may in practice have a great variety of meanings.

Phenomena such as these last may seem to you most unusual, and you will perhaps be inclined to suppose that an 'indirect' counter-will already indicates that the process is a pathological one. But I can assure you that it occurs as well within the limits of what is normal and healthy. Moreover you should not misunderstand me. I am far from admitting that our analytic interpretations are untrustworthy. The ambiguities in the forgetting of intentions which I have been mentioning exist only so long as we have not made an analysis of the case and are only making our interpretations on the basis of our general assumptions. If we carry out an analysis upon the person in question, we invariably learn with sufficient certainty whether the counter-will is a direct one or what other origin it may have.

The second point I have in mind is this. If in a large majority of instances we find confirmation of the fact that the forgetting of an intention goes back to a counter-will, we grow bold enough to extend the solution to another set of instances in which the person under analysis does not confirm but denies the counter-will we have inferred. Take as examples of this such extremely common events as forgetting to return books one has been lent or to pay bills or debts. We shall venture to insist to the person concerned that an intention exists in him to keep the books and not to pay the debts, while he will deny this intention but will not be able to produce any other explanation of his behaviour. Thereupon we shall go on to say that he has this intention but knows nothing about it, but that it is enough for us that it reveals its presence by producing the forgetting in him. He may repeat to us that he has in fact forgotten. You will now recognize the situation as one in which we found ourselves once before. If we want to pursue our interpretations of parapraxes, which have so frequently proved justified, to a consistent conclusion, we are forced to the inescapable hypothesis that there are purposes in people which can become operative without their knowing about them. But this brings us into opposition to all the views that dominate both ordinary life and psychology.

The forgetting of proper names and foreign names, as well as of foreign words, can similarly be traced back to a counter-intention, which is aimed either directly or indirectly against the name concerned. I have already given you several instances of direct dislike. But indirect causation is particularly frequent in these cases and can usually only be established by careful analyses. For instance, during the present war, which has obliged us to give up so many of our former enjoyments, our power of remembering proper names has suffered greatly as the result of the strangest associations. A short time ago I found that I was unable to reproduce the name of the innocent Moravian town of *Bisenz*; and analysis showed that what was responsible for this was not any direct hostility to it but its resemblance in sound to the name of the Palazzo *Bisenzi* in Orvieto which I had repeatedly enjoyed visiting in the past. Here for the first time, in this reason for objecting to remembering a name, we come across a principle which will later on reveal its enormous importance for the causation of neurotic symptoms: the memory's disinclination to remembering anything which is connected with feelings of unpleasure and the reproduction of which would renew the unpleasure. This intention to avoid unpleasure arising from a recollection or from other psychical acts, this psychical flight from unpleasure, may be recognized as the ultimate operative motive not only for the forgetting of names but for many other parapraxes, such as omissions, errors, and so on.

The forgetting of names, however, seems particularly facilitated psycho-physiologically, and for that reason cases occur in which interference by the unpleasure motive cannot be confirmed. If someone has a tendency to forget names, analytic investigation will show that names escape him not only because he does not like them themselves or because they remind him of something disagreeable, but also because in his case the same name belongs to another circle of associations with which he is more intimately related. The name is, as it were, anchored there and is kept from contact with the other associations which have been momentarily activated. If you recall the tricks of mnemotechnics, you will realize with some surprise that the same chains of association which are deliberately laid down in order to *prevent* names from being forgotten can also *lead* to our forgetting them. The most striking example of this is afforded by the proper names of persons, which naturally possess quite different psychical importance for different people. Let us, for instance, take a first name such as Theodore. To one of you it will have no special meaning, to another it will be the name of his father or brother or of a friend, or his own name. Analytic experience will then show you that the first of these people is in no danger of forgetting that a particular stranger bears this name, whereas the others will be constantly inclined to withhold from strangers a name which seems to them reserved for intimate connections. If you now bear in mind that this associative inhibition may coincide with the operation of the unpleasure principle and, besides that, with an indirect mechanism, you will be in a position to form an adequate idea of the complications in the causation of the temporary forgetting of a name. An appropriate analysis will however unravel every one of these tangles for you.

The forgetting of impressions and experiences demonstrates much more clearly and exclusively than the forgetting of names the operation of the purpose of keeping disagreeable things out of memory. The whole field of this kind of forgetting does not, of course, fall within the class of parapraxes, but only such cases as, measured by the standard of our usual experience, seem to us striking and unjustified: for instance, when the forgetting affects impressions that are too fresh or important, or when the missing memory tears a gap in what is otherwise a well remembered chain of events. Why and in what way we are able to forget in general, and among other things experiences which have certainly left the deepest impression upon us, such as the events of our earliest childhood years, - that is quite another problem, in which fending off unpleasurable impulses plays a certain part but is far from being the whole explanation. It is an undoubted fact that disagreeable impressions are easily forgotten. Various psychologists have noticed it and the great Darwin was so much impressed by it that he made it 'a golden rule' to note down with especial care any observations which seemed unfavourable to his theory, since he had convinced himself that precisely they would not remain in his memory.

A person who hears for the first time of this principle of the fending off of unpleasurable memories by forgetting rarely fails to object that on the contrary it has been his experience that distressing things are particularly hard to forget but keep on returning to torment him against his will - memories, for instance, of insults and humiliations. This is also a true fact, but the objection is not to the point. It is important to begin in good time to reckon with the fact that mental life is the arena and battle-ground for mutually opposing purposes or, to put it non-dynamically, that it consists of contradictions and pairs of contraries. Proof of the existence of a particular purpose is no argument against the existence of an opposite one; there is room for both. It is only a question of the attitude of these contraries to each other, and of what effects are produced by the one and by the other.

Losing and mislaying are of particular interest to us owing to the many meanings they may have - owing, that is, to the multiplicity of the purposes which can be served by these parapraxes. All cases have in common the fact that there was a wish to lose something; they differ in the basis and aim of that wish. We lose a thing when it is worn out, when we intend to replace it by a better one, when we no longer like it, when it originates from someone with whom we are no longer on good terms or when we acquired it in circumstances we no longer want to recall. Dropping, damaging or breaking the object can serve the same purpose. In the sphere of social life experience is said to have shown that unwanted and illegitimate children are far more frail than those legitimately conceived. The crude technique of baby-farmers is not necessary for bringing about this result; a certain amount of neglect in looking after the children should be quite sufficient. The preserving of *things* may be subject to the same influences as that of children.

Things may, however, be condemned to be lost without their value having suffered any diminution - when, that is, there is an intention to sacrifice something to Fate in order to ward off some other dreaded loss. Analysis tells us that it is still quite a common thing among us to exorcize Fate in this way; and thus our losing is often a voluntary sacrifice. In the same way, losing may also serve the purpose of defiance or self-punishment. In short, the more remote reasons for the intention to get rid of a thing by losing it are beyond number.

Bungled actions, like other errors, are often used to fulfil wishes which one ought to deny oneself. Here the intention disguises itself as a lucky accident. For instance, as happened to one of my friends, a man may be due, obviously against his will, to go by train to visit someone near the town where he lives, and then, at a junction where he has to change, may by mistake get into a train that takes him back to where he came from. Or someone on a journey may be anxious to make a stop at an intermediate station but may be forbidden from doing so by other obligations, and he may then overlook or miss some connection so that he is after all obliged to break his journey in the way he wished. Or what happened to one of my patients: I had forbidden him to telephone to the girl he was in love with, and then, when he meant to telephone to me, he asked for the wrong number 'by mistake' or 'while he was thinking of something else' and suddenly found himself connected to the girl's number. A good example of an outright blunder, and one of practical importance, is provided by an observation made by an engineer in his account of what preceded a case of material damage:

'Some time ago I worked with several students in the laboratory of the technical college on a series of complicated experiments in elasticity, a piece of work which we had undertaken voluntarily but which was beginning to take up more time than we had expected. One day as I returned to the laboratory with my friend F., he remarked how annoying it was to him to lose so much time on that particular day as he had so much else to do at home. I could not help agreeing with him and added half jokingly, referring to an incident the week before: "Let us hope that the machine will go wrong again so that we can stop work and go home early."

'In arranging the work it happened that F. was given the regulation of the valve of the press; that is to say, he was, by cautiously opening the valve, to let the fluid under pressure flow slowly out of the accumulator into the cylinder of the hydraulic press. The man conducting the experiment stood by the manometer and when the right pressure was reached called out a loud "Stop!" At the word of command F. seized the valve and turned it with all his might - to the left! (All valves without exception are closed by being turned to the right.) This caused the full pressure of the accumulator to come suddenly on to the press, a strain for which the connecting-pipes are not designed, so that one of them immediately burst - quite a harmless accident to the machine, but enough to oblige us to suspend work for the day and go home.

'It is characteristic, by the way, that when we were discussing the affair some time later my friend F. had no recollection whatever of my remark, which I recalled with certainty.'

This may lead you to suspect that it is not always just an innocent chance that turns the hands of your domestic servants into dangerous enemies of your household belongings. And you may also raise the question whether it is always a matter of chance when people injure themselves and risk their own safety. These are notions whose value you may care to test, if occasion arises, by analysing observations of your own.

This, Ladies and Gentlemen, is far from being all that might be said about parapraxes. Much remains that might be examined and discussed. But I am satisfied if our discussion of the subject so far has to some extent shaken your previous views and has made you a little prepared to accept new ones. I am content, for the rest, to leave you faced with an unclarified situation. We cannot establish all our doctrines from a study of parapraxes and we are not obliged to draw our evidence from that material alone. The great value of parapraxes for our purposes lies in their being very common phenomena which, moreover, can easily be observed in oneself, and which can occur without the slightest implication of illness. There is only one of your unanswered questions which I should like to put into words before I end. If, as we have found from many instances, people come so close to an understanding of parapraxes and so often behave as though they grasped their sense, how is it possible that they none the less set down these same phenomena as being in general chance events without sense or meaning, and that they can oppose the psycho-analytic elucidation of them with so much vigour?

You are right. This is a remarkable fact and it calls for an explanation. But I will not give you one. Instead, I will introduce you by degrees to fields of knowledge from which the explanation will force itself upon you without any contribution of mine.

Introductory Lectures On Psycho-Analysis

PART II

DREAMS

(1916)

LECTURE V

DIFFICULTIES AND FIRST APPROACHES

LADIES AND GENTLEMEN, - It was discovered one day that the pathological symptoms of certain neurotic patients have a sense.¹ On this discovery the psycho-analytic method of treatment was founded. It happened in the course of this treatment that patients, instead of bringing forward their symptoms, brought forward dreams. A suspicion thus arose that the dreams too had a sense.

We will not, however, follow this historical path, but will proceed in the opposite direction. We will demonstrate the sense of dreams by way of preparing for the study of the neuroses. This reversal is justified, since the study of dreams is not only the best preparation for the study of the neuroses, but dreams are themselves a neurotic symptom, which, moreover, offers us the priceless advantage of occurring in all healthy people. Indeed, supposing all human beings were healthy, so long as they dreamt we could arrive from their dreams at almost all the discoveries which the investigation of the neuroses has led to.

¹ By Josef Breuer in the years 1880-2. Cf. the lectures delivered by me in America in 1909 (*Five Lectures on Psycho-Analysis*) and 'On the History of the Psycho-Analytic Movement'.

Dreams, then, have become a subject of psycho-analytic research: once again ordinary phenomena, with little value set on them, and apparently of no practical use - like parapraxes, with which indeed they have in common the fact of occurring in healthy people. But apart from this the conditions for our work are a good deal less favourable here. Parapraxes had merely been neglected by science, little attention had been paid to them; but at least there was no harm in concerning oneself with them. 'No doubt', people would say, 'there are more important things. But something may possibly come of it.' But to concern oneself with dreams is not merely unpractical and uncalled-for, it is positively disgraceful. It brings with it the odium of being unscientific and rouses the suspicion of a personal inclination to mysticism. Imagine a medical man going in for dreams when there are so many more serious things even in neuropathology and psychiatry - tumours as big as apples compressing the organ of the mind, haemorrhages, chronic inflammation, in all of which the changes in the tissues can be demonstrated under the microscope! No, dreams are much too trivial, and unworthy to be an object of research.

And there is something else which from its very nature frustrates the requirements of exact research. In investigating dreams one is not even certain about the object of one's research. A delusion, for instance, meets one squarely and with definite outlines. 'I am the Emperor of China', says the patient straight out. But dreams? As a rule no account at all can be given of them. If anyone gives an account of a dream, has he any guarantee that his account has been correct, or that he may not, on the contrary, have altered his account in the course of giving it and have been obliged to invent some addition to it to make up for the indistinctness of his recollection? Most dreams cannot be remembered at all and are forgotten except for small fragments. And is the interpretation of material of this kind to serve as the basis of a scientific psychology or as a method for treating patients?

An excess of criticism may make us suspicious. These objections to dreams as an object of research are obviously carried too far. We have already dealt with the question of unimportance in connection with parapraxes. We have told ourselves that big things can show themselves by small indications. As regards their indistinctness - that is one of the characteristics of dreams, like any other: we cannot lay down for things what their characteristics are to be. And incidentally there are clear and distinct dreams as well. There are, more over, other objects of psychiatric research which suffer from the same characteristic of indistinctness - in many instances, for example, obsessions, and these have been dealt with, after all, by respected and esteemed psychiatrists. I recall the last such case that I came across in my medical practice. This was a woman patient who introduced herself with these words: 'I have a sort of feeling as though I had injured or had wanted to injure some living creature - a child? - no, more like a dog - as though I may have thrown it off a bridge, or something else.' We can help to overcome the defect of the uncertainty in remembering dreams if we decide that whatever the dreamer tells us must count as his dream, without regard to what he may have forgotten or have altered in recalling it. And finally it cannot even be maintained so sweepingly that dreams are unimportant things. We know from our own experience that the mood in which one wakes up from a dream may last for the whole day; doctors have observed cases in which a mental disease has started with a dream and in which a delusion originating in the dream has persisted; historical figures are reported to have embarked on momentous enterprises in response to dreams. We may therefore ask what may be the true source of the contempt in which dreams are held in scientific circles.

It is, I believe, a reaction against the overvaluation of dreams in earlier days. The reconstruction of the past is, as we know, no easy matter, but we may assume with certainty, if I may put it as a joke, that our ancestors three thousand or more years ago already had dreams like ours. So far as we know, all the peoples of antiquity attached great significance to dreams and thought they could be used for practical purposes. They deduced signs for the future from them and searched in them for auguries. For the Greeks and other oriental nations, there may have been times when a campaign without dream-interpreters seemed as impossible as one without air-reconnaissance seems to-day. When Alexander the Great started on his conquests, his train included the most famous dream-interpreters. The city of Tyre, which at that time still stood on an island, offered the king such a stiff resistance that he considered the possibility of raising the siege. Then one night he had a dream of a satyr who seemed to be dancing in triumph, and when he reported it to his dream-interpreters they informed him that it foretold his conquest of the city. He ordered an assault and captured Tyre. Among the Etruscans and Romans other methods of foretelling the future were in use; but throughout the whole of the Hellenistic-Roman period the interpretation of dreams was practised and highly esteemed. Of the literature dealing with the subject the principal work at least has survived: the book by Artemidorus of Daldis, who probably lived during the reign of the Emperor Hadrian. How it came about after this that the art of interpreting dreams declined and that dreams fell into discredit I cannot tell you. The spread of enlightenment cannot have had much to do with it, for many things more absurd than the dream-interpretation of antiquity were faithfully preserved in the obscurity of the Middle Ages. The fact remains that interest in dreams gradually sank to the level of superstition and could survive only among the uneducated classes. The final abuse of dream-interpretation was reached in our days with attempts to discover from dreams the numbers fated to be drawn in the game of lotto. On the other hand the exact science of to-day has repeatedly concerned itself with dreams but always with the sole aim of applying its physiological theories to them. Medical men, of course, looked on dreams as non-psychical acts, as the expression in mental life of somatic stimuli. Binz (1878) pronounced that dreams are 'somatic processes, which are in every case useless and in many cases positively pathological, to which the soul of the universe and immortality are as sublimely superior as the blue sky above some weed-grown, low-lying stretch of sand.' Maury compares dreams to the disordered twitchings of St. Vitus's dance as contrasted with the co-ordinated movements of a healthy man. According to an old analogy, the contents of a dream are like the sounds produced when 'the ten fingers of a man who knows nothing of music wander over the keys of a piano'.

Interpreting means finding a hidden sense in something; there can of course be no question of doing that if we adopt this last estimate of the function of dreams. Look at the description of dreams given by Wundt, Jodl, and other more recent philosophers. They content themselves with enumerating the respects in which dream-life differs from waking thought, always in a sense depreciatory to dreams - emphasizing the fact that associations are broken apart, that the critical faculty ceases to work, that all knowledge is eliminated, as well as other signs of diminished functioning. The only valuable contribution to the knowledge of dreams for which we have to thank exact science relates to the effect produced on the content of dreams by the impact of somatic stimuli during sleep. A recently deceased Norwegian author, J. Mourly Vold, published two stout volumes of experimental researches into dreams (German edition, 1910 and 1912), which are devoted almost exclusively to the consequences of alterations in the posture of the limbs. They have been recommended to us as models of exact research into dreams. Can you imagine what exact science would say if it learnt that we want to make an attempt to discover the *sense* of dreams? Perhaps it has already said it. But we will not let ourselves be frightened off. If it was possible for *parapraxes* to have a sense, dreams can have one too; and in a great many cases *parapraxes* *have* a sense, which has escaped exact science. So let us embrace the prejudice of the ancients and of the people and let us follow in the footsteps of the dream-interpreters of antiquity.

We must begin by finding our bearings in the task before us and taking a general survey of the field of dreams. What, then, is a dream? It is hard to answer in a single sentence. But we will not attempt a definition when it is enough to point to something familiar to everyone. We should, however, bring the essential feature of dreams into prominence. Where is that to be found, though? There are such immense differences within the frame that comprises our subject - differences in every direction. The essential feature will presumably be something that we can point to as common to all dreams.

The first thing common to all dreams would seem to be, of course, that we are asleep during them. Dreaming is evidently mental life during sleep - something which has certain resemblances to waking mental life but which, on the other hand, is distinguished from it by large differences. This was, long ago, Aristotle's definition. It may be that there are still closer connections between dreams and sleep. We can be woken by a dream; we very often have a dream when we wake up spontaneously or if we are forcibly aroused from sleep. Thus dreams seem to be an intermediate state between sleeping and waking. So our attention is turned to sleep. Well, then, what is sleep?

That is a physiological or biological problem about which much is still in dispute. On that we can come to no conclusion; but we ought, I think, to try to describe the psychological characteristics of sleep. Sleep is a state in which I want to know nothing of the external world, in which I have taken my interest away from it. I put myself to sleep by withdrawing from the external world and keeping its stimuli away from me. I also go to sleep when I am fatigued by it. So when I go to sleep I say to the external world: 'Leave me in peace: I want to go to sleep.' On the contrary, children say: 'I'm not going to sleep yet; I'm not tired, and I want to have some more experiences.' The biological purpose of sleep seems therefore to be rehabilitation, and its psychological characteristic suspense of interest in the world. Our relation to the world, into which we have come so unwillingly, seems to involve our not being able to tolerate it uninterruptedly. Thus from time to time we withdraw into the premundane state, into existence in the womb. At any rate, we arrange conditions for ourselves very like what they were then: warm, dark and free from stimuli. Some of us roll ourselves up into a tight package and, so as to sleep, take up a posture much as it was in the womb. The world, it seems, does not possess even those of us who are adults completely, but only up to two thirds; one third of us is still quite unborn. Every time we wake in the morning it is like a new birth. Indeed, in speaking of our state after sleep, we say that we feel as though we were newly born. (In saying this, incidentally, we are making what is probably a very false assumption about the general sensations of a new-born child, who seems likely, on the contrary, to be feeling very uncomfortable.) We speak, too, of being born as 'first seeing the light of day'.

If this is what sleep is, dreams cannot possibly form part of its programme, but seem on the contrary to be an unwelcome addition to it. In our opinion too, a dreamless sleep is the best, the only proper one. There ought to be no mental activity in sleep; if it begins to stir, we have not succeeded in establishing the foetal state of rest: we have not been able entirely to avoid residues of mental activity. Dreaming would consist in these residues. But if so, it would really seem that there is no need for dreams to have any sense. It was different with parapraxes; they, after all, were activities during waking life. But if I am asleep and have stopped mental activity completely and have merely failed to suppress some residues of it, then there is no need whatever for these residues to have any sense. I cannot even make use of any such sense, since the rest of my mental life is asleep. So it really can only be a matter of reactions, in the nature of 'twitchings', of mental phenomena such as result directly from a somatic stimulus. Dreams would accordingly be residues of waking mental activity which were disturbing sleep, and we might well decide to drop the subject at once, as not being suited to psycho-analysis.

Even if dreams are superfluous, however, they do exist, and we can try to account for their existence. Why does mental life fail to go to sleep? Probably because there is something that will not allow the mind any peace. Stimuli impinge upon it and it must react to them. A dream, then, is the manner in which the mind reacts to stimuli that impinge upon it in the state of sleep. And here we see a way of access to an understanding of dreams. We can take various dreams and try to discover what the stimulus was which was seeking to disturb sleep and to which the reaction was a dream. Our examination of the first thing common to all dreams seems to have taken us so far.

Is there anything else common to them? Yes, something unmistakable but much harder to grasp and to describe. Mental processes in sleep have a quite different character from those of waking life. We experience every sort of thing in dreams and believe in it, whereas nevertheless we experience nothing, except, perhaps, the single disturbing stimulus. We experience it predominantly in visual images; feelings may be present too, and thoughts interwoven in it as well; the other senses may also experience something, but nonetheless it is predominantly a question of images. Part of the difficulty of giving an account of dreams is due to our having to translate these images into words. 'I could draw it', a dreamer often says to us, 'but I don't know how to say it.' This is not, however, a *reduced* mental activity, like that of a feeble-minded person as compared to that of a genius: it is *qualitatively* different, though it is hard to say where the difference lies. G. T. Fechner once voiced a suspicion that the scene of action of dreams (in the mind) is different from that of waking ideational life. Though we do not understand this and do not know what we are to make of it, it does in fact reproduce the impression of strangeness which most dreams make on us. The comparison between dream-activity and the effects of an unmusical hand on the piano does not help us here. The piano will after all respond with the same sounds, though not with tunes, to any chance pressure on its keys. Let us carefully bear this second thing common to all dreams in mind, even though we may not have understood it.

Are there any other things common to them? I cannot discover any; I can see nothing anywhere but differences, and differences in all kinds of ways: in their apparent duration, as well as in their clarity, in the amount of affect accompanying them, in the possibility of retaining them, and so on. This variety is not in fact what we might expect to find in a mere defensive reaction to a stimulus, something mechanically imposed, an empty thing, like the twittings of St. Vitus's dance. As regards the dimensions of dreams, some are very short and comprise only a single image or a few, a single thought, or even a single word; others are uncommonly rich in their content, present whole novels and seem to last a long time. There are dreams which are as clear as experience, so clear that quite a time after waking we do not realize that they were dreams; and there are others which are indescribably dim, shadowy and blurred. Indeed in one and the same dream excessively definite portions may alternate with others of scarcely discernible vagueness. Dreams may be entirely sensible or at least coherent, witty even, or fantastically beautiful; others, again, are confused, feeble-minded as it were, absurd, often positively crazy. There are dreams that leave us quite cold and others in which affects of all kinds are manifest - pain to the point of tears, anxiety to the point of waking us up, astonishment, delight, and so on. Dreams are usually quickly forgotten after waking, or they may last through the day, remembered more and more dimly and incompletely till evening; others, again - for instance, childhood dreams - are so well preserved that after thirty years they remain in the memory like some fresh experience. Dreams may appear, like individuals, on a single occasion only and never again, or they may recur in the same person unchanged or with small divergences. In short, this fragment of mental activity during the night has an immense repertory at its disposal; it is capable, in fact, of all that the mind creates in daytime - yet it is never the same thing.

We might try to account for these many variations in dreams by supposing that they correspond to different intermediate stages between sleeping and waking, different degrees of in complete sleep. Yes, but if this were so, the value, content and clarity of a dream's product - and the awareness, too, of its being a dream - would have to increase in dreams in which the mind was coming near to waking; and it would not be possible for a clear and rational fragment of dream to be immediately followed by one that was senseless and obscure and for this in turn to be followed by another good piece. The mind could certainly not alter the depth of its sleep so quickly as that. So this explanation is of no help: there can be no short cut out of the difficulty.

We will for the moment leave on one side the 'sense' of dreams, and try to make our way to a better understanding of them from what we have found is common to them. We inferred from the relation of dreams to the state of sleep that dreams are the reaction to a stimulus which disturbs sleep. We have learnt that this too is the single point on which exact experimental psychology is able to come to our assistance: it brings us evidence that stimuli which impinge during sleep make their appearance in dreams. Many investigations of this kind have been made, most recently those by Mourly Vold which I have already mentioned; and each of us, no doubt, has been in a position to confirm this finding from personal observation. I will select a few of the earlier experiments. Maury had some experiments performed on himself. He was given some eau-de-cologne to smell in his sleep. He dreamt he was in Cairo, in Johann Maria Farina's shop, and some further absurd adventures followed. Or, he was pinched lightly on the neck; he dreamt of a mustard plaster being applied to him and of a doctor who had treated him as a child. Or again, a drop of water was dropped on his forehead; he was in Italy, was sweating violently and was drinking white Orvieto wine.

The striking thing about these experimentally produced dreams will perhaps be even more plainly visible in another series of stimulus-dreams. They are three dreams reported by an intelligent observer, Hildebrandt, all of them reactions to the ringing of an alarm-clock:

'I dreamt, then, that one spring morning I was going for a walk and was strolling through the green fields till I came to a neighbouring village, where I saw the villagers in their best clothes, with hymn-books under their arms, flocking to the church. Of course! It was Sunday, and early morning service would soon be beginning. I decided I would attend it; but first, as I was rather hot from walking, I went into the church yard which surrounded the church, to cool down. While I was reading some of the tombstones, I heard the bell-ringer climbing up the church tower and at the top of it I now saw the little village bell which would presently give the signal for the beginning of devotions. For quite a while it hung there motionless, then it began to swing, and suddenly its peal began to ring out clear and piercing - so clear and piercing that it put an end to my sleep. But what was ringing was the alarm-clock.

'Here is another instance. It was a bright winter's day and the streets were covered with deep snow. I had agreed to join a party for a sleigh-ride; but I had to wait a long time before news came that the sleigh was at the door. Now followed the preparations for getting in - the fur rug spread out, the foot muff put ready - and at last I was sitting in my seat. But even then the moment of departure was delayed till a pull at the reins gave the waiting horses the signal. Then off they started, and, with a violent shake, the sleigh bells broke into their familiar jingle - with such violence, in fact, that in a moment the cobweb of my dream was torn through. And once again it was only the shrill sound of the alarm-clock.

'And now yet a third example. I saw a kitchenmaid, carrying several dozen plates piled on one another, walking along the passage to the dining-room. The column of china in her arms seemed to me in danger of losing its balance. "Take care," I exclaimed, "or you'll drop the whole load." The inevitable rejoinder duly followed: she was quite accustomed to that kind of job, and so on. And meanwhile my anxious looks followed the advancing figure. Then - just as I expected - she stumbled at the threshold and the fragile crockery slipped and rattled and clattered in a hundred pieces on the floor. But the noise continued without ceasing, and soon it seemed no longer to be a clattering; it was turning into a ringing - and the ringing, as my waking self now became aware, was only the alarm-clock doing its duty.'

These are very nice dreams, entirely sensible and by no means as incoherent as dreams are usually apt to be. I am not objecting to them on that account. What they have in common is that in each case the situation ends in a noise, which, when the dreamer wakes up, is recognized as being made by the alarm-clock. So we see here how a dream is produced; but we learn something more than this. The dream does not recognize the alarm-clock - nor does it appear in the dream - but it replaces the noise of the alarm-clock by another; it interprets the stimulus which is bringing sleep to an end, but it interprets it differently each time. Why does it do that? There is no answer to this; it seems a matter of caprice. Understanding the dream would mean being able to say why this particular noise and none other was chosen for the interpretation of the stimulus from the alarm-clock. We may make an analogous objection to Maury's experiments: we can see quite clearly that the impinging stimulus appears in the dream; but why it should take this particular form we are not told, and it does not seem by any means to follow from the nature of the stimulus that disturbed sleep. In Maury's experiments, too, a quantity of other dream material usually appears in addition to the direct effect of the stimulus - for instance, the 'absurd adventures' in the eau-de-cologne dream -, which cannot be accounted for.

And now consider that *arousal* dreams offer the best chance of establishing the influence of external sleep-disturbing stimuli. In most other cases it will become more difficult. We do not wake out of every dream, and if we remember a dream of the past night in the morning, how are we to discover a disturbing stimulus which may perhaps have made its impact on us during the night? I once succeeded in identifying a sound-stimulus of that kind retrospectively, but only, of course, owing to special circumstances. I woke up one morning in a mountain resort in the Tyrol, knowing I had had a dream that the Pope was dead. I could not explain the dream to myself; but later on my wife asked me if I had heard the fearful noise made by the pealing of bells towards morning which had broken out from all the churches and chapels. No, I had heard nothing, my sleep is more resistant than hers; but thanks to her information I understood my dream. How often may stimuli of this kind instigate dreams in a sleeper without his getting news of them afterwards? Perhaps very often, but perhaps not. If the stimulus can no longer be pointed to, we cannot be convinced of its existence. And in any case we have changed our view of the importance of external stimuli that disturb sleep since we learnt that they can explain only a small portion of the dream and not the whole dream-reaction.

There is no need to give up this theory entirely on that account. Moreover it is capable of extension. It is obviously a matter of indifference what it is that disturbs sleep or instigates the mind to dream. If it cannot invariably be a sensory stimulus coming from outside, there may instead be what is called a somatic stimulus, arising from the internal organs. This is a very plausible notion and agrees with the most popular view of the origin of dreams: 'dreams come from indigestion', people often say. Here too unluckily we must often suspect that there are cases when a somatic stimulus which has impinged on a sleeper during the night is no longer manifest after waking and can therefore not be proved to have occurred. But we shall not overlook the number of clear experiences which support the origin of dreams from somatic stimuli. In general, there can be no doubt that the condition of the internal organs can influence dreams. The relation of the content of some dreams to an over full bladder or to a state of excitation of the genital organs is too plain to be mistaken. These clear cases lead to others in which the content of the dreams give rise to a justifiable suspicion that there has been an impact from somatic stimuli because there is something in the content which can be regarded as a working over, a representation or an interpretation of such stimuli. Scherner (1861), who made researches into dreams, argued particularly strongly in favour of the derivation of dreams from organic stimuli and brought forward some good examples of it. For instance, in one dream he saw 'two rows of pretty boys with fair hair and delicate complexions facing one another in pugnacious array, making an onset and attacking one another, and then drawing back and taking up their old position again, and then starting the whole business once more.' His interpretation of these two rows of boys as teeth is plausible in itself and seems fully confirmed when we learn that after this scene the dreamer 'pulled a long tooth out of his jaw.' Similarly, the interpretation of 'long, narrow, winding passages' as derived from an intestinal stimulus seems valid, and confirms the assertion by Scherner that dreams seek above all to represent the organ that sends out the stimulus by objects resembling it.

Thus we must be prepared to admit that internal stimuli can play the same part in dreams as external ones. Any estimate of their importance is unfortunately open to the same objections. In a large number of cases an interpretation pointing to a somatic stimulus is uncertain or unprovable. Not all dreams, but only a certain number of them give rise to a suspicion that internal organic stimuli had a share in their origin. And lastly, internal somatic stimuli are as little able as external sensory stimuli to explain more of a dream than what corresponds in it to a direct reaction to the stimulus. Where the rest of the dream comes from remains obscure.

Let us notice, however, one peculiarity of dream-life which comes to light in this study of the effects of stimuli. Dreams do not simply reproduce the stimulus; they work it over, they make allusions to it, they include it in some context, they replace it by something else. This is a side of the dream-work which is bound to interest us since it may perhaps bring us nearer to the essence of dreams. When a person constructs something as a result of a stimulus, the stimulus need not on that account exhaust the whole of the work. Shakespeare's *Macbeth*, for instance, was a *pièce d'occasion* composed to celebrate the accession of the king who first united the crowns of the three kingdoms. But does this immediate historical occasion cover the content of the tragedy? Does it explain its greatnesses and its enigmas? It may be that the external and internal stimuli, too, impinging on the sleeper, are only the *instigators* of the dream and will accordingly betray nothing to us of its essence.

The second thing that is common to dreams, their psychical peculiarity, is on the one hand hard to grasp and on the other offers us no starting-point for further enquiry. We experience things in dreams as a rule in visual forms. Can the stimuli throw any light on this? Is what we experience in fact the stimulus? But, if so, why is the experience visual, while it is only in the rarest cases that optical stimulation has instigated the dream? Or if we dream spoken words, can it be shown that during sleep a conversation, or some noise resembling one made its way into our ears? I venture to dismiss that possibility decisively.

If we can get no further with what is common to dreams, let us see whether their differences can help us. Dreams are, of course, often senseless, confused and absurd; but there are also sensible, matter-of-fact, and reasonable ones. Let us enquire whether the latter, the sensible ones, can throw any light on the senseless ones. Here is the latest reasonable dream that I have had reported to me. It was dreamt by a young man: 'I went for a walk along the Kärntnerstrasse and met Herr X. there and joined him for a time. Then I went into a restaurant. Two ladies and a gentleman came and sat at my table. I was annoyed at this to begin with and wouldn't look at them. Then I did look and found that they were quite nice.' The dreamer commented on this that on the evening before the dream he had in fact walked along the Kärntnerstrasse, which is the way he usually goes, and had met Herr X. there. The other part of the dream was not a direct recollection, and only had some similarity to an experience a considerable time earlier. Or here is another matter-of-fact dream, this time a lady's: 'Her husband asked her: "Don't you think we ought to have the piano tuned?" And she replied: "It's not worth while; the hammers need reconditioning in any case."' This dream repeated, without much alteration, a conversation which had taken place between her and her husband the day before the dream. What do we learn from these two reasonable dreams? Nothing except that they contain repetitions from daily life or things connected with it. That would already be something, if it could be said of dreams generally. But there is no question of that; it applies only to a minority, and in most dreams there is no sign of a connection with the day before, and no light is thrown by this on the senseless and absurd dreams. It only shows that we have come upon a new task. We not only want to know what a dream says, but, if it speaks clearly, as it does in these examples of ours, we also want to know why and for what purpose this familiar material, only recently experienced, has been repeated in the dream.

I think that, like me, you must be tired of pursuing enquiries like those we have so far been making. All one's interest in a problem is evidently insufficient unless one knows as well of a path of approach that will lead to its solution. We have not yet found such a path. Experimental psychology has brought us nothing but some very valuable information on the significance of stimuli as instigators to dreaming. We have nothing to expect from philosophy except that it will once again haughtily point out to us the intellectual inferiority of the object of our study. Nor have we any wish to borrow anything from the occult sciences. History and popular opinion tell us that dreams have a sense and a meaning: that they look into the future - which is hard to accept and certainly incapable of proof. So our first effort leaves us completely at a loss.

Unexpectedly, a hint reaches us from a direction in which we have not so far looked. Linguistic usage, which is no chance thing, but the precipitate of old discoveries, though, to be sure, it must not be employed incautiously - our language, then, is acquainted with things that bear the strange name of 'day dreams'. Day-dreams are phantasies (products of the imagination); they are very general phenomena, observable, once more, in healthy as well as in sick people, and are easily accessible to study in our own mind. The most remarkable thing about these imaginative structures is that they have been given the name of 'day-dreams', for there is no trace in them of the two things that are common to dreams. Their relation to sleep is already contradicted by their name; and, as regards the second thing common to dreams, we do not experience or hallucinate anything in them but imagine something, we know that we are having a phantasy, we do not see but think. These day-dreams appear in the prepubertal period, often in the later part of childhood even; they persist until maturity is reached and are then either given up or maintained till the end of life. The content of these phantasies is dominated by a very transparent motive. They are scenes and events in which the subject's egoistic needs of ambition and power or his erotic wishes and satisfaction. In young men the ambitious phantasies are the most prominent, in women, whose ambition is directed to success in love, the erotic ones. But in men, too, erotic needs are often enough present in the background: all their heroic deeds and successes seem only to aim at courting the admiration and favour of women. In other respects these day-dreams are of many different kinds and pass through changing vicissitudes. They are either, each one of them, dropped after a short time and replaced by a fresh one, or they are retained, spun out into long stories and adapted to the changes in the circumstances of the subject's life. They go along with the times, so to speak, and receive a 'date stamp' which bears witness to the influence of the new situation. They are the raw material of poetic production, for the creative writer uses his day-dreams, with certain remodellings, disguises and omissions, to construct the situations which he introduces into his short stories, his novels or his plays. The hero of the day dreams is always the subject himself, either directly or by an obvious identification with someone else.

It may be that day-dreams bear their name on account of having the same relation to reality - in order to indicate that their content is to be looked on as no less unreal than that of dreams. But perhaps they share this name because of some psychical characteristic of dreams which is still unknown to us, one which we are in search of. It is also possible that we are being quite wrong in trying to make use of this similarity of name as something significant. Only later will it be possible to clear this up.

LECTURE VI

THE PREMISES AND TECHNIQUE OF INTERPRETATION

LADIES AND GENTLEMEN, - What we need, then, is a new path, a method which will enable us to make a start in the investigation of dreams. I will put a suggestion to you which presents itself. Let us take it as a premiss from this point onwards that *dreams are not somatic but psychical phenomena*. You know what that means, but what justifies our making the assumption? Nothing: but there is nothing either to prevent our making it. Here is the position: if dreams are somatic phenomena they are no concern of ours, they can only interest us on the assumption that they are mental phenomena. We will therefore work on the assumption that they really are, to see what comes of it. The outcome of our work will decide whether we are to hold to this assumption and whether we may then go on to treat it in turn as a proved finding. But what is it actually that we want to arrive at? What is our work aiming at? We want something that is sought for in all scientific work - to understand the phenomena, to establish a correlation between them and, in the latter end, if it is possible, to enlarge our power over them.

We proceed with our work, accordingly, on the supposition that dreams are psychical phenomena. In that case they are products and utterances of the dreamer's, but utterances which tell us nothing, which we do not understand. Well, what do you do if I make an unintelligible utterance to you? You question me, is that not so? Why should we not do the same thing to the dreamer - *question him as to what his dream means?*

As you will remember, we found ourselves in this situation once before. It was while we were investigating certain parapraxes - a case of a slip of the tongue. Someone had said: 'Then facts came to *Vorschwein*' and we thereupon asked him - no, it was luckily not we but some other people who had no connection at all with psycho-analysis - these other people, then, asked him what he meant by this unintelligible remark. And he replied at once that he had intended to say 'these facts were *Schweinereien* [disgusting]', but had forced this intention back in favour of the milder version 'then facts came to *Vorschein* [light]'. I pointed out to you at the time that this piece of information was the model for every psycho-analytic investigation, and you will understand now that psycho-analysis follows the technique of getting the people under examination so far as possible themselves to produce the solution of their riddles. Thus, too, it is the dreamer himself who should tell us what his dream means.

But, as we know, things are not so simple with dreams. With parapraxes it worked all right in a number of cases; but then others came along in which the person who was questioned would say nothing, and even indignantly rejected the answer we proposed to him. With dreams cases of the first sort are entirely lacking; the dreamer always says he knows nothing. He cannot reject our interpretation as we have none to offer him. Are we to give up our attempt then? Since he knows nothing and we know nothing and a third person could know even less, there seems to be no prospect of finding out. If you feel inclined, then, give up the attempt! But if you feel otherwise, you can accompany me further. For I can assure you that it is quite possible, and highly probable indeed, that the dreamer *does* know what his dream means: *only that he does not know that he knows it and for that reason thinks that he does not know it.*

You will point out to me that I am once more introducing an assumption, the second already in this short argument, and that in doing so I am enormously reducing my procedure's claim to credibility: 'Subject to the premiss that dreams are psychical phenomena, and subject to the further premiss that there are mental things in a man which he knows without knowing that he knows them.' and so on. If so, one has only to consider the internal improbability of each of these two premisses, and one can quietly divert one's interest from any conclusions that may be based on them.

I have not brought you here, Ladies and Gentlemen, to delude you or to conceal things from you. In my prospectus, it is true, I announced a course of 'Elementary Lectures to Serve as an Introduction to Psycho-Analysis', but what I had in mind was nothing in the nature of a presentation *in usum Delphini*,¹ which would give you a smooth account with all the difficulties carefully concealed, with the gaps filled in and the doubts glossed over, so that you might believe with an easy mind that you had learnt something new. No, for the very reason of your being beginners. I wanted to show you our science as it is, with its unevennesses and roughnesses, its demands and hesitations. For I know that it is the same in all sciences and cannot possibly be otherwise, especially in their beginnings. I know also that ordinarily instruction is at pains to start out by concealing such difficulties and incompletenesses from the learner. But that will not do for psycho-analysis. So I have in fact laid down two premisses, one within the other; and if anyone finds the whole thing too laborious and too insecure, or if anyone is accustomed to higher certainties and more elegant deductions, he need go no further with us. I think, however, that he should leave psychological problems entirely alone, for it is to be feared that in this quarter he will find impassable the precise and secure paths which he is prepared to follow. And, for a science which has something to offer, there is no necessity to sue for a hearing and for followers. Its findings are bound to canvass on its behalf and it can wait until these have compelled attention to it.

But for those who would like to persist in the subject, I can point out that my two assumptions are not on a par. The first, that dreams are psychical phenomena, is the premiss which we seek to prove by the outcome of our work; the second one has already been proved in another field, and I am merely venturing to bring it over from there to our own problems.

Where, then, in what field, can it be that proof has been found that there is knowledge of which the person concerned nevertheless knows nothing, as we are proposing to assume of dreamers? After all, this would be a strange, surprising fact and one which would alter our view of mental life and which would have no need to hide itself: a fact, incidentally, which cancels itself in its very naming and which nevertheless claims to be something real - a contradiction in terms. Well, it does not hide itself. It is not its fault if people know nothing about it or do not pay enough attention to it. Any more than we are to blame because judgement is passed on all these psychological problems by people who have kept at a distance from all the observations and experiences which are decisive on the matter.

¹ ['For the use of the Dauphin' - an edition of the Classics prepared for his son by order of Louis XIV: 'bowdlerized'.]

The proof was found in the field of hypnotic phenomena. When, in 1889, I took part in the extraordinarily impressive demonstrations by Liébeault and Bernheim at Nancy, I witnessed the following experiment among others. If a man was put into a state of somnambulism, was made to experience all kinds of things in a hallucinatory manner, and was then woken up, he appeared at first to know nothing of what had happened during his hypnotic sleep. Bernheim then asked him straight out to report what had happened to him under hypnosis. The man maintained that he could remember nothing. But Bernheim held out against this, brought urgent pressure to bear on him, insisted that he knew it and must remember it. And, lo and behold! the man grew uncertain, began to reflect, and recalled in a shadowy way one of the experiences that had been suggested to him, and then another piece, and the memory became clearer and clearer and more and more complete, and finally came to light without a break. Since, however, he knew afterwards what had happened and had learnt nothing about it from anyone else in the interval, we are justified in concluding that he had known it earlier as well. It was merely inaccessible to him; he did not know that he knew it and thought he did not know it. That is to say, the position was exactly the same as what we suspected in our dreamer.

I hope you will be surprised that this fact has been established and will ask me: 'Why did you omit to bring this proof forward earlier, in connection with the parapraxes, when we came to the point of attributing to a man who had made a slip of the tongue an intention to say things of which he knew nothing and which he denied? If a person thinks he knows nothing of experiences the memory of which he nevertheless has within him, it is no longer so improbable that he knows nothing of other mental processes within him. This argument would certainly have impressed us, and helped us to understand parapraxes.' Of course I could have brought it forward then, but I reserved it for another place, where it was more needed. The parapraxes explained themselves in part, and in part left us with a suggestion that, in order to preserve the continuity of the phenomena concerned, it would be wise to assume the existence of mental processes of which the subject knows nothing. In the case of dreams we are compelled to bring in explanations from elsewhere and moreover I expect that in their case you will find it easier to accept my carrying over of the explanations from hypnosis. The state in which a parapraxis occurs is bound to strike you as being the normal one; it has no similarity with the hypnotic state. On the other hand there is an obvious kinship between the hypnotic state and the state of sleep, which is a necessary condition of dreaming. Hypnosis, indeed, is described as an artificial sleep. We tell the person we are hypnotizing to sleep, and the suggestions we make are comparable to the dreams of natural sleep. The psychical situations in the two cases are really analogous. In natural sleep we withdraw our interest from the whole external world; and in hypnotic sleep we also withdraw it from the whole world, but with the single exception of the person who has hypnotized us and with whom we remain in rapport. Incidentally, the sleep of a nursing mother, who remains in rapport with her child and can be woken only by him, is a normal counterpart of hypnotic sleep. So it scarcely seems a very bold venture to transpose a situation from hypnosis to natural sleep. The assumption that in a dreamer too a knowledge about his dreams is present, though it is inaccessible to him so that he himself does not believe it, is not something entirely out of the blue. It should be noticed, moreover, that a third line of approach to the study of dreams is opened at this point: from the stimuli which disturb sleep, from day-dreams, and now in addition from the suggested dreams of the hypnotic state.

We may now go back to our task with increased confidence perhaps. It is very probable, then, that the dreamer knows about his dream; the only question is how to make it possible for him to discover his knowledge and communicate it to us. We do not require him to tell us straight away the sense of his dream, but he will be able to find its origin, the circle of thoughts and interests from which it sprang. You will recall that in the case of the parapraxis the man was asked how he had arrived at the wrong word '*Vorschwein*' and the first thing that occurred to him gave us the explanation. Our technique with dreams, then, is a very simple one, copied from this example. We shall once more ask the dreamer how he arrived at the dream, and once more his first remark is to be looked on as an explanation. Thus we disregard the distinction between his thinking or not thinking that he knows something, and we treat both cases as one and the same.

This technique is certainly very simple, but I fear it will rouse your liveliest opposition. You will say: 'A fresh assumption! the third! And the most unlikely of all! If I ask the dreamer what occurs to him in connection with the dream, is precisely the first thing that occurs to him going to bring the explanation we are hoping for? But nothing at all may occur to him, or heaven knows what may occur to him. I cannot see what an expectation of that kind is based on. That is really showing too much trust in Providence at a point where rather more exercise of the critical faculty would be appropriate. Besides, a dream is not a single wrong word; it consists of a number of elements. So which association are we to take up?'

You are correct on all your minor points. A dream differs from a slip of the tongue, among other things, in the multiplicity of its elements. Our technique must take this into account. I therefore suggest to you that we should divide the dream into its elements and start a separate enquiry into each element; if we do this, the analogy with a slip of the tongue is re-established. You are also right in thinking that when the dreamer is questioned about the separate elements of the dream he may reply that nothing occurs to him. There are some instances in which we let this reply pass, and you will later hear which these are; strangely enough, they are instances in which definite ideas may occur to us ourselves. But in general if the dreamer asserts that nothing occurs to him we contradict him; we bring urgent pressure to bear on him, we insist that something must occur to him - and we turn out to be right. He will produce an idea - some idea, it is a matter of indifference to us which. He will give us certain pieces of information, which may be described as 'historical', with particular ease. He may say: 'That's something that happened yesterday' (as was the case in our two 'matter-of-fact' dreams), or: 'That reminds me of something that happened a short time ago' - and we shall discover in this way that dreams are connected with impressions of the last day or two much more often than we thought to begin with. And finally he will also recall, starting from the dream, events from further back and even perhaps from the far distant past.

But on your main point you are wrong. If you think it is arbitrary to assume that the first thing that occurs to the dreamer is bound to bring what we are looking for or to lead us to it, if you think that what occurs to him might be anything in the world and might have no connection with what we are looking for, and that it is only exhibiting my trust in Providence if I expect something different - then you are making a great mistake. Once before I ventured to tell you that you nourish a deeply rooted faith in undetermined psychical events and in free will, but that this is quite unscientific and must yield to the demand of a determinism whose rule extends over mental life. I beg you to respect it as a fact that *that* is what occurred to the man when he was questioned and nothing else. But I am not opposing one faith with another. It can be proved that the idea produced by the man was not arbitrary nor indeterminable nor unconnected with what we were looking for. Indeed, not long ago I learnt - without, I may say, attaching too much importance to the fact - that experimental psychology too had brought up evidence to that effect.

In view of the importance of the matter, I will ask for your special attention. If I ask someone to tell me what occurs to him in response to a particular element of a dream, I am asking him to surrender himself to free association *while keeping an idea in mind as a starting point*. This calls for a special attitude of the attention which is quite different from reflection and which excludes reflection. Some people achieve this attitude with ease; others show an incredibly high degree of clumsiness when they attempt it. There is, however, a higher degree of freedom of association: that is to say, I may drop the insistence on keeping an initial idea in mind and only lay down the sort or kind of association I want - I may, for instance, require the experimenter to allow a proper name or a number to occur to him freely. What then occurs to him would presumably be even more arbitrary and more indeterminable than with our own technique. It can be shown, however, that it is always strictly determined by important internal attitudes of mind which are not known to us at the moment at which they operate - which are as little known to us as the disturbing purposes of parapraxes and the provoking ones of chance actions.

I and many others after me have repeatedly made such experiments with names and numbers thought of at random, and a few of these have been published. Here the procedure is to produce a series of associations to the name which has emerged; these latter associations are accordingly no longer completely free but have a link, like the associations to the elements of dreams. One continues doing this until one finds the impulse exhausted. But by then light will have been thrown both on the motive and the meaning of the random choice of the name. These experiments always lead to the same result; reports on them often cover a wealth of material and call for extensive expositions. The associations to *numbers* chosen at random are perhaps the most convincing; they run off so quickly and proceed with such incredible certainty to a hidden goal that the effect is really staggering. I will give you only one example of an analysis like this of a name, since dealing with it calls for a conveniently small amount of material.

In the course of treating a young man I had occasion to discuss this topic, and mentioned the thesis that, in spite of an apparently arbitrary choice, it is impossible to think of a name at random which does not turn out to be closely determined by the immediate circumstances, the characteristics of the subject of the experiment and his situation at the moment. Since he was sceptical, I suggested that he should make an experiment of the kind himself on the spot. I knew that he carried on particularly numerous relationships of every kind with married women and girls, so I thought he would have a specially large choice open to him if it were to be a woman's name that he was asked to choose. He agreed to this. To my astonishment, or rather, perhaps, to his, no avalanche of women's names broke over me; he remained silent for a moment and then admitted that only a single name had come into his head and none other besides: 'Albine'. - How curious! But what does that name mean to you? How many 'Albines' do you know? - Strange to say, he knew no one called 'Albine' and nothing further occurred to him in response to the name. So it might be thought that the analysis had failed. But not at all: it was already complete, and no further associations were needed. The man had an unusually fair complexion and in conversation during the treatment I had often jokingly called him an albino. We were engaged at the time in determining the feminine part of his constitution. So it was he himself who was this 'Albine', the woman who was the most interesting to him at the moment.

In the same way tunes that come into one's head without warning turn out to be determined by and to belong to a train of thought which has a right to occupy one's mind though without one's being aware of its activity. It is easy to show then that the relation to the tune is based on its text or its origin. But I must be careful not to extend this assertion to really musical people, of whom, as it happens, I have had no experience. It may be that for such people the musical content of the tune is what decides its emergence. The earlier case is certainly the commoner one. I know of a young man, for instance, who was positively persecuted for a time by the tune (incidentally a charming one) of Paris's song in *La belle Hélène*, till his analysis drew his attention to a contemporary competition in his interest between an 'Ida' and a 'Helen'.

If then things that occur to one quite freely are determined in this way and form parts of a connected whole, we shall no doubt be justified in concluding that things that occur to one with a single link - namely their link with the idea which serves as their starting-point - cannot be any less determined. Investigation shows, in fact, that, apart from the link we have given them with the initial idea, they are found to be dependent as well on groups of strongly emotional thoughts and interests, 'complexes', whose participation is not known at the moment - that is to say, is unconscious.

The occurrence of ideas with links of this kind has been the subject of very instructive experimental researches, which have played a notable part in the history of psycho-analysis. The school of Wundt had introduced what are known as association-experiments, in which a *stimulus word* is called out to the subject and he has the task of replying to it as quickly as possible with any *reaction* that occurs to him. It is then possible to study the interval that passes between the stimulus and the reaction, the nature of the answer given as a reaction, possible errors when the same experiment is repeated later, and so on. The Zurich school, led by Bleuler and Jung, found the explanation of the reactions that followed in the association-experiment by getting the subjects to throw light on their reactions by means of subsequent associations, if those reactions had shown striking features. It then turned out that these striking reactions were determined in the most definite fashion by the subject's complexes. In this manner Bleuler and Jung built the first bridge from experimental psychology to psycho-analysis.

Having learnt thus much, you will be able to say: 'We acknowledge now that thoughts that occur to one freely are determined and not arbitrary as we supposed. We admit that this is also true of thoughts occurring in response to the elements of dreams. But that is not what we are concerned with. You assert that what occurs to the dreamer in response to the dream-element will be determined by the psychical background (unknown to us) of that particular element. This does not seem to us to be proved. We quite expect that what occurs to the dreamer in response to the dream-element will turn out to be determined by one of the dreamer's complexes, but what good does that do us? This does not lead us to an understanding of dreams but, like the association-experiment, to a knowledge of these so-called complexes. But what have they got to do with dreams?'

You are right, but you are overlooking one factor. Moreover it is precisely the factor on account of which I did not choose the association-experiment as the starting-point of this exposition. In that experiment the single determinant of the reaction - that is, the stimulus-word - is arbitrarily chosen by us. The reaction is in that case an intermediary between the stimulus-word and the complex which has been aroused in the subject. In dreams the stimulus-word is replaced by something that is itself derived from the dreamer's mental life, from sources unknown to him, and may therefore very easily itself be a 'derivative of a complex'. It is therefore not precisely fantastic to suppose that the further associations linked to the dream-elements will be determined by the same complex as that of the element itself and will lead to its discovery.

Let me show you from another instance that the facts are as we expect. The forgetting of proper names is actually an excellent model of what happens in dream-analysis; the difference is only that events that are shared between two people in dream-analysis are combined in a single person in the parapraxis. If I forget a name temporarily, I nevertheless feel in myself a certainty that I know it - a certainty which in the case of the dreamer we only arrived at by the round-about path of the Bernheim experiment. The name which I have forgotten but which I know is, however, not accessible to me. Experience soon teaches me that thinking about it, with however much effort, is of no help. But in place of the forgotten name I can always call up one or several substitute names. It is only after a substitute name of this kind has occurred to me spontaneously that the conformity of this situation with that of dream-interpretation becomes obvious. Like this substitute name, the dream-element is not the right thing, but only takes the place of something else - of the genuine thing which I do not know and which I am to discover by means of the dream-analysis. The difference is once more only that in the case of forgetting the name, I recognize the substitute unhesitatingly as something ungentle, whereas we had to acquire this view laboriously in the case of the dream-element. Now in the case of forgetting a name there is also a method by which we can start from the substitute and arrive at the unconscious genuine thing, the forgotten name. If I direct my attention to the substitute names and allow further ideas in response to them to occur to me, I arrive by shorter or longer detours at the forgotten name, and I find when this happens that both the spontaneous substitute name and the ones that I have called up are connected with the forgotten one and were determined by it.

I will describe an analysis of this kind to you. I noticed one day that I could not recall the name of the small country on the Riviera, of which Monte Carlo is the chief town. It was very tiresome, but so it was. I summoned up all that I knew about that country. I thought of Prince Albert of the House of Lusignan, of his marriages, of his devotion to deep-sea researches, and everything else I could bring together, but it was of no avail. So I gave up reflection and allowed substitute names to occur to me instead of the lost one. They came rapidly: Monte Carlo itself, then Piedmont, Albania, Montevideo, Colico. Of this series I was struck first by Albania, which was at once replaced by Montenegro, no doubt because of the contrast between white and black.¹ I then saw that four of these substitute names contained the same syllable 'mon', then suddenly I had the forgotten word and exclaimed aloud: 'Monaco!' So the substitute names had in fact arisen from the forgotten one: the first four came from its first syllable while the last reproduced its syllabic structure and its whole last syllable. Moreover I was able to discover quite easily what it was that had temporarily deprived me of the name. Monaco is also the Italian name for Munich; and it was that town which exerted the inhibitory influence.

No doubt this example is a good one, but it is too simple. In other cases it would have been necessary to call up a longer string of ideas in response to the first substitute name, and then the analogy with dream-analysis would have been clearer. I have had experiences of that sort too. On one occasion a stranger had invited me to drink some Italian wine with him, but when we were in the inn it turned out that he had forgotten the name of the wine which he intended to order because of his very agreeable recollections of it. From a quantity of substitute ideas of different kinds which came into his head in place of the forgotten name, I was able to infer that thoughts about someone called Hedwig had made him forget the name. And he not only confirmed the fact that he had first tasted this wine when he was with someone of that name, but with the help of this discovery he recalled the name of the wine. He was happily married at the present time and this Hedwig belonged to earlier days which he had no wish to remember.

But if it is possible in the case of forgetting a name, it must also be possible in interpreting dreams to proceed from the substitute along the chain of associations attached to it and so to obtain access to the genuine thing which is being held back. From the example of the forgotten name we may conclude that the associations to the dream-element will be determined both by the dream-element and also by the unconscious genuine thing behind it. In this way, then, we seem to have produced some justification of our technique.

¹ [*Albus* the Latin for 'white', and *'negro'* the Spanish or Portuguese for 'black'.]

LECTURE VII

THE MANIFEST CONTENT OF DREAMS AND THE LATENT DREAM-THOUGHTS

LADIES AND GENTLEMEN, - As you see, our study of parapraxes has not been unprofitable. Thanks to our labours over them we have, subject to the premisses I have explained to you, achieved two things: a conception of the nature of dream-elements and a technique for interpreting dreams. The conception of dream-elements tells us that they are unguenuine things, substitutes for something else that is unknown to the dreamer (like the purpose of a parapraxis), substitutes for something the knowledge of which is present in the dreamer but which is inaccessible to him. We are in hopes that it will be possible to carry over the same conception to whole dreams, which are made up of such elements. Our technique lies in employing free association to these elements in order to bring about the emergence of other substitutive structures, which will enable us to arrive at what is concealed from view.

I now propose that we should introduce a change into our nomenclature which will give us more freedom of movement. Instead of speaking of 'concealed', 'inaccessible', or 'ungenuine', let us adopt the correct description and say 'inaccessible to the dreamer's consciousness' or '*unconscious*'. I mean nothing else by this than what may be suggested to you when you think of a word that has escaped you or the disturbing purpose in a parapraxis - that is to say, I mean nothing else than '*unconscious at the moment*'. In contrast to this, we can of course speak of the dream-elements themselves, and the substitutive ideas that have been newly arrived at from them by association, as '*conscious*'. This nomenclature so far involves no theoretical construction. No objection can be made to using the word '*unconscious*' as an apt and easily understandable description.

If we carry over our conception of the separate elements to the whole dream, it follows that the dream as a whole is a distorted substitute for something else, something unconscious, and that the task of interpreting a dream is to discover this unconscious material. From this, however, there at once follow three important rules, which we must obey during the work of interpreting dreams.

(1) We must not concern ourselves with what the dream *appears* to tell us, whether it is intelligible or absurd, clear or confused, since it cannot possibly be the unconscious material we are in search of. (An obvious limitation to this rule will force itself on our notice later.) (2) We must restrict our work to calling up the substitutive ideas for each element, we must not reflect about them, or consider whether they contain anything relevant, and we must not trouble ourselves with how far they diverge from the dream-element. (3) We must wait till the concealed unconscious material we are in search of emerges of its own accord, exactly as the forgotten word 'Monaco' did in the experiment I have described.

Now, too, we can understand to what extent it is a matter of indifference how much or how little the dream is remembered and, above all, how accurately or how uncertainly. For the remembered dream is not the genuine material but a distorted substitute for it, which should assist us, by calling up other substitutive images, to come nearer to the genuine material, to make what is unconscious in the dream conscious. If our memory has been inaccurate, therefore, it has merely made a further distortion of this substitute - a distortion, moreover, which cannot have been without a reason.

The work of interpreting can be performed on one's own dreams just as on other people's. In fact one learns more from one's own: the process carries more conviction. If, then, we make the attempt, we notice that something is opposing our work. It is true that ideas occur to us, but we do not allow all of them to count; testing and selecting influences make themselves felt. In the case of one idea we may say to ourselves: 'No, this is not relevant, it does not belong here'; in the case of another: 'this is too senseless' and of a third: 'this is totally unimportant'. And we can further observe how with objections of this sort we may smother ideas and finally expel them altogether, even before they have become quite clear. Thus on the one hand we keep too close to the idea which was our starting point, the dream-element itself; and on the other hand we interfere with the outcome of the free associations by making a selection. If we are not by ourselves while interpreting the dream, if we get someone else to interpret it, we become very clearly aware of yet another motive which we employ in making this illicit selection, for sometimes we say to ourselves: 'No, this idea is too disagreeable; I will not or cannot report it.'

These objections are obviously a threat to the success of our work. We must guard against them, and in our own case we do so by firmly resolving not to give way to them. If we are analysing someone else's dream, we do so by laying it down as an inviolable rule that he must not hold back any idea from us, even if it gives rise to one of the four objections - of being too unimportant or too senseless or of being irrelevant or too distressing to be reported. The dreamer promises to obey the rule, and we may be annoyed afterwards to find how badly he keeps his promise when the occasion arises. We may explain this to ourselves to begin with by supposing that, in spite of our authoritative assurance, he has not yet realized the justification for free association, and we may perhaps have the notion of first convincing him theoretically by giving him books to read or by sending him to lectures which may convert him into a supporter of our views on free association. But we shall be held back from blunders like this when we consider that in the case of ourselves, as to the strength of whose convictions we can, after all, hardly be in doubt, the same objections arise to certain ideas and are only set aside subsequently - by a court of appeal, as it were.

Instead of being annoyed by the dreamer's disobedience, we may take advantage of these experiences by learning something new from them - something which is all the more important the less we are expecting it. We perceive that the work of interpreting dreams is carried out in the face of a *resistance*, which opposes it and of which the critical objections are manifestations. This resistance is independent of the dreamer's theoretical conviction. We learn still more, indeed. We discover that a critical objection of this kind never turns out to be justified. On the contrary, the ideas which people try to suppress in this way turn out *invariably* to be the most important ones and those which are decisive in our search for the unconscious material. It amounts, in fact, to a special distinguishing mark, if an idea is accompanied by an objection like this.

This resistance is something entirely new: a phenomenon which we have come upon in connection with our premisses, but one which was not included among them. The appearance of this new factor in our reckoning comes to us as a not altogether pleasant surprise. We suspect at once that it is not going to make our work any easier. It might mislead us into abandoning our whole concern with dreams: something so unimportant as a dream and, on top of that, all these difficulties instead of a simple straightforward technique! But, on the other hand, the difficulties might act precisely as a stimulus and make us suspect that the work will be worth the trouble. We regularly come up against resistance when we try to make our way forward from the substitute which is the dream-element to the unconscious material hidden behind it. So we may conclude that there must be something of importance concealed behind the substitute. Otherwise, what is the point of the difficulties that are trying to keep the concealment going? If a child refuses to open his clenched fist to show what he has in it, we may feel sure that it is something wrong - something he ought not to have.

The moment we introduce the dynamic idea of a resistance into the facts of the case, we must simultaneously reflect that this factor is something variable in quantity. There may be greater and smaller resistances, and we are prepared to find these differences showing themselves during our work as well. We may perhaps be able to link with this another experience we also meet with during the work of interpreting dreams: sometimes it requires only a single response, or no more than a few, to lead us from a dream-element to the unconscious material behind it, while on other occasions long chains of associations and the overcoming of many critical objections are required for bringing this about. We shall conclude that these differences relate to the changing magnitude of the resistance, and we shall probably turn out to be right. If the resistance is small, the substitute cannot be far distant from the unconscious material; but a greater resistance means that the unconscious material will be greatly distorted and that the path will be a long one from the substitute back to the unconscious material.

And now perhaps it is time to take a dream and try our technique upon it and see whether our expectations are confirmed. Yes, but what dream are we to choose for the purpose: You cannot imagine how hard I find it to decide; nor can I yet make the nature of my difficulties plain to you. There must obviously be dreams which have on the whole been subjected to only a little distortion, and the best plan would be to begin with them. But what dreams have been least distorted? The ones that are intelligible and not confused, two examples of which I have already put before you? That would be leading us quite astray. Investigation shows that such dreams have been subjected to an extraordinarily high degree of distortion. If, however, I were to disregard particular requirements and were to select a dream at haphazard, you would probably be greatly disappointed. We might have to notice or record such a profusion of ideas in response to the separate dream-elements that we should be unable to make head or tail of the work. If we write down a dream and then make a note of all the ideas that emerge in response to it, these may prove to be many times longer than the text of the dream. The best plan would therefore seem to be to choose out a number of short dreams for analysis, each of which will at least tell us something or confirm some point. So we will make up our minds to take that course, unless experience may perhaps show us where we can really find dreams that have been only slightly distorted.

I can however think of something else that will make things easier for us - something, moreover, which lies along our path. Instead of starting on the interpretation of *whole* dreams, we will restrict ourselves to a few dream-elements, and we will trace out in a number of examples how these can be explained by applying our technique to them.

(a) A lady reported that she very often dreamt when she was a child that *God wore a paper cocked-hat on his head*. What can you make of that without the dreamer's help? It sounds completely nonsensical. But it ceases to be nonsense when we hear from the lady that she used to have a hat of that sort put on her head at meals when she was a child, because she could never resist taking furtive glances at her brothers' and sisters' plates to see whether they had been given larger helpings than she had. So the hat was intended to act like a pair of blinkers. This, incidentally, was a piece of historical information and was given without any difficulty. The interpretation of this element and at the same time of the whole short dream was easily made with the help of a further idea that occurred to the dreamer: 'As I had heard that God was omniscient and saw everything', she said, 'the dream can only mean that I knew everything and saw everything, even though they tried to prevent me.' Perhaps this example is too simple.

(b) A sceptical woman patient had a longish dream in the course of which some people told her about my book on jokes and praised it highly. Something came in then about a 'a *channel*', *perhaps it was another book that mentioned a channel, or something else about a channel . . . she didn't know . . . it was all so indistinct*.

No doubt you will be inclined to expect that the element 'channel', since it was so indistinct, would be inaccessible to interpretation. You are right in suspecting a difficulty; but the difficulty did not arise from the indistinctness: both the difficulty and the indistinctness arose from another cause. Nothing occurred to the dreamer in connection with 'channel', and I could of course throw no light on it. A little later - it was the next day, in point of fact - she told me that she had thought of something that *might* have something to do with it. It was a joke, too, - a joke she had heard. On the steamer between Dover and Calais a well-known author fell into conversation with an Englishman. The latter had occasion to quote the phrase: 'Du sublime au ridicule il n'y a qu'un pas. [It is only a step from the sublime to the ridiculous.]' 'Yes,' replied the author, '*le Pas de Calais*' - meaning that he thought France sublime and England ridiculous. But the *Pas de Calais* is a channel - the English Channel. You will ask whether I think this had anything to do with the dream. Certainly I think so; and it provides the solution of the puzzling element of the dream. Can you doubt that this joke was already present before the dream occurred, as the unconscious thought behind the element 'channel'? Can you suppose that it was introduced as a subsequent invention? The association betrayed the scepticism which lay concealed behind the patient's ostensible admiration; and her resistance against revealing this was no doubt the common cause both of her delay in producing the association and of the indistinctness of the dream-element concerned. Consider the relation of the dream-element to its unconscious background: it was, as it were, a fragment of the background, an allusion to it, but it was made quite incomprehensible by being isolated.

(c) As part of a longish dream a patient dreamt that *several members of his family were sitting round a table of peculiar shape*, etc. It occurred to him in connection with the table that he had seen a piece of furniture of the kind when he was on a visit to a particular family. His thoughts then went on to say that there was a peculiar relationship between the father and son in this family; and he soon added that the same thing was true of the relationship between himself and his own father. So the table had been taken into the dream in order to point out this parallel.

This dreamer had been long familiar with the requirement of dream-interpretation. Another person might perhaps have taken objection to such a trivial detail as the shape of a table being made the subject of investigation. But in fact we regard nothing in a dream as accidental or indifferent, and we expect to obtain information precisely from the explanation of such trivial and pointless details. You may perhaps also feel surprised that the thought that 'the same thing was true of us and of them' should have been expressed by, in particular, the choice of a table [*Tisch*]. But this too becomes clear when you learn that the name of the family in question was *Tischler* [literally, 'carpenter']. By making his relations sit at this *Tisch*, he was saying that they too were *Tischlers*. Incidentally, you will notice how inevitably one is led into being indiscreet when one reports these dream-interpretations. And you will guess that this is one of the difficulties I have hinted at over the choice of examples. I could easily have taken another example in place of this one, but I should probably merely have avoided *this* indiscretion at the price of committing another.

The moment seems to me to have arrived for introducing two terms, which we could have made use of long ago. We will describe what the dream actually tells us as the *manifest dream-content*, and the concealed material, which we hope to reach by pursuing the ideas that occur to the dreamer, as the *latent dream-thoughts*. Thus we are here considering the relations between the manifest content of the dream and the latent dream-thoughts as shown in these examples. These relations may be of very many different kinds. In examples (a) and (b) the manifest element is also a constituent of the latent thoughts, though only a small fragment of them. A small piece of the large and complicated psychical structure of unconscious dream-thoughts has made its way into the manifest dream as well - a fragment of them, or, in other cases, an allusion to them, a caption, as it were, or an abbreviation in telegraphic style. It is the business of the work of interpretation to complete these fragments or this allusion into a whole - which was achieved particularly nicely in the case of example (b). Thus one form of the distortion which constitutes the dream-work is replacement by a fragment or an allusion. In example (c) another kind of relation is to be observed in addition; and we shall find this expressed in a purer and clearer form in the examples which follow.

(d) The dreamer was *pulling a lady* (a particular one, of his acquaintance) *out from behind a bed*. He himself found the meaning of this dream-element from the first idea that occurred to him. It meant that he was giving this lady preference.¹

¹ [This example, like the next, depends on a purely verbal point: the resemblance between the German words for 'pulling out' (*hervor ziehen*) and 'preferring' (*vorziehen*).]

(e) Another man dreamt that *his brother was in a box [Kasten]*. In his first response '*Kasten*' was replaced by '*Schrank* [cupboard]', and the second gave the interpretation: his brother was restricting himself [*'schränkt sich ein'*].

(f) The dreamer *climbed to the top of a mountain, which commanded an unusually extensive view*. This sounds quite rational and you might suppose that there is nothing to interpret in it and that all we have to do is to enquire what memory gave rise to the dream and the reason for its being stirred up. But you would be wrong. It turned out that this dream stood in need of interpreting just as much as any other, more confused one. For none of his own mountain climbs occurred to the dreamer, but he thought of the fact that an acquaintance of his was the editor of a '*Survey*', dealing with our relations with the most remote parts of the earth. Thus the latent dream-thought was an identification of the dreamer with the '*surveyor*',

Here we have a new type of relation between the manifest and latent dream-elements. The former is not so much a distortion of the latter as a representation of it, a plastic, concrete, portrayal of it, taking its start from the wording. But precisely on that account it is once more a distortion, for we have long since forgotten from what concrete image the word originated and consequently fail to recognize it when it is replaced by the image. When you consider that the manifest dream is made up predominantly of visual images and more rarely of thoughts and words, you can imagine what importance attaches to this kind of relation in the construction of dreams. You will see, too, that in this way it becomes possible in regard to a large number of abstract thoughts to create pictures to act as substitutes for them in the manifest dream while at the same time serving the purpose of concealment. This is the technique of the familiar picture-puzzles. Why it is that these representations have an appearance of being jokes is a special problem into which we need not enter here.

There is a fourth kind of relation between the manifest and latent elements, which I must continue to hold back from you until we come upon its key-word in considering technique. Even so I shall not have given you a full list; but it will serve our purpose.

Do you feel bold enough now to venture upon the interpretation of a *whole* dream? Let us make the experiment, to see whether we are well enough equipped for the task. I shall of course not select one of the most obscure ones; nevertheless, it will be one that gives a well-marked picture of the attributes of a dream.

Very well then. A lady who, though she was still young, had been married for many years had the following dream: *She was at the theatre with her husband. One side of the stalls was completely empty. Her husband had told her that Elisa L. and her fiancé had wanted to go too, but had only been able to get bad seats - three for 1 florin 50 kreuzers - and of course they could not take those. She thought it would not really have done any harm if they had.*

The first thing the dreamer reported to us was that the precipitating cause of the dream was touched on in its manifest content. Her husband had in fact told her that Elise L., who was approximately her contemporary, had just become engaged. The dream was a reaction to this information. We know already that it is easy in the case of many dreams to point to a precipitating cause like this from the previous day, and that the dreamer is often able to trace this for us without any difficulty. The dreamer in the present case put similar information at our disposal for other elements of the manifest dream as well. - Where did the detail come from about one side of the stalls being empty? It was an allusion to a real event of the previous week. She had planned to go to a particular play and had therefore bought her tickets *early* - so early that she had had to pay a booking fee. When they got to the theatre it turned out that her anxiety was quite uncalled-for, since *one side of the stalls was almost empty*. It would have been early enough if she had bought the tickets on the actual day of the performance. Her husband had kept on teasing her for having been in too much of a hurry. - What was the origin of the 1 florin 50 kreuzers? It arose in quite another connection, which had nothing to do with the former one but also alluded to some information from the previous day. Her sister-in-law had been given a present of 150 florins by her husband and had been in a great hurry - the silly goose - to rush off to the jewellers' and exchange the money for a piece of jewellery. - Where did the 'three' come from? She could think of nothing in connection with that, unless we counted the idea that her newly-engaged friend, Elise L., was only three months her junior, though she herself had been a married woman for nearly ten years. - And the absurd notion of taking three tickets for only two people? She had nothing to say to that, and refused to report any further ideas or information.

But all the same, she had given us so much material in these few associations that it was possible to guess the latent dream-thoughts from them. We cannot help being struck by the fact that periods of time occur at several points in the information she gave us about the dream, and these provide a common factor between the different parts of the material. She took the theatre tickets *too early*, bought them *over-hurriedly* so that she had to pay more than was necessary; so too her sister-in-law had been *in a hurry* to take her money to the jewellers and buy some jewellery with it, as though otherwise she would *miss it*. If, in addition to the 'too early' and 'in a hurry' which we have stressed, we take into account the precipitating cause of the dream - the news that her friend, though only three months *her junior*, had nevertheless got an excellent husband - and the criticism of her sister-in-law expressed in the idea that it was *absurd* of her to be in such a hurry, then we find ourselves presented almost spontaneously with the following construction of the latent dream-thoughts, for which the manifest dream is a severely distorted substitute:

'Really it was *absurd* of me to be in such a hurry to get married! I can see from Elise's example that I could have got a husband later too.' (Being in too great a hurry was represented by her own behaviour in buying the tickets and by her sister-in-laws in buying the jewellery. Going to the play appeared as a substitute for forgetting married.) This would seem to be the main thought. We may perhaps proceed further, though with less certainty, since the analysis ought not to have been without the dreamer's comments at these points: 'And I could have got one a hundred times better with the money!' (150 florins is a hundred times more than 1 florin 50.) If we were to put her dowry in place of the money, it would mean that her husband was bought with her dowry: the jewellery, and the bad tickets as well, would be substitutes for her husband. It would be still more satisfactory if the actual element 'three tickets' had something to do with a husband. But we have not got so far as that in our understanding of the dream. We have only discovered that the dream expresses the *low value* assigned by her to her own husband and her regret at having *married so early*.

We shall, I fancy, be more surprised and confused than satisfied by the outcome of this first dream-interpretation. We have been given too much in one dose - more than we are yet able to cope with. We can already see that we shall not exhaust the lessons of this interpretation of a dream. Let us hasten to single out what we can recognize as established new discoveries.

In the first place, it is a remarkable thing that the main emphasis in the latent thoughts lies on the element of being in too great a hurry; nothing of the sort is to be found in the manifest dream. Without the analysis, we should have had no suspicion that that factor plays any part. It seems, therefore, to be possible for what is in fact the main thing, the centre of the unconscious thoughts, to be absent in the manifest dream. This means that the impression made by the whole dream must be fundamentally altered. In the second place, there is an absurd combination in the dream: three for 1 florin 50. We detected in the dream-thoughts the assertion that 'it was absurd (to marry so early)'. Can it be doubted that this thought, 'it was absurd', is represented by the inclusion of an absurd element in the manifest dream? And in the third place, a glance of comparison shows us that the relation between the manifest and latent elements is no simple one; it is far from being the case that one manifest element always takes the place of one latent one. It is rather that there is a group-relation between the two layers, within which one manifest element can replace several latent ones or one latent element can be replaced by several manifest ones.

As regards the meaning of the dream and the dreamer's attitude to it, we might point out much that is similarly surprising. She agreed to the interpretation indeed, but she was astonished at it. She was not aware that she assigned such a low value to her husband; nor did she know *why* she should set such a low value on him. So there is still much that is unintelligible about it. It really seems to me that we are not yet equipped for interpreting a dream and that we need first to be given some further instruction and preparation.

LECTURE VIII

CHILDREN'S DREAMS

LADIES AND GENTLEMEN, - I am under the impression that we have advanced too quickly. Let us go back a little. Before we made our last attempt at overcoming the difficulty of distortion in dreams by the help of our technique, we were saying that our best plan would be to get round the difficulty by keeping to dreams in which there was no distortion or only a very little - if such dreams exist. This will once more mean a divergence from the historical development of our discoveries; for actually it was only after the technique of interpretation had been consistently applied and distorted dreams had been completely analysed that the existence of dreams that are free from distortion came to our notice.

The dreams we are in search of occur in children. They are short, clear, coherent, easy to understand and unambiguous; but they are nevertheless undoubtedly dreams. You must not suppose, however, that all children's dreams are of this kind. Dream-distortion sets in very early in childhood, and dreams dreamt by children of between five and eight have been reported which bear all the characteristics of later ones. But if you limit yourselves to ages between the beginning of observable mental activity and the fourth or fifth year, you will come upon a number of dreams which possess the characteristics that can be described as 'infantile' and you will find a few of the same kind in later years of childhood. Indeed, under certain conditions even adults have dreams which are quite similar to the typically infantile ones.

From these children's dreams we can draw conclusions with great ease and certainty on the essential nature of dreams in general, and we can hope that those conclusions will prove decisive and universally valid.

(1) No analysis, no application of any technique is necessary in order to understand these dreams. There is no need to question a child who tells us his dream. One has, however, to add a piece of information to it from the events of the child's life. There is invariably some experience of the previous day which explains the dream to us. The dream is the reaction of the child's mental life in his sleep to this experience of the previous day.

We will take a few examples on which to base our further conclusions.

(a) A boy of 22 months was told to hand over a basket of cherries to someone as a birthday present. He was obviously very unwilling to do it, although he was promised that he should have a few of them for himself. Next morning he reported having dreamt: '*Hermann eaten all the chewwies!*'

(b) A girl of 3¼ years was taken across the lake for the first time. At the landing-stage she did not want to leave the boat and wept bitterly. The crossing had been too short for her. Next morning she announced: '*Last night I went on the lake.*' We may safely add that this crossing had lasted longer.

(c) A boy of 5¼ years was taken on an excursion up the Echerntal near Hallstatt. He had been told that Hallstatt was at the foot of the Dachstein. He had shown great interest in this mountain. There was a fine view of it from where he was staying at Aussee, and the Simony Hut on it could be made out through a telescope. The child had often tried to see it through the telescope - with what success was not known. The excursion began in an atmosphere of cheerful expectation. Whenever a fresh mountain came into view the boy asked: 'Is that the Dachstein?' and he became more and more depressed the more often he was told it was not. Finally he fell completely silent and refused to go with the rest of the party up the short ascent to the waterfall, and it was thought that he must be overtired. But next morning he said with a radiant face: '*Last night I dreamt we were at the Simony Hut.*' So that had been what he expected to do on the excursion. He gave no further details except something he had heard before: 'You have to climb up steps for six hours.'

These three dreams will give us all the information we require.

(2) As we can see, these children's dreams are not senseless. They are intelligible, completely valid mental acts. You will recall what I told you of the medical view of dreams and of the analogy with unmusical fingers wandering over the keys of a piano. You cannot fail to observe how sharply these children's dreams contradict this view. It would really be too strange if *children* could perform complete mental functions in their sleep while *adults* were content under the same conditions with reactions which were no more than 'twitchings'. Moreover, we have every reason to think that children's sleep is sounder and deeper.

(3) These dreams are without any dream-distortion, and therefore call for no interpretative activity. Here the manifest and the latent dream coincide. *Thus dream-distortion is not part of the essential nature of dreams.* I expect this will be a weight off your minds. But when we examine these dreams more closely, we shall recognize a small piece of dream-distortion even in them, a certain distinction between the manifest content of the dream and the latent dream-thoughts.

(4) A child's dream is a reaction to an experience of the previous day, which has left behind it a regret, a longing, a wish that has not been dealt with. *The dream produces a direct, undisguised fulfilment of that wish.* Let us recall now our discussions on the part played by somatic stimuli from outside and from within as disturbers of sleep and instigators of dreams. In that connection we came to know some quite undoubted facts, but by their means we were only able to explain a small number of dreams. In these children's dreams, however, there is nothing that points to the operation of somatic stimuli of that kind; we could not be mistaken in this, for the dreams are completely intelligible and easy to grasp. But this does not mean that we need abandon the stimulus aetiology of dreams. We can only ask how it has happened that from the first we have forgotten that besides somatic stimuli there are *mental* stimuli that disturb sleep. We know, after all, that it is excitations of this kind that are chiefly responsible for disturbing the sleep of an adult by preventing him from establishing the mood required for falling asleep - the withdrawing of interest from the world. He does not want to interrupt his life but would rather continue his work on the things he is concerned with, and for that reason he does not fall asleep. In the case of children, therefore, the stimulus that disturbs sleep is a mental one - the wish that has not been dealt with - and it is to this that they react with the dream.

(5) This gives us the most direct approach to understanding the function of dreams. In so far as a dream is a reaction to a psychical stimulus, it must be equivalent to dealing with the stimulus in such a way that it is got rid of and that sleep can continue. We do not yet know how this dealing with the stimulus by the dream is made possible dynamically, but we see already that *dreams are not disturbers of sleep*, as they are abusively called, but *guardians of sleep which get rid of disturbances of sleep*. We think we should have slept more soundly if there had been no dream, but we are wrong; in fact, without the help of the dream we should not have slept at all. It is due to it that we have slept as soundly as we have. It could not avoid disturbing us a little, just as the night-watchman often cannot help making a little noise while he chases away the disturbers of the peace who seek to waken us with their noise.

(6) What instigates a dream is a wish, and the fulfilment of that wish is the content of the dream - this is one of the chief characteristics of dreams. The other, equally constant one, is that a dream does not simply give expression to a thought, but represents the wish-fulfilled as a hallucinatory experience. '*I should like to go on the lake*' is the wish that instigates the dream. The content of the dream itself is: '*I am going on the lake*.' Thus even in these simple children's dreams a difference remains between the latent and the manifest dream, there is a distortion of the latent dream-thought: *the transformation of a thought into an experience*. In the process of interpreting a dream this alteration must first be undone. If this turns out to be the most universal characteristic of dreams, the fragment of dream which I reported to you earlier 'I saw my brother in a box [*Kasten*]' is not to be translated 'my brother is restricting himself [*schnärkt sich ein*]' but 'I should like my brother to restrict himself: *my brother must restrict himself*.' Of the two general characteristics of dreams which I have here brought forward, the second clearly has more prospect of being accepted without contradiction than the first. It is only by means of far-reaching investigations that we shall be able to establish the fact that what instigates dreams must always be a wish and cannot be a worry or an intention or a reproach; but this will not affect the other characteristic - that the dream does not simply reproduce this stimulus, but removes it, gets rid of it, deals with it, by means of a kind of experience.

(7) On the basis of these characteristics of dreams, we can return once more to a comparison between a dream and a parapraxis. In the latter we distinguished between a disturbing purpose and a disturbed one, and the parapraxis was a compromise between them. A dream can be fitted into the same pattern. The disturbed purpose can only be that of sleeping. We may replace the disturbing one by the psychical stimulus, or let us say by the wish which presses to be dealt with, since we have not learnt so far of any other psychical stimulus that disturbs sleep. Here the dream, too, is the result of a compromise. One sleeps, but one nevertheless experiences the removing of a wish; one satisfies a wish, but at the same time one continues to sleep. Both purposes are partly achieved and partly abandoned.

(8) You will recall that at one point we hoped to approach an understanding of the problems of dreams from the fact that certain imaginative structures which are very transparent to us are known as 'day-dreams'. Now these day-dreams are in fact wish-fulfilments, fulfilments of ambitions and erotic wishes which are well known to us; but they are *thought*, even though vividly imagined, and never experienced as hallucinations. Of the two chief characteristics of dreams, then, the less well assured is preserved here, while the other, since it depends on the state of sleep and cannot be realized in waking life, is entirely absent. Linguistic usage, therefore, has a suspicion of the fact that wish-fulfilment is a chief characteristic of dreams. Incidentally, if our experience in dreams is only a modified kind of imagining made possible by the conditions of the state of sleep - that is, a 'nocturnal day-dreaming' - we can already understand how the process of constructing a dream can dispose of the nocturnal stimulus and bring satisfaction, since day dreaming too is an activity bound up with satisfaction and is only practised, indeed, on that account.

But other usages of language express the same sense. There are familiar proverbs such as 'Pigs dream of acorns and geese dream of maize' or 'What do hens dream of? - Of millet.' So proverbs go even lower than we do - below children to animals - and assert that the content of dreams is the satisfaction of a need. Numbers of figures of speech seem to point in the same direction: 'lovely as a dream', 'I shouldn't have dreamt of such a thing', 'I haven't imagined it in my wildest dreams'. In this, linguistic usage is evidently taking sides. For there are anxiety dreams as well, and dreams with a distressing or indifferent content; but linguistic usage has been unmoved by them. It is true that it knows of 'bad dreams', but a dream pure and simple is only the sweet fulfilment of a wish. Nor is there any proverb which might tell us that pigs or geese dream of being slaughtered.

It is inconceivable, of course, that the wish-fulfilling characteristic of dreams should not have been noticed by writers on the subject. On the contrary, it has often been noticed; but it has not occurred to any of them to recognize this characteristic as a universal one and to make it into a corner-stone for the explanation of dreams. We can well imagine what it is that has held them back from it and we shall go into the matter later on.

But consider what a large amount of light has been thrown on things by our examination of children's dreams, and with scarcely any effort: the functions of dreams as the guardians of sleep; their origin from two concurrent purposes, one of which, the desire for sleep, remains constant, while the other strives to satisfy a psychical stimulus; proof that dreams are psychical acts with a sense; their two chief characteristics - wish-fulfilment and hallucinatory experience. And in discovering all this we were almost able to forget that we were engaged on psycho-analysis. Apart from its connection with parapraxes, our work has carried no specific mark. Any psychologist, knowing nothing of the postulates of psycho-analysis, might have been able to give this explanation of children's dreams. Why have they not done so?

If dreams of the infantile kind were the only ones, the problem would be solved and our task finished, and that without our questioning the dreamer or bringing in the unconscious or resorting to free association. This is evidently where a continuation of our task lies ahead. We have already found repeatedly that characteristics which were claimed as being of general validity have turned out to apply only to a particular sort and number of dreams. The question for us is therefore whether the general characteristics we inferred from children's dreams have a firmer footing, whether they also hold good of dreams which are not transparently clear and whose manifest content gives no sign of being connected with a wish left over from the previous day. It is our view that these other dreams have undergone a far-reaching distortion and for that reason cannot be judged at a first glance. We suspect too that to explain this distortion we shall need the psycho-analytic technique which we have been able to do without in the understanding we have just gained of children's dreams.

In any case, there is yet another class of dreams which are undistorted and, like children's dreams, can easily be recognized as wish-fulfilments. These are the dreams which all through life are called up by imperative bodily needs - hunger, thirst, sexual need - that is, they are wish-fulfilments as reactions to internal somatic stimuli. Thus I have a note of a dream dreamt by a little girl of nineteen months, which consisted of a *menu*, to which her own name was attached: '*Anna F., stawbewwies, wild stawbewwies, omblet, pudden!*' This was a reaction to a day without food, owing to a digestive upset, which had actually been traced back to the fruit which appeared twice in the dream. The little girl's grandmother - their combined ages came to seventy years - was simultaneously obliged to go without food for a whole day on account of a disturbance due to a floating kidney. She dreamt the same night that she had been 'asked out' and had been served with the most appetizing delicacies.

Observations on prisoners who have been compelled to starve, and on people who have been subjected to privations on travels and explorations, teach us that under these conditions the satisfaction of their needs is regularly dreamt of. Thus Otto Nordenskjöld (1904, 1, 336 f.) writes as follows of the members of his expedition while they were wintering in the Antarctic: 'The direction taken by our innermost thoughts was very clearly shown by our dreams, which were never more vivid or numerous than at this time. Even those of us who otherwise dreamt but rarely had long stories to tell in the morning when we exchanged our latest experiences in this world of the imagination. They were all concerned with the outside world which was now so remote from us, though they were often adapted to our actual circumstances. . . . Eating and drinking, however, were the pivot round which our dreams most often revolved. One of us, who had a special gift for attending large luncheon parties during the night, was proud if he was able to report in the morning that he had "got through a three-course dinner". Another of us dreamt of tobacco, of whole mountains of tobacco; while a third dreamt of a ship in full sail coming in across open water. Yet another dream is worth repeating. The postman brought round the mail and gave a long explanation of why we had had to wait so long for it: he had delivered it at the wrong address and had only succeeded in recovering it with great difficulty. We dreamt, of course, of still more impossible things. But there was a most striking lack of imaginativeness shown by almost all the dreams I dreamt myself or heard described. It would certainly be of great psychological interest if all these dreams could be recorded. And it will easily be understood how much we longed for sleep, since it could offer each one of us everything that he most eagerly desired.' So too, according to Du Prel, 'Mungo Park, when he was almost dying of thirst on one of his African journeys, dreamt unceasingly of the well-watered valleys and meadows of his home. Similarly, Baron Trenck, suffering torments of hunger while he was a prisoner in the fortress at Magdeburg, dreamt of being surrounded by sumptuous meals; and George Back, who took part in Franklin's first expedition, when he was almost dying of starvation as a result of his fearful privations, dreamt constantly and regularly of copious meals.'

Anyone who has eaten some highly-spiced dish at dinner and develops a thirst during the night is very likely to dream that he is drinking. It is of course impossible to get rid of a fairly strong need for food or drink by means of a dream. One wakes up from a dream of this sort still feeling thirsty, and has to have a drink of real water. The effect produced by the dream is in this instance trivial from the practical point of view; but it is none the less clear that it was produced with the aim of protecting one's sleep against a stimulus that was urging one to wake up and take action. When the need is of less intensity dreams of satisfaction often help one to get over it.

In the same way, dreams create satisfactions under the influence of sexual stimuli, but these show peculiarities which deserve mention. Since it is characteristic of the sexual instinct to be a degree less dependent on its object than hunger and thirst, the satisfaction in dreams of emission can be a real one; and in consequence of certain difficulties (which I shall have to mention later) in its relation to its object, it happens with special frequency that the real satisfaction is nevertheless attached to a dream-content which is obscure or distorted. This characteristic of dreams of emission (as Otto Rank has pointed out) makes them particularly favourable subjects for the study of dream-distortion. Furthermore, all adult dreams arising from bodily needs usually contain, in addition to the satisfaction, other material which is derived from purely psychical sources of stimulation and requires interpretation before it can be understood.

Moreover I do not mean to assert that the wish-fulfilment dreams of adults which are constructed on infantile lines only appear as reactions to the imperative needs that I have mentioned. We are acquainted as well with short, clear dreams of this sort which, under the influence of some dominant situation, arise out of what are unquestionably psychical sources of stimulation. There are, for instance, dreams of impatience: if someone has made preparations for a journey, for a theatrical performance that is important to him, for going to a lecture or paying a visit, he may dream of a premature fulfilment of his expectation; he may, during the night before the event, see himself arrived at his destination, present at the theatre, in conversation with the person he is going to visit. Or there are what are justly known as dreams of convenience, in which a person who would like to sleep longer dreams that he is already up and is washing, or is already at school, whereas he is really still sleeping and would rather get up in a dream than in reality. The wish to sleep, which we have recognized as regularly playing a part in the construction of dreams, comes into the open in these dreams and reveals itself in them as the essential dream-constructor. There is good reason for ranking the need to sleep alongside of the other great bodily needs.

Here is a reproduction of a picture by Schwind in the Schack Gallery in Munich, which shows how correctly the artist grasped the way in which dreams arise from the dominant situation. Its title is 'The Prisoner's Dream', a dream whose content is bound to be his escape. It is a happy point that he is to escape through the window, for it is the stimulus of the light pouring in by the window that is putting an end to the prisoner's sleep. The gnomes who are clambering up on one another no doubt represent the successive positions which he himself would have had to take as he climbed up to the level of the window; and, if I am not mistaken and am not attributing too much deliberation to the artist, the topmost of the gnomes, who is sawing through the bars - that is, who is doing what the prisoner would like to do - has the same features as himself.

THE PRISONERS DREAM

In all dreams other than children's dreams and those of an infantile type our path is, as I have said, obstructed by dream distortion. We cannot tell, to begin with, whether these other dreams too are wish-fulfilments as we suspect, we cannot guess from their manifest content to what psychical stimulus they owe their origin, and we cannot prove that they too are endeavouring to get rid of that stimulus or in some way deal with it. They must be interpreted - that is, translated -, their distortion must be undone, and their manifest content replaced by their latent one, before we can form a judgement as to whether what we have found in infantile dreams can claim to be valid for all dreams.

LECTURE IX

THE CENSORSHIP OF DREAMS

LADIES AND GENTLEMEN, - The study of the dreams of children has taught us the origin, the essential nature and the function of dreams. *Dreams are things which get rid of (psychical) stimuli disturbing to sleep, by the method of hallucinatory satisfaction.* We have, however, only been able to explain one group of the dreams of adults - those which we have described as dreams of an infantile type. What the facts are about the others we cannot yet say, but we do not understand them. We have arrived at a provisional finding, however, whose importance we must not under-estimate. Whenever a dream has been completely intelligible to us, it has turned out to be the hallucinated fulfilment of a wish. This coincidence cannot be a chance one nor a matter of indifference.

We have assumed of dreams of another sort, on the basis of various considerations and on the analogy of our views on parapraxes, that they are a distorted substitute for an unknown content, and that the first thing is to trace them back to it. Our immediate task, then, is an enquiry which will lead to an understanding of this *distortion in dreams*.

Dream-distortion is what makes a dream seem strange and unintelligible to us. We want to know a number of things about it: firstly, where it comes from - its dynamics -, secondly, what it does and, lastly, how it does it. We can also say that dream distortion is carried out by the dream-work; and we want to describe the dream-work and trace it back to the forces operating in it.

And now listen to this dream. It was recorded by a lady belonging to our group,¹ and, as she tells us, was derived from a highly-esteemed and cultivated elderly lady. No analysis was made of the dream; our informant remarks that for a psycho-analyst it needs no interpreting. Nor did the dreamer herself interpret it, but she judged it and condemned it as though she understood how to interpret it; for she said of it: 'And disgusting, stupid stuff like this was dreamt by a woman of fifty, who has no other thoughts day and night but worry about her child!'

¹ Frau Dr. von Hug-Hellmuth.

Here, then, is the dream - which deals with 'love services' in war-time.¹ *'She went to Garrison Hospital No. 1 and informed the sentry at the gate that she must speak to the Chief Medical Officer (mentioning a name that was unknown to her) as she wanted to volunteer for service at the hospital. She pronounced the word "service" in such a way that the N.C.O. at once understood that she meant "love service". Since she was an elderly lady, after some hesitation he allowed her to pass. Instead of finding the Chief Medical Officer, however, she reached a large and gloomy apartment in which a number of officers and army doctors were standing and sitting round a long table. She approached a staff surgeon with her request, and he understood her meaning after she had said only a few words. The actual wording of her speech in the dream was: "I and many other women and girls in Vienna are ready to . . ." at this point in the dream her words turned into a mumble ". . . for the troops - officers and other ranks without distinction." She could tell from the expressions on the officers' faces, partly embarrassed and partly sly, that everyone had understood her meaning correctly. The lady went on: "I'm aware that our decision must sound surprising, but we mean it in bitter earnest. No one asks a soldier in the field whether he wishes to die or not." There followed an awkward silence of some minutes. The staff surgeon then put his arm round her waist and said "Suppose, madam, it actually came to . . . (mumble)." She drew away from him, thinking to herself: "He's like all the rest of them", and replied: "Good gracious, I'm an old woman and I might never come to that. Besides, there's one condition that must be observed: age must be respected. It must never happen that an elderly woman . . . (mumble) . . . a mere boy. That would be terrible." "I understand perfectly," replied the staff surgeon. Some of the officers, and among them one who had been a suitor of hers in her youth, laughed out loud. The lady then asked to be taken to the Chief Medical Officer, with whom she was acquainted, so that the whole matter could be thrashed out; but she found, to her consternation, that she could not recall his name. Nevertheless, the staff surgeon, most politely and respectfully, showed her the way up to the second floor by a very narrow, iron, spiral staircase, which led directly from the room to the upper storeys of the building. As she went up she heard an officer say: "That's a tremendous decision to make - no matter whether a woman's young or old! Splendid of her!" Feeling simply that she was doing her duty, she walked up an interminable staircase.*

'The dream was repeated twice in the course of a few weeks, with, as the lady remarked, some quite unimportant and meaningless modifications.'

¹ [*'Liebesdienste'* means in the first instance 'services performed for love', i.e. 'unremunerated services'; but it could bear another, less respectable, meaning.]

From its continuous nature, the dream resembles a daytime phantasy: there are few breaks in it, and some of the details of its content could have been explained if they had been enquired into, but that, as you know, was not done. But what is remarkable and interesting from our point of view is that the dream shows several gaps - gaps not in the dreamer's memory of the dream but in the content of the dream itself. At three points the content was, as it were, extinguished; the speeches in which these gaps occurred were interrupted by a mumble. As no analysis was carried out, we have, strictly speaking, no right to say anything about the sense of the dream. Nevertheless there are hints on which conclusions can be based (for instance, in the phrase 'love services'); but above all, the portions of the speeches immediately preceding the mumbles call for the gaps to be filled in, and in an unambiguous manner. If we make the insertions, the content of the phantasy turns out to be that the dreamer is prepared, by way of fulfilling a patriotic duty, to put herself at the disposal of the troops, both officers and other ranks, for the satisfaction of their erotic needs. This is, of course, highly objectionable, the model of a shameless libidinal phantasy - but it does not appear in the dream at all. Precisely at the points at which the context would call for this admission, the manifest dream contains an indistinct mumble: something has been lost or suppressed.

You will, I hope, think it plausible to suppose that it was precisely the objectionable nature of these passages that was the motive for their suppression. Where shall we find a parallel to such an event? You need not look far in these days. Take up any political newspaper and you will find that here and there the, text is absent and in its place nothing except the white paper is to be seen. This, as you know, is the work of the press censorship. In these empty places there was something that displeased the higher censorship authorities and for that reason it was removed - a pity, you feel, since no doubt it was the most interesting thing in the paper - the 'best bit'.

On other occasions the censorship has not gone to work on a passage *after* it has already been completed. The author has seen in advance which passages might expect to give rise to objections from the censorship and has on that account toned them down in advance, modified them slightly, or has contented himself with approximations and allusions to what would genuinely have come from his pen. In that case there are no blank places in the paper, but circumlocutions and obscurities of expression appearing at certain points will enable you to guess where regard has been paid to the censorship in advance.

Well, we can keep close to this parallel. It is our view that the omitted pieces of the speeches in the dream which were concealed by a mumble have likewise been sacrificed to a censorship. We speak in so many words of a '*dream-censorship*', to which some share in dream-distortion is to be attributed. Wherever there are gaps in the manifest dream the dream-censorship is responsible for them. We should go further, and regard it as a manifestation of the censorship wherever a dream-element is remembered especially faintly, indefinitely and doubtfully among other elements that are more clearly constructed. But it is only rarely that this censorship manifests itself so undisguisedly - so naïvely, one might say - as in this example of the dream of 'love services'. The censorship takes effect much more frequently according to the second method, by producing softenings, approximations and allusions instead of the genuine thing.

I know of no parallel in the operations of the press-censorship to a third manner of working by the dream-censorship; but I am able to demonstrate it from precisely the one example of a dream which we have analysed so far. You will recall the dream of the 'three bad theatre-tickets for 1 florin 50'. In the latent thoughts of that dream the element 'over-hurriedly, too early' stood in the foreground. Thus: it was absurd to marry so *early* - it was also absurd to take the theatre-tickets so *early* - it was ridiculous of the sister-in-law to part with her money in such a *hurry* to buy jewellery with it. Nothing of this central element of the dream-thoughts passed over into the manifest dream; in it the central position is taken by the 'going to the theatre' and 'taking the tickets'. As a result of this displacement of accent, this fresh grouping of the elements of the content, the manifest dream has become so unlike the latent dream-thoughts that no-one would suspect the presence of the latter behind the former. This displacement of accent is one of the chief instruments of dream-distortion and it is what gives the dream the strangeness on account of which the dreamer himself is not inclined to recognize it as his own production.

Omission, modification, fresh grouping of the material - these, then, are the activities of the dream-censorship and the instruments of dream-distortion. The dream-censorship itself is the originator, or one of the originators, of the dream-distortion which we are now engaged in examining. We are in the habit of combining the concepts of modification and re-arrangement under the term 'displacement'.

After these remarks on the activities of the dream-censorship, we will now turn to its dynamics. I hope you do not take the term too anthropomorphically, and do not picture the 'censor of dreams' as a severe little manikin or a spirit living in a closet in the brain and there discharging his office; but I hope too that you do not take the term in too 'localizing' a sense, and do not think of a 'brain-centre', from which a censoring influence of this kind issues, an influence which would be brought to an end if the 'centre' were damaged or removed. For the time being it is nothing more than a serviceable term for describing a dynamic relation. The word does not prevent our asking by what purposes this influence is exercised and against what purposes it is directed. And we shall not be surprised to learn that we have come up against the dream-censorship once already, though perhaps without recognizing it.

For that is in fact the case. You will recall that when we began to make use of our technique of free association we made a surprising discovery. We became aware that our efforts at proceeding from the dream-element to the unconscious element for which it is a substitute were being met by a *resistance*. This resistance, we said, could be of different magnitudes, sometimes enormous and sometimes quite insignificant. In the latter case we need to pass through only a small number of intermediate links in our work of interpretation; but when the resistance is large we have to traverse long chains of associations from the dream-element, we are led far away from it and on our path we have to overcome all the difficulties which represent themselves as critical objections to the ideas that occur. What we met with as resistance in our work of interpretation must now be introduced into the dream-work in the form of the dream-censorship. The resistance to interpretation is only a putting into effect of the dream-censorship. It also proves to us that the force of the censorship is not exhausted in bringing about the distortion of dreams and thereafter extinguished, but that the censorship persists as a permanent institution which has as its aim the maintenance of the distortion. Moreover, just as the strength of the resistance varies in the interpretation of each element in a dream, so too the magnitude of the distortion introduced by the censorship varies for each element in the same dream. If we compare the manifest and the latent dream, we shall find that some particular latent elements have been completely eliminated, others modified to a greater or less extent, while yet others have been carried over into the manifest content of the dream unaltered or even perhaps strengthened.

But we wanted to enquire what are the purposes which exercise the censorship and against what purposes it is directed. Now this question, which is fundamental for the understanding of dreams and perhaps, indeed, of human life, is easy to answer if we look through the series of dreams which have been interpreted. The purposes which exercise the censorship are those which are acknowledged by the dreamer's waking judgement, those with which he feels himself at one. You may be sure that if you reject an interpretation of one of your own dreams which has been correctly carried out, you are doing so for the same motives for which the dream-censorship has been exercised, the dream-distortion brought about and the interpretation made necessary. Take the dream of our fifty-year-old lady. She thought her dream disgusting without having analysed it, and she would have been still more indignant if Dr. von Hug-Hellmuth had told her anything of its inevitable interpretation; it was precisely because of this condemnation by the dreamer that the objectionable passages in her dream were replaced by a mumble.

The purposes *against* which the dream-censorship is directed must be described in the first instance from the point of view of that agency itself. If so, one can only say that they are invariably of a reprehensible nature, repulsive from the ethical, aesthetic and social point of view - matters of which one does not venture to think at all or thinks only with disgust. These wishes, which are censored and given a distorted expression in dreams, are first and foremost manifestations of an unbridled and ruthless egoism. And, to be sure, the dreamer's own ego appears in every dream and plays the chief part in it, even if it knows quite well how to hide itself so far as the manifest content goes. This '*sacro egoisimo*' of dreams is certainly not unrelated to the attitude we adopt when we sleep, which consists in our withdrawing our interest from the whole external world.

The ego, freed from all ethical bonds, also finds itself at one with all the demands of sexual desire, even those which have long been condemned by our aesthetic upbringing and those which contradict all the requirements of moral restraint. The desire for pleasure - the 'libido', as we call it - chooses its objects without inhibition, and by preference, indeed, the forbidden ones: not only other men's wives, but above all incestuous objects, objects sanctified by the common agreement of mankind, a man's mother and sister, a woman's father and brother. (The dream of our fifty-year-old lady, too, was incestuous; her libido was unmistakably directed to her son.) Lusts which we think of as remote from human nature show themselves strong enough to provoke dreams. Hatred, too, rages without restraint. Wishes for revenge and death directed against those who are nearest and dearest in waking life, against the dreamer's parents, brothers and sisters, husband or wife, and his own children are nothing unusual. These censored wishes appear to rise up out of a positive Hell; after they have been interpreted when we are awake, no censorship of them seems to us too severe.

But you must not blame the dream itself on account of its evil content. Do not forget that it performs the innocent and indeed useful function of preserving sleep from disturbance. This wickedness is not part of the essential nature of dreams. Indeed you know too that there are dreams which can be recognized as the satisfaction of justified wishes and of pressing bodily needs. These, it is true, have no dream-distortion; but they have no need of it, for they can fulfil their function without insulting the ethical and aesthetic purposes of the ego. Bear in mind, too, that dream-distortion is proportionate to two factors. On the one hand it becomes greater the worse the wish that has to be censored; but on the other hand it also becomes greater the more severe the demands of the censorship at the moment. Thus a strictly brought-up and prudish young girl, with a relentless censorship, will distort dream-impulses which we doctors, for instance, would have to regard as permissible, harmless, libidinal wishes, and on which in ten years' time the dreamer herself will make the same judgement.

Furthermore, we have not got nearly far enough yet to be able to feel indignant at this result of our work of interpretation. We do not yet, I think, understand it properly; but our first duty is to defend it against certain aspersions. There is no difficulty in finding a weak point in it. Our dream-interpretations are made on the basis of the premisses which we have already accepted - that dreams in general have a sense, that it is legitimate to carry across from hypnotic to normal sleep the fact of the existence of mental processes which are at the time unconscious, and that everything that occurs to the mind is determined. If on the basis of these premisses we had arrived at plausible findings from dream-interpretation, we should have been justified in concluding that the premisses were valid. But how about it if these findings seem to be as I have pictured them? We should then be tempted to say: 'These are impossible, senseless or at the least most improbable findings; so there was something wrong about the premisses. Either dreams are not psychical phenomena, or there is nothing unconscious in the normal state, or our technique has a flaw in it. Is it not simpler and more satisfactory to suppose this rather than accept all the abominations which we are supposed to have discovered on the basis of our premisses?'

Yes, indeed! Both simpler and more satisfactory - but not necessarily on that account more correct. Let us give ourselves time: the matter is not yet ripe for judgement. And first we can further strengthen the criticism of our dream-interpretations. The fact that the findings from them are so disagreeable and repellent need not, perhaps, carry very great weight. A stronger argument is that the dreamers to whom we are led to attribute such wishful purposes by the interpretation of their dreams reject them most emphatically and for good reasons. 'What?' says one of them, 'you want to convince me from this dream that I regret the money I have spent on my sister's dowry and my brother's education? But that cannot be so. I work entirely for my brothers and sisters; I have no other interest in life but to fulfil my duties to them, which, as the eldest of the family, I promised our departed mother I would do.' Or a woman dreamer would say: 'You think I wish my husband was dead? That is a shocking piece of nonsense! It is not only that we are most happily married - you would probably not believe me if I said that - but his death would rob me of everything I possess in the world.' Or another man would answer us: 'You say that I have sensual desires for my sister? That is ridiculous! She means nothing at all to me. We are on bad terms with each other and I have not exchanged a word with her for years.' We might still take it lightly, perhaps, if these dreamers neither confirmed nor denied the purposes we attribute to them; we might say that these were just things they did not know about themselves. But when they feel in themselves the precise contrary of the wish we have interpreted to them and when they are able to prove to us by the lives they lead that they are dominated by this contrary wish, it must surely take us aback. Has not the time come to throw aside the whole work we have done on dream-interpretation as something which its findings have reduced *ad absurdum*?

No, not even now. Even this stronger argument collapses if we examine it critically. Granted that there are unconscious purposes in mental life, nothing is proved by showing that purposes opposed to these are dominant in conscious life. Perhaps there is room in the mind for contrary purposes, for contradictions, to exist side by side. Possibly, indeed, the dominance of one impulse is precisely a necessary condition of its contrary being unconscious. We are after all left, then, with the first objections that were raised: the findings of dream-interpretation are not simple and they are very disagreeable. We may reply to the first that all your passion for what is simple will not be able to solve a single one of the problems of dreams. You must get accustomed here to assuming a complicated state of affairs. And we may reply to the second that you are plainly wrong to use a liking or disliking that you may feel as the ground for a scientific judgement. What difference does it make if the findings of dream-interpretation seem disagreeable to you or, indeed, embarrassing and repulsive. '*Ça n'empêche pas d'exister*'¹, as I heard my teacher Charcot say in a similar case when I was a young doctor. One must be humble and hold back one's sympathies and antipathies if one wants to discover what is real in this world. If a physicist were able to prove to you that in a short period organic life on this earth would be brought to an end by freezing, would you venture to make the same reply to him: 'That cannot be so, the prospect is too disagreeable'? You would, I think, be silent, until another physicist came and pointed out to the first one an error in his premisses or calculations. When you reject something that is disagreeable to you, what you are doing is *repeating* the mechanism of constructing dreams rather than understanding it and surmounting it.

¹ ['It doesn't prevent things from existing.']

You will promise now, perhaps, to disregard the repellent character of the censored dream-wishes and will withdraw upon the argument that after all it is unlikely that such a large space should be given to the evil in the constitution of human beings. But do your own experiences justify your saying this? I will not discuss how you may appear to yourselves; but have you found so much benevolence among your superiors and competitors, so much chivalry among your enemies and so little envy in your social surroundings that you feel it your duty to protest against egoistic evil having a share in human nature? Are you not aware of how uncontrolled and untrustworthy the average person is in everything to do with sexual life? Or do you not know that all the transgressions and excesses of which we dream at night are daily committed in real life by waking men? what does psycho-analysis do here but confirm Plato's old saying that the good are those who are content to dream of what the others, the bad, really do?

And now turn your eyes away from individuals and consider the Great War which is still laying Europe waste. Think of the vast amount of brutality, cruelty and lies which are able to spread over the civilized world. Do you really believe that a handful of ambitious and deluding men without conscience could have succeeded in unleashing all these evil spirits if their millions of followers did not share their guilt? Do you venture, in such circumstances, to break a lance on behalf of the exclusion of evil from the mental constitution of mankind?

You will represent to me that I am giving a one-sided judgement on the War: that it has also brought to light what is finest and noblest in men, their heroism, their self-sacrifice, their social sense. No doubt; but are you not now showing yourselves as accessories to the injustice that has so often been done to psycho-analysis in reproaching it with denying one thing because it has asserted another? It is not our intention to dispute the noble endeavours of human nature, nor have we ever done anything to detract from their value. On the contrary; I am exhibiting to you not only the evil dream-wishes which are censored but also the censorship, which suppresses them and makes them unrecognizable. We lay a stronger emphasis on what is evil in men only because other people disavow it and thereby make the human mind, not better, but incomprehensible. If now we give up this one-sided ethical valuation, we shall undoubtedly find a more correct formula for the relation between good and evil in human nature.

There it is, then. We need not give up the findings of our work on the interpretation of dreams even though we cannot but regard them as strange. Perhaps we shall be able to approach an understanding of them later from another direction. For the time being let us hold fast to this: dream-distortion is a result of the censorship which is exercised by recognized purposes of the ego against wishful impulses in any way objectionable that stir within us at night-time during our sleep. Why this should happen particularly at night-time and where these reprehensible wishes come from - these are matters on which, no doubt, much still remains for questioning and research.

But it would be unfair if we neglected at this point to emphasize sufficiently another outcome of our investigations. The dream-wishes which seek to disturb us in our sleep are unknown to us and indeed we only learnt of them through dream-interpretation. They are thus to be described, in the sense we have discussed, as unconscious for the time being. But we must reflect that they are unconscious too for more than the time being. The dreamer also disavows them, as we have seen in so many instances, after he has come to know them through the interpretation of his dream. We are then faced once again with the position we first came across in the 'hiccoughing' slip of the tongue, where the proposer of the toast protested indignantly that neither then nor at any earlier time had he become conscious of any disrespectful impulse towards his Chief. Already at the time we felt some doubts about the weight of an assurance of this kind, and suggested instead the hypothesis that the speaker was permanently unaware of the presence of this impulse in him. This situation is repeated now with every interpretation of a strongly distorted dream and consequently gains an increased importance in its bearing on the view we have taken. We are now prepared to assume that there are in the mind processes and purposes of which one knows nothing at all has known nothing for a long time, and has even perhaps never known anything. With this the unconscious acquires a new sense for us; the characteristic of 'for the time being' or 'temporary' disappears from its essential nature. It can mean *permanently* unconscious and not merely 'latent at the time'. We shall of course have to hear more about this on some other occasion.

LECTURE X

SYMBOLISM IN DREAMS

LADIES AND GENTLEMEN, - We have found that the distortion in dreams, which interferes with our understanding of them, is the result of a censoring activity which is directed against unacceptable, unconscious wishful impulses. We have not, of course, maintained that the censorship is the sole factor responsible for the distortion in dreams, and in fact when we study them further we can discover that other factors play a part in producing this result. This amounts to our saying that even if the dream-censorship was out of action we should still not be in a position to understand dreams, the manifest dream would still not be identical with the latent dream-thoughts.

We come upon this other factor which prevents dreams from being lucid, this new contribution to dream-distortion, by noticing a gap in our technique. I have already admitted to you that it does sometimes really happen that nothing occurs to a person under analysis in response to particular elements of his dreams. It is true that this does not happen as often as he asserts; in a great many cases, with perseverance, an idea is extracted from him. But nevertheless there remain cases in which an association fails to emerge or, if it *is* extracted, does not give us what we expected from it. If this happens during a psycho-analytic treatment, it has a peculiar significance with which we are not here concerned. But it also happens in the interpretation of normal people's dreams or in that of our own. If we convince ourselves that in such case no amount of pressure is of any use, we eventually discover that this unwished-for event regularly occurs in connection with particular dream-elements, and we begin to recognize that a fresh general principle is at work where we had begun by thinking we were only faced by an exceptional failure of technique.

In this way we are tempted to interpret these 'mute' dream-elements ourselves, to set about translating them with our own resources. We are then forced to recognize that whenever we venture on making a replacement of this sort we arrive at a satisfactory sense for the dream, whereas it remains senseless and the chain of thought is interrupted so long as we refrain from intervening in this way. An accumulation of many similar cases eventually gives the necessary certainty to what began as a timid experiment.

I am putting all this in a rather schematic way; but that is permissible, after all, for didactic purposes, nor has it been falsified, but merely simplified.

In this way we obtain constant translations for a number of dream-elements - just as popular 'dream-books' provide them for *everything* that appears in dreams. You will not have forgotten, of course, that when we use our *associative* technique constant replacements of dream-elements never come to light.

You will object at once that this method of interpretation strikes you as far more insecure and open to attack than the earlier one by means of free association. There is, however, something further. For when, with experience, we have collected enough of these constant renderings, the time comes when we realize that we should in fact have been able to deal with these portions of dream-interpretation from our own knowledge, and that they could really be understood without the dreamer's associations. How it is that we must necessarily have known their meaning will become clear in the second half of our present discussion.

A constant relation of this kind between a dream-element and its translation is described by us as a 'symbolic' one, and the dream-element itself as a 'symbol' of the unconscious dream-thought. You will recall that earlier, when we were investigating the relations between dream-elements and the 'genuine' thing behind them, I distinguished three such relations - those of a part to a whole, of allusion and of plastic portrayal. I warned you at the time that there was a fourth, but I did not name it. This fourth relation is the symbolic one which I am now introducing. It gives occasion for some most interesting discussions, and I will turn to them before laying before you the detailed results of our observations of symbolism.

Symbolism is perhaps the most remarkable chapter of the theory of dreams. In the first place, since symbols are stable translations, they realize to some extent the ideal of the ancient as well as of the popular interpretation of dreams, from which, with our technique, we had departed widely. They allow us in certain circumstances to interpret a dream without questioning the dreamer, who indeed would in any case have nothing to tell, us about the symbol. If we are acquainted with the ordinary dream-symbols, and in addition with the dreamer's personality, the circumstances in which he lives and the impressions which preceded the occurrence of the dream, we are often in a position to interpret a dream straightaway - to translate it at sight, as it were. A piece of virtuosity of this kind flatters the dream-interpreter and impresses the dreamer; it forms an agreeable contrast to the laborious work of questioning the dreamer. But do not allow yourselves to be led astray by this. It is not our business to perform acts of virtuosity. Interpretation based on a knowledge of symbols is not a technique which can replace or compete with the associative one. It forms a supplement to the latter and yields results which are only of use when introduced into it. And as regards acquaintance with the dreamer's psychical situation, you must bear in mind that the dreams of people you know well are not the only ones you have to analyse, that you are not as a rule familiar with the events of the previous day, which were the instigators of the dream, but that the associations of the person you are analysing will provide you precisely with a knowledge of what we call the psychical situation.

Moreover it is quite specially remarkable - having regard, too, to some considerations which we shall mention later - that the most violent resistances have been expressed once again to the existence of a symbolic relation between dreams and the unconscious. Even people of judgement and reputation, who, apart from this, have gone a long way in agreeing with psycho-analysis, have at this point withheld their support. This behaviour is all the stranger in view, first, of the fact that symbolism is not peculiar to dreams alone and is not characteristic of them, and, secondly, that symbolism in dreams is by no means a discovery of psycho-analysis, however many other surprising discoveries it has made. The philosopher K. A. Scherner (1861) must be described as the discoverer of dream-symbolism, if its beginning is to be placed in modern times at all. Psycho-analysis has confirmed Scherner's findings, though it has made material modifications in them.

You will now want to hear something of the nature of dream symbolism and to be given some examples of it. I will gladly tell you what I know, though I must confess that our understanding of it does not go as far as we should like.

The essence of this symbolic relation is that it is a comparison, though not a comparison of *any* sort. Special limitations seem to be attached to the comparison, but it is hard to say what these are. Not everything with which we can compare an object or a process appears in dreams as a symbol for it. And on the other hand a dream does not symbolize every possible element of the latent dream-thoughts but only certain definite ones. So there are restrictions here in both directions. We must admit, too, that the concept of a symbol cannot at present be sharply delimited: it shades off into such notions as those of a replacement or representation, and even approaches that of an allusion. With a number of symbols the comparison which underlies them is obvious. But again there are other symbols in regard to which we must ask ourselves where we are to look for the common element, the *tertium comparationis*, of the supposed comparison. On further reflection we may afterwards discover it or it may definitely remain concealed. It is strange, moreover, that if a symbol is a comparison it should not be brought to light by an association, and that the dreamer should not be acquainted with it but should make use of it without knowing about it: more than that, indeed, that the dreamer feels no inclination to acknowledge the comparison even after it has been pointed out to him. You see, then, that a symbolic relation is a comparison of a quite special kind, of which we do not as yet clearly grasp the basis, though perhaps we may later arrive at some indication of it.

The range of things which are given symbolic representation in dreams is not wide: the human body as a whole, parents, children, brothers and sisters, birth, death, nakedness - and something else besides. The one typical - that is regular - representation of the human figure as a whole is a *house*, as was recognized by Scherner, who even wanted to give this symbol a transcendent importance which it does not possess. It may happen in a dream that one finds oneself climbing down the façade of a house, enjoying it at one moment, frightened at another. The houses with smooth walls are men, the ones with projections and balconies that one can hold on to are women. One's parents appear in dreams as the *Emperor* and *Empress*, the *King* and *Queen* or other honoured personages; so here dreams are displaying much filial piety. They treat children and brothers and sisters less tenderly: these are symbolized as *small animals* or *vermin*. Birth is almost invariably represented by something which has a connection with *water*: one either falls into the water or climbs out of it, one rescues someone from the water or is rescued by someone - that is to say, the relation is one of mother to child. Dying is replaced in dreams by *departure*, by a *train journey*, being dead by various obscure and, as it were, timid hints, nakedness by *clothes* and *uniforms*. You see how indistinct the boundaries are here between symbolic and allusive representation.

It is a striking fact that, compared with this scanty enumeration, there is another field in which the objects and topics are represented with an extraordinarily rich symbolism. This field is that of sexual life - the genitals, sexual processes, sexual intercourse. The very great majority of symbols in dreams are sexual symbols. And here a strange disproportion is revealed. The topics I have mentioned are few, but the symbols for them are extremely numerous, so that each of these things can be expressed by numbers of almost equivalent symbols. The outcome, when they are interpreted, gives rise to general objection. For, in contrast to the multiplicity of the representations in the dream, the interpretations of the symbols are very monotonous, and this displeases everyone who hears of it; but what is there that we can do about it?

Since this is the first time I have spoken of the subject-matter of sexual life in one of these lectures, I owe you some account of the way in which I propose to treat the topic. Psycho-analysis finds no occasion for concealments and hints, it does not think it necessary to be ashamed of dealing with this important material, it believes it is right and proper to call everything by its correct name, and it hopes that this will be the best way of keeping irrelevant thoughts of a disturbing kind at a distance. The fact that these lectures are being given before a mixed audience of both sexes can make no difference to this. Just as there can be no science *in usum Delphini*, there can be none for schoolgirls; and the ladies among you have made it clear by their presence in this lecture-room that they wish to be treated on an equality with men.

The male genitals, then, are represented in dreams in a number of ways that must be called symbolic, where the common element in the comparison is mostly very obvious. To begin with, for the male genitals as a whole the sacred number 3 is of symbolic significance. The more striking and for both sexes the more interesting component of the genitals, the male organ, finds symbolic substitutes in the first instance in things that resemble it in shape - things, accordingly, that are long and up-standing, such as *sticks, umbrellas, posts, trees* and so on; further, in objects which share with the thing they represent the characteristic of penetrating into the body and injuring - thus, sharp *weapons* of every kind, *knives, daggers, spears, sabres*, but also fire-arms, *rifles, pistols* and *revolvers* (particularly suitable owing to their shape). In the anxiety dreams of girls, being followed by a man with a knife or a fire-arm plays a large part. This is perhaps the commonest instance of dream symbolism and you will now be able to translate it easily. Nor is there any difficulty in understanding how it is that the male organ can be replaced by objects from which water flows - *water-taps, watering-cans, or fountains* - or again by other objects which are capable of being lengthened, such as *hanging-lamps, extensible pencils*, etc. A no less obvious aspect of the organ explains the fact that *pencils, pen-holders, nail-files, hammers*, and other *instruments* are undoubted male sexual symbols.

The remarkable characteristic of the male organ which enables it to rise up in defiance of the laws of gravity, one of the phenomena of erection, leads to its being represented symbolically by *balloons*, *flying-machines* and most recently by *Zeppelin airships*. But dreams can symbolize erection in yet another, far more expressive manner. They can treat the sexual organ as the essence of the dreamer's whole person and make him himself *fly*. Do not take it to heart if dreams of flying, so familiar and often so delightful, have to be interpreted as dreams of general sexual excitement, as erection-dreams. Among students of psycho-analysis, Paul Federn has placed this interpretation beyond any doubt; but the same conclusion was reached from his investigations by Mourly Vold, who has been so much praised for his sobriety, who carried out the dream-experiments I have referred to with artificially arranged positions of the arms and legs and who was far removed from psycho-analysis and may have known nothing about it. And do not make an objection out of the fact that women can have the same flying dreams as men. Remember, rather, that our dreams aim at being the fulfilments of wishes and that the wish to be a man is found so frequently, consciously or unconsciously, in women. Nor will anyone with a knowledge of anatomy be bewildered by the fact that it is possible for women to realize this wish through the same sensations as men. Women possess as part of their genitals a small organ similar to the male one; and this small organ, the clitoris, actually plays the same part in childhood and during the years before sexual intercourse as the large organ in men.

Among the less easily understandable male sexual symbols are certain *reptiles* and *fishes*, and above all the famous symbol of the *snake*. It is certainly not easy to guess why *hats* and *overcoats* or *cloaks* are employed in the same way, but their symbolic significance is quite unquestionable. And finally we can ask ourselves whether the replacement of the male limb by another limb, the foot or the hand, should be described as symbolic. We are, I think, compelled to do so by the context and by counterparts in the case of women.

The female genitals are symbolically represented by all such objects as share their characteristic of enclosing a hollow space which can take something into itself: by *pits*, *cavities* and *hollows*, for instance, by *vessels* and *bottles*, by *receptacles*, *boxes*, *trunks*, *cases*, *chests*, *pockets*, and so on. *Ships*, too, fall into this category. Some symbols have more connection with the uterus than with the female genitals: thus, *cupboard*, *stoves* and, more especially, *rooms*. Here room-symbolism touches on house-symbolism. *Doors* and *gates*, again, are symbols of the genital orifice. Materials, too, are symbols for women: *wood*, *papery* and objects made of them, like *tables* and *books*. Among animals, *snails* and *mussels* at least are undeniably female symbols; among parts of the body, the *mouth* (as a substitute for the genital orifice); among buildings, *churches* and *chapels*. Not every symbol, as you will observe, is equally intelligible.

The breasts must be reckoned with the genitals, and these, like the larger hemispheres of the female body, are represented by *apples*, *peaches*, and *fruit* in general. The pubic hair of both sexes is depicted in dreams as *woods* and *bushes*. The complicated topography of the female genital parts makes one understand how it is that they are often represented as *landscapes*, with rocks, woods and water, while the imposing mechanism of the male sexual apparatus explains why all kinds of complicated machinery which is hard to describe serve as symbols for it.

Another symbol of the female genitals which deserves mention is a *jewel-case*. *Jewel* and *treasure* are used in dreams as well as in waking life to describe someone who is loved. *Sweets* frequently represent sexual enjoyment. Satisfaction obtained from a person's own genitals is indicated by all kinds of *playing*, including *piano-playing*. Symbolic representations *par excellence* of masturbation are *gliding* or *sliding* and *pulling off a branch*. (The *falling out of a tooth* or the *pulling out of a tooth* is a particularly notable dream-symbol. Its first meaning is undoubtedly castration as a punishment for masturbating. We come across special representations of sexual intercourse less often than might be expected from what has been said so far. Rhythmical activities such as *dancing*, *riding* and *climbing* must be mentioned here, as well as violent experiences such as *being run over*; so, too, certain *manual crafts*, and, of course, *threatening with weapons*.

You must not picture the use or the translation of these symbols as something quite simple. In the course of them all kinds of things happen which are contrary to our expectations. It seems almost incredible, for instance, that in these symbolic representations the differences between the sexes are often not clearly observed. Some symbols signify genitals in general, irrespective of whether they are male or female: for instance, a *small* child, a *small* son or a *small* daughter. Or again, a predominantly male symbol may be used for the female genitals or vice versa. We cannot understand this till we have obtained some insight into the development of sexual ideas in human beings. In some instances the ambiguity of the symbols may only be an apparent one; and the most marked symbols, such as *weapons*, *pockets* and *chest*s are excluded from this bisexual use.

I will now go on to make a survey, starting not from the thing represented but from the symbol, of the fields from which sexual symbols are mostly derived, and I will make a few additional remarks, with special reference to the symbols where the common element in the comparison is not understood. The *hat* is an obscure symbol of this kind - perhaps, too, head-coverings in general - with a male significance as a rule, but also capable of a female one. In the same way an *overcoat* or *cloak* means a man, perhaps not always with a genital reference; it is open to you to ask why. Neckties, which hang down and are not worn by women, are a definitely male symbol. *Underclothing* and *linen* in general are female. *Clothes* and *uniforms*, as we have already seen, are a substitute for nakedness or bodily shapes. *Shoes* and *slippers* are female genitals. *Tables* and *wood* have already been mentioned as puzzling but certainly female symbols. *Ladders*, *steps*, and *staircases*, or, more precisely, walking on them, are clear symbols of sexual intercourse. On reflection, it will occur to us that the common element here is the rhythm of walking up them - perhaps, too, the increasing excitement and breathlessness the higher one climbs.

We have earlier referred to *landscapes* as representing the female genitals. *Hills* and *rocks* are symbols of the male organ. *Gardens* are common symbols of the female genitals. *Fruit* stands, not for children, but for the breasts. *Wild animals* mean people in an excited sensual state, and further, evil instincts or passions. *Blossoms* and *flowers* indicate women's genitals, or, in particular, virginity. Do not forget that blossoms are actually the genitals of plants.

We are acquainted already with *rooms* as a symbol. The representation can be carried further, for windows, and doors in and out of rooms, take over the meaning of orifices in the body. And the question of the room being *open* or *locked* fits in with this symbolism, and the *key* that opens it is a decidedly male symbol.

Here, then, is material used for symbolism in dreams. It is not complete and could be carried deeper as well as further. But I fancy it will seem to you more than enough and may even have exasperated you. 'Do I really live in the thick of sexual symbols?' you may ask. 'Are all the objects around me, all the clothes I put on, all the things I pick up, all of them sexual symbols and nothing else?' There is really ground enough for raising astonished questions, and, as a first one, we may enquire how we in fact come to know the meaning of these dream symbols, upon which the dreamer himself gives us insufficient information or none at all.

My reply is that we learn it from very different sources from fairy tales and myths, from buffoonery and jokes, from folklore (that is, from knowledge about popular manners and customs, sayings and songs) and from poetic and colloquial linguistic usage. In all these directions we come upon the same symbolism, and in some of them we can understand it without further instruction. If we go into these sources in detail, we shall find so many parallels to dream-symbolism that we cannot fail to be convinced of our interpretations.

According to Scherner, as we have said, the human body is often represented in dreams by the symbol of a house. Carrying this representation further, we found that windows, doors and gates stood for openings in the body and that façades of houses were either smooth or provided with balconies and projections to hold on to. But the same symbolism is found in our linguistic usage - when we greet an acquaintance familiarly as an '*altes haus*' ['old house'], when we speak of giving someone '*eins aufs Dach!*' [a knock on the head, literally, 'one on the roof'], or when we say of someone else that 'he's not quite right in the upper storey'. In anatomy the orifices of the body are in so many words termed '*Leibespforten*' [literally, 'portals of the body'].

It seems surprising at first to find one's parents in dreams as an imperial or royal couple. But it has its parallel in fairy tales. It begins to dawn on us that the many fairy tales which begin 'Once upon a time there were a King and Queen' only mean to say that there were once a father and mother. In a family the children are jokingly called 'princes' and the eldest 'crown prince'. The King himself calls himself the father of his country. We speak of small children jokingly as '*Würmer*' ['worms'] and speak sympathetically of a child as '*der arme Wurm*' ['the poor worm'].

Let us go back to house-symbolism. When in a dream we make use of the projections on houses for catching hold of, we may be reminded of a common vulgar expression for well developed breasts: 'She's got something to catch hold of.' There is another popular expression in such cases: 'She's got plenty of wood in front of the house', which seems to confirm our interpretation of wood as a female, maternal symbol.

And, speaking of wood, it is hard to understand how that material came to represent what is maternal and female. But here comparative philology may come to our help. Our German word –‘*Holz*’ seems to come from the same root as the Greek ‘ὕλη [hulē]’, meaning ‘stuff’ ‘raw material’. This seems to be an instance of the not uncommon event of the general name of a material eventually coming to be reserved for some particular material. Now there is an island in the Atlantic named ‘Madeira’. This name was given to it by the Portuguese when they discovered it, because at that time it was covered all over with woods. For in the Portuguese language ‘*madeira*’ means ‘wood’. You will notice, however, that ‘*madeira*’ is only a slightly modified form of the Latin word ‘*materia*’, which once more means ‘material’ in general. But ‘*materia*’ is derived from ‘*mater*’, ‘mother’: the material out of which anything is made is, as it were, a mother to it. This ancient view of the thing survives, therefore, in the symbolic use of wood for ‘woman’ or ‘mother’.

Birth is regularly expressed in dreams by some connection with water: one falls into the water or one comes out of the water - one gives birth or one is born. We must not forget that this symbol is able to appeal in two ways to evolutionary truth. Not only are all terrestrial mammals, including man’s ancestors, descended from aquatic creatures (this is the more remote of the two facts), but every individual mammal, every human being, spent the first phase of its existence in water - namely as an embryo in the amniotic fluid in its mother’s uterus, and came out of that water when it was born. I do not say that the dreamer knows this; on the other hand, I maintain that he need not know it. There is something else that the dreamer probably knows from having been told it in his childhood; and I even maintain of that too that his knowledge of it contributed nothing to the construction of the symbol. He was told in his nursery that the stork brings the babies. But where does it fetch them from? From the pond, or from the stream - once again, then, from the water. One of my patients after he had been given this information - he was a little Count at the time - disappeared for a whole afternoon. He was found at last lying by the edge of the castle pool, with his little face bending over the surface of the water eagerly peering down to try and see the babies at the bottom.

In myths about the birth of heroes - to which Otto Rank has devoted a comparative study, the oldest being that of King Sargon of Agade (about 2800 B.C.) - a predominant part is played by exposure in the water and rescue from the water. Rank has perceived that these are representations of birth, analogous to those that are usual in dreams. If one rescues someone from the water in a dream, one is making one self into his mother, or simply into a mother. In myths a person who rescues a baby from the water is admitting that she is the baby's true mother. There is a well-known comic anecdote according to which an intelligent Jewish boy was asked who the mother of Moses was. He replied without hesitation: 'The Princess.' 'No', he was told, 'she only took him out of the water.' 'That's what *she* says', he replied, and so proved that he had found the correct interpretation of the myth.

Departure in dreams means dying. So, too, if a child asks where someone is who has died and whom he misses, it is common nursery usage to reply that he has gone on a journey. Once more I should like to contradict the belief that the dream symbol is derived from this evasion. The dramatist is using the same symbolic connection when he speaks of the after-life as 'the undiscovered country from whose bourn no *traveller* returns'. Even in ordinary life it is common to speak of 'the last journey'. Every one acquainted with ancient rituals is aware of how seriously (in the religion of Ancient Egypt, for instance) the idea is taken of a journey to the land of the dead. Many copies have survived of *The Book of the Dead*, which was supplied to the mummy like a Baedeker to take with him on the journey. Ever since burial-places have been separated from dwelling-places the dead person's last journey has indeed become a reality.

It is just as little the case that genital symbolism is something that is found only in dreams. Every one of you has probably at one time or another spoken impolitely of a woman as an '*alte Schachtel*' ['old box'], perhaps without knowing that you were using a genital symbol. In the New Testament we find woman referred to as 'the weaker vessel'. The Hebrew scriptures, written in a style that comes close to poetry, are full of sexually symbolic expressions, which have not always been correctly understood and whose exegesis (for instance, in the case of the Song of Solomon) has led to some misunderstandings. In later Hebrew literature it is very common to find a woman represented by a house, whose door stands for the sexual orifice. A man complains, for instance, in a case of lost virginity, that he has 'found the door open'. So, too, the symbol of a table for a woman in these writings. Thus, a woman says of her husband: 'I laid the table for him, but he turned it round.' Lame children are said to come about through the man's 'turning the table round'. I take these examples from a paper by Dr. L. Levy of Brunn.

The fact that ships, too, in dreams stand for women is made credible by the etymologists, who tell us that '*Schiff* [ship]' was originally the name of an earthenware vessel and is the same word as '*Schaff* [a dialect word meaning 'tub']'. That ovens represent women and the uterus is confirmed by the Greek legend of Periander of Corinth and his wife Melissa. The tyrant, according to Herodotus, conjured up the shade of his wife, whom he had loved passionately but had murdered out of jealousy, to obtain some information from her. The dead woman proved her identity by saying that he (Periander) had *pushed his bread into a cold oven*, as a disguise for an event which no one else could know of. In the periodical *Anthropophyteia*, edited by F. S. Krauss, an invaluable source of knowledge of sexual anthropology, we learn that in a particular part of Germany they say of a woman who has given birth to a child that '*her oven has come to pieces*'. Kindling fire, and everything to do with it, is intimately interwoven with sexual symbolism. Flame is always a male genital, and the fireplace, the hearth is its female counterpart.

If you may have felt surprised at the frequency with which landscapes are used in dreams to represent the female genitals, you can learn from mythology the part played by *Mother Earth* in the concepts and cults of the peoples of antiquity and how their view of agriculture was determined by this symbolism. You will perhaps be inclined to trace the fact that in dreams a room represents a woman to the common usage in our language by which '*Frau*' is replaced by '*Frauenzimmer*'¹ - the human being is replaced by the apartment allotted to her. Similarly we speak of the 'Sublime Porte', meaning the Sultan and his government. So too the title of the Ancient Egyptian ruler, 'Pharaoh', means simply 'Great Courtyard'. (In the Ancient East the courts between the double gateways of a city were public meeting-places like the market-places of the classical world.) This derivation, however, appears to be too superficial. It seems to me more likely that a room became the symbol of a woman as being the space which encloses human beings. We have already found 'house' used in a similar sense; and mythology and poetical language enable us to add 'city', 'citadel', 'castle' and 'fortress' as further symbols for 'woman'. The question could be easily settled from the dreams of people who do not speak or understand German. During the last few years I have mainly treated foreign-speaking patients, and I seem to remember that in their dreams too '*Zimmer*' ['room'] meant '*Frauenzimmer*', though they had no similar usage in their languages. There are other indications that the symbolic relation can go beyond the limits of language - which, incidentally was asserted long ago by an old investigator of dreams, Schubert. However, none of my dreamers were completely ignorant of German, so the decision must be left to psycho-analysts who can collect data from unilingual people in other countries.

¹ [Literally 'woman's apartment'. The word is very often used in German as a slightly derogatory synonym for 'woman'.]

There is scarcely one of the symbolic representations of the male genitals which does not recur in joking, vulgar or poetic usage, especially in the ancient classical dramatists. But here we meet not only the symbols which appear in dreams, but others besides - for instance tools employed in various operations, and particularly the plough. Moreover, the symbolic representation of masculinity leads us to a very extensive and much disputed region, which, on grounds of economy, we shall avoid. I should like, however, to devote a few words to one symbol, which, as it were, falls outside this class - the number 3. Whether this number owes its sacred character to this symbolic connection remains undecided. But what seems certain is that a number of tripartite things that occur in nature - the clover leaf, for instance - owe their use for coats of arms and emblems to this symbolic meaning. Similarly, the tripartite lily - the so-called *fleur-de-lis* - and the remarkable heraldic device of two islands so far apart as Sicily and the Isle of Man - the *triskeles* (three bent legs radiating from a centre) - seem to be stylized versions of the male genitals. Likenesses of the male organ were regarded in antiquity as the most powerful *apotropaic* (means of defence) against evil influences, and, in conformity with this, the lucky charms of our own day can all be easily recognized as genital or sexual symbols. Let us consider a collection of such things - as they are worn, for instance, in the form of small silver hanging trinkets: a four-leaved clover, a pig, a mushroom, a horse-shoe, a ladder, a chimney-sweep. The four-leaved clover has taken the place of the three-leaved one which is really suited to be a symbol. The pig is an ancient fertility symbol. The mushroom is an undoubted penis-symbol: there are mushrooms which owe their systematic name (*Phallus impudicus*) to their unmistakable resemblance to the male organ. The horseshoe copies the outline of the female genital orifice, while the chimney-sweep, who carries the ladder, appears in this company on account of his activities, with which sexual intercourse is vulgarly compared. (Cf. *Anthropophyteia*.) We have made the acquaintance of his ladder in dreams as a sexual symbol; here German linguistic usage comes to our help and shows us how the word '*steigen*' ['to climb', or 'to mount'] is used in what is *par excellence* a sexual sense. We say '*den Frauen nachsteigen*' ['to run' (literally 'climb') 'after women'], and '*ein alter Steiger*' ['an old rake' (literally 'climber')]. In French, in which the word for steps on a staircase is '*marches*', we find a precisely analogous term '*un vieux marcheur*'. The fact that in many large animals climbing or 'mounting' on the female is a necessary preliminary to sexual intercourse probably fits into this context.

'Pulling off a branch' as a symbolic representation of masturbation is not merely in harmony with vulgar descriptions of the act but has far-reaching mythological parallels. But that masturbation, or rather the punishment for it - castration -, should be represented by the falling out or pulling out of teeth is especially remarkable, since there is a counterpart to it in anthropology which can be known to only a very small number of dreamers. There seems to me no doubt that the circumcision practised by so many peoples is an equivalent and substitute for castration. And we now learn that certain primitive tribes in Australia carry out circumcision as a puberty rite (at the festival to celebrate a boy's attaining sexual maturity), while other tribes, their near neighbours, have replaced this act by the knocking out of a tooth.

Here I bring my account of these specimens to an end. They are only specimens. We know more on the subject; but you may imagine how much richer and more interesting a collection like this would be if it were brought together, not by amateurs like us, but by real professionals in mythology, anthropology, philology and folklore.

A few consequences force themselves on our notice; they cannot be exhaustive, but they offer us food for reflection.

In the first place we are faced by the fact that the dreamer has a symbolic mode of expression at his disposal which he does not know in waking life and does not recognize. This is as extraordinary as if you were to discover that your housemaid understood Sanskrit, though you know that she was born in a Bohemian village and never learnt it. It is not easy to account for this fact by the help of our psychological views. We can only say that the knowledge of symbolism is unconscious to the dreamer, that it belongs to his unconscious mental life. But even with this assumption we do not meet the point. Hitherto it has only been necessary for us to assume the existence of unconscious endeavours - endeavours, that is, of which, temporarily or permanently, we know nothing. Now, however, it is a question of more than this, of unconscious pieces of knowledge, of connections of thought, of comparisons between different objects which result in its being possible for one of them to be regularly put in place of the other. These comparisons are not freshly made on each occasion; they lie ready to hand and are complete, once and for all. This is implied by the fact of their agreeing in the case of different individuals - possibly, indeed, agreeing in spite of differences of language. What can be the origin of these symbolic relations? Linguistic usage covers only a small part of them. The multiplicity of parallels in other spheres of knowledge are mostly unknown to the dreamer; we ourselves have been obliged to collect them laboriously.

Secondly, these symbolic relations are not something peculiar to dreamers or to the dream-work through which they come to expression. This same symbolism, as we have seen, is employed by myths and fairy tales, by the people in their sayings and songs, by colloquial linguistic usage and by the poetic imagination. The field of symbolism is immensely wide, and dream symbolism is only a small part of it: indeed, it serves no useful purpose to attack the whole problem from the direction of dreams. Many symbols which are commonly used elsewhere appear in dreams very seldom or not at all. Some dream symbols are not to be found in all other fields but only, as you have seen, here and there. One gets an impression that what we are faced with here is an ancient but extinct mode of expression, of which different pieces have survived indifferent fields, one piece only here, another only there, a third, perhaps, in slightly modified forms in several fields. And here I recall the phantasy of an interesting psychotic patient, who imagined a 'basic language' of which all these symbolic relations would be residues.

Thirdly, it must strike you that the symbolism in the other fields I have mentioned is by no means solely sexual symbolism, whereas in dreams symbols are used almost exclusively for the expression of sexual objects and relations. This is not easily explained either. Are we to suppose that symbols which originally had a sexual significance later acquired another application and that, furthermore, the toning-down of representation by symbols into other kinds of representation may be connected with this? These questions can evidently not be answered so long as we have considered dream-symbolism alone. We can only hold firmly to the suspicion that there is a specially intimate relation between true symbols and sexuality.

In this connection we have been given an important hint during the last few years. A philologist, Hans Sperber, of Uppsala, who works independently of psycho-analysis, has put forward the argument that sexual needs have played the biggest part in the origin and development of speech. According to him, the original sounds of speech served for communication, and summoned the speaker's sexual partner; the further development of linguistic roots accompanied the working activities of primal man. These activities, he goes on, were performed in common and were accompanied by rhythmically repeated utterances. In this way a sexual interest became attached to work. Primal man made work acceptable, as it were, by treating it as an equivalent and substitute for sexual activity. The words enunciated during work in common thus had two meanings; they denoted sexual acts as well as the working activity equated with them. As time went on, the words became detached from the sexual meaning and fixed to the work. In later generations the same thing happened with new words, which had a sexual meaning and were applied to new forms of work. In this way a number of verbal roots would have been formed, all of which were of sexual origin and had subsequently lost their sexual meaning. If the hypothesis I have here sketched out is correct, it would give us a possibility of understanding dream symbolism. We should understand why dreams, which preserve something of the earliest conditions, have such an extraordinarily large number of sexual symbols, and why, in general, weapons and tools always stand for what is male, while materials and things that are worked upon stand for what is female. The symbolic relation would be the residue of an ancient verbal identity; things which were once called by the same name as the genitals could now serve as symbols for them in dreams.

The parallels we have found to dream-symbolism also allow us to form an estimate of the characteristic of psycho-analysis which enables it to attract general interest in a way in which neither psychology nor psychiatry has succeeded in doing. In the work of psycho-analysis links are formed with numbers of other mental sciences, the investigation of which promises results of the greatest value: links with mythology and philology, with folklore, with social psychology and the theory of religion. You will not be surprised to hear that a periodical has grown up on psycho-analytic soil whose sole aim is to foster these links. This periodical is known as *Imago*, founded in 1912 and edited by Hanns Sachs and Otto Rank. In all these links the share of psycho-analysis is in the first instance that of giver and only to a less extent that of receiver. It is true that this brings it an advantage in the fact that its strange findings become more familiar when they are met with again in other fields; but on the whole it is psycho-analysis which provides the technical methods and the points of view whose application in these other fields should prove fruitful. The mental life of human individuals, when subjected to psycho-analytic investigation, offers us the explanations with the help of which we are able to solve a number of riddles in the life of human communities or at least to set them in a true light.

Incidentally, I have said nothing at all to you yet as to the circumstances in which we can obtain our deepest insight into the hypothetical 'primal language' and as to the field in which most of it has survived. Until you know this you cannot form an opinion of its whole significance. For this field is that of the neuroses and its material is the symptoms and other manifestations of neurotic patients, for the explanation and treatment of which psycho-analysis was, indeed, created.

The fourth of my reflections takes us back to the beginning and directs us along our prescribed path. I have said that even if there were no dream-censorship dreams would still not be easily intelligible to us, for we should still be faced with the task of translating the symbolic language of dreams into that of our waking thought. Thus symbolism is a second and independent factor in the distortion of dreams, alongside of the dream-censorship. It is plausible to suppose, however, that the dream-censorship finds it convenient to make use of symbolism, since it leads towards the same end - the strangeness and incomprehensibility of dreams.

It will shortly become clear whether a further study of dreams may not bring us up against yet another factor that contributes to the distortion of dreams. But I should not like to leave the subject of dream-symbolism without once more touching on the problem of how it can meet with such violent resistance in educated people when the wide diffusion of symbolism in myths, religion, art and language is so unquestionable. May it not be that what is responsible is once again its connection with sexuality?

LECTURE XI

THE DREAM-WORK

LADIES AND GENTLEMEN, - When you have thoroughly grasped the dream-censorship and representation by symbols, you will not yet, it is true, have completely mastered the distortion in, dreams, but you will nevertheless be in a position to understand most dreams. In doing so you will make use of both of the two complementary techniques: calling up ideas that occur to the dreamer till you have penetrated from the substitute to the genuine thing and, on the ground of your own knowledge, replacing the symbols by what they mean. Later on we shall discuss some uncertainties that arise in this connection.

We can now take up once more a task that we tried to carry out previously with inadequate means, when we were studying the relations between the elements of dreams and the genuine things they stood for. We laid down four main relations of the kind: the relation of a part to a whole, approximation or allusion, the symbolic relation and the plastic representation of words. We now propose to undertake the same thing on a larger scale, by comparing the manifest content of a dream as a *whole* with the latent dream as it is revealed by interpretation.

I hope you will never again confuse these two things with each other. If you reach that point, you will probably have gone further in understanding dreams than most readers of my *Interpretation of Dreams*. And let me remind you once again that the work which transforms the latent dream into the manifest one is called the *dream-work*. The work which proceeds in the contrary direction, which endeavours to arrive at the latent dream from the manifest one, is our *work of interpretation*. This work of interpretation seeks to undo the dream-work. The dreams of infantile type which we recognize as obvious fulfilments of wishes have nevertheless experienced some amount of dream-work - they have been transformed from a wish into an actual experience and also, as a rule, from thoughts into visual images. In their case there is no need for interpretation but only for undoing these two transformations. The additional dream-work that occurs in other dreams is called 'dream-distortion', and this has to be undone by our work of interpretation.

Having compared the interpretations of numerous dreams, I am in a position to give you a summary description of what the dream-work does with the material of the latent dream-thoughts. I beg you, however, not to try to understand too much of what I tell you. It will be a piece of description which should be listened to with quiet attention.

The first achievement of the dream-work is *condensation*. By that we understand the fact that the manifest dream has a smaller content than the latent one, and is thus an abbreviated translation of it. Condensation can on occasion be absent; as a rule it is present, and very often it is enormous. It is never changed into the reverse; that is to say, we never find that the manifest dream is greater in extent or content than the latent one. Condensation is brought about (1) by the total omission of certain latent elements, (2) by only a fragment of some complexes in the latent dream passing over into the manifest one and (3) by latent elements which have something in common being combined and fused into a single unity in the manifest dream.

If you prefer it, we can reserve the term 'condensation' for the last only of these processes. Its results are particularly easy to demonstrate. You will have no difficulty in recalling instances from your own dreams of different people being condensed into a single one. A composite figure of this kind may look like A perhaps, but may be dressed like B, may do something that we remember C doing, and at the same time we may know that he is D. This composite structure is of course emphasizing something that the four people have in common. It is possible, naturally, to make a composite structure out of things or places in the same way as out of people, provided that the various things and places have in common something which is emphasized by the latent dream. The process is like constructing a new and transitory concept which has this common element as its nucleus. The outcome of this superimposing of the separate elements that have been condensed together is as a rule a blurred and vague image, like what happens if you take several photographs on the same plate.

The production of composite structures like these must be of great importance to the dream-work, since we can show that, where in the first instance the common elements necessary for them were missing, they are deliberately introduced - for instance, through the choice of the words by which a thought is expressed. We have already come across condensations and composite structures of this sort. They played a part in the production of some slips of the tongue. You will recall the young man who offered to '*begleitdigen*' [*begleiten* (accompany) + *beleidigen* (insult)] a lady. Moreover, there are jokes of which the technique is based on a condensation like this. But apart from these cases, it may be said that the process is something quite unusual and strange. It is true that counterparts to the construction of these composite figures are to be found in some creations of our imagination, which is ready to combine into a unity components of things that do not belong together in our experience - in the centaurs, for instance, and the fabulous beasts which appear in ancient mythology or in Böcklin's pictures. The 'creative' imagination, indeed, is quite incapable of *inventing* anything; it can only combine components that are strange to one another. But the remarkable thing about the procedure of the dream-work lies in what follows. The material offered to the dream-work consists of thoughts - a few of which may be objectionable and unacceptable, but which are correctly constructed and expressed. The dream-work puts these thoughts into another form, and it is a strange and incomprehensible fact that in making this translation (this rendering, as it were, into another script or language) these methods of merging or combining are brought into use. After all, a translation normally endeavours to preserve the distinctions made in the text and particularly to keep things that are similar separate. The dream-work, quite the contrary, tries to condense two different thoughts by seeking out (like a joke) an ambiguous word in which the two thoughts may come together. We need not try to understand this feature all at once, but it may become important for our appreciation of the dream-work.

But although condensation makes dreams obscure, it does not give one the impression of being an effect of the dream-censorship. It seems traceable rather to some mechanical or economic factor, but in any case the censorship profits by it.

The achievements of condensation can be quite extraordinary. It is sometimes possible by its help to combine two quite different latent trains of thought into one manifest dream, so that one can arrive at what appears to be a sufficient interpretation of a dream and yet in doing so can fail to notice a possible 'over-interpretation'.

In regard to the connection between the latent and the manifest dream, condensation results also in no simple relation being left between the elements in the one and the other. A manifest element may correspond simultaneously to several latent ones, and, contrariwise, a latent element may play a part in several manifest ones - there is, as it were, a criss-cross relationship. In interpreting a dream, moreover, we find that the associations to a single manifest element need not emerge in succession: we must often wait till the whole dream has been interpreted.

Thus the dream-work carries out a very unusual kind of transcription of the dream-thoughts: it is not a word-for-word or a sign-for-sign translation; nor is it a selection made according to fixed rules - as though one were to reproduce only the consonants in a word and to leave out the vowels; nor is it what might be described as a representative selection - one element being invariably chosen to take the place of several; it is something different and far more complicated.

The second achievement of the dream-work is *displacement*. Fortunately we have made some preliminary examination of this: for we know that it is entirely the work of the dream censorship. It manifests itself in two ways: in the first, a latent element is replaced not by a component part of itself but by something more remote - that is, by an allusion; and in the second, the psychical accent is shifted from an important element on to another which is unimportant, so that the dream appears differently centred and strange.

Replacing something by an allusion to it is a process familiar in our waking thought as well, but there is a difference. In waking thought the allusion must be easily intelligible, and the substitute must be related in its subject-matter to the genuine thing it stands for. Jokes, too, often make use of allusion. They drop the precondition of there being an association in subject matter, and replace it by unusual external associations such as similarity of sound, verbal ambiguity, and so on. But they retain the precondition of intelligibility: a joke would lose all its efficiency if the path back from the allusion to the genuine thing could not be followed easily. The allusions employed for displacement in dreams have set themselves free from both of these restrictions. They are connected with the element they replace by the most external and remote relations and are therefore unintelligible; and when they are undone, their interpretation gives the impression of being a bad joke or of an arbitrary and forced explanation dragged in by the hair of its head. For the dream-censorship only gains its end if it succeeds in making it impossible to find the path back from the allusion to the genuine thing.

Displacement of accent is unheard-of as a method of expressing thoughts. We sometimes make use of it in waking thought in order to produce a comic effect. I can perhaps call up the impression it produces of going astray if I recall an anecdote. There was a blacksmith in a village, who had committed a capital offence. The Court decided that the crime must be punished; but as the blacksmith was the only one in the village and was indispensable, and as on the other hand there were three tailors living there, one of *them* was hanged instead.

The third achievement of the dream-work is psychologically the most interesting. It consists in transforming thoughts into visual images. Let us keep it clear that this transformation does not affect *everything* in the dream-thoughts; some of them retain their form and appear as thoughts or knowledge in the manifest dream as well; nor are visual images the only form into which thoughts are transformed. Nevertheless they comprise the essence of the formation of dreams; this part of the dream-work is, as we already know, the second most regular one, and we have already made the acquaintance of the 'plastic' representation of words in the case of individual dream-elements.

It is clear that this achievement is not an easy one. To form some idea of its difficulties, let us suppose that you have under taken the task of replacing a political leading article in a news paper by a series of illustrations. You will thus have been thrown back from alphabetic writing to picture writing. In so far as the article mentioned people and concrete objects you will replace them easily and perhaps even advantageously by pictures; but your difficulties will begin when you come to the representation of abstract words and of all those parts of speech which indicate relations between thoughts - such as particles, conjunctions and so on. In the case of abstract words you will be able to help yourselves out by means of a variety of devices. For instance, you will endeavour to give the text of the article a different wording, which may perhaps sound less usual but which will contain more components that are concrete and capable of being represented. You will then recall that most abstract words are 'watered-down' concrete ones, and you will for that reason hark back as often as possible to the original concrete meaning of such words. Thus you will be pleased to find that you can represent the 'possession' of an object by a real, physical sitting down on it.¹ And the dream-work does just the same thing. In such circumstances you will scarcely be able to expect very great accuracy from your representation: similarly, you will forgive the dream-work for replacing an element so hard to put into pictures as, for example, 'adultery' [*Ehebruch*], literally, 'breach of marriage', by another breach - a broken leg [*Beinbruch*].² And in this way you will succeed to some extent in compensating for the clumsiness of the picture writing that is supposed to take the place of the alphabetic script.

¹ [The German word '*besitzen*' ('to possess') is more obviously connected with sitting than its English equivalent ('*sitzen*' = 'to sit').]

² While I am correcting the proofs of these pages chance has put into my hands a newspaper cutting which offers an unexpected confirmation of what I have written above:-

'DIVINE PUNISHMENT

'A Broken Arm for a Broken Marriage.

'Frau Alta M., wife of a militiaman, sued Frau Klementine K. for adultery. According to the statement of claim, Frau K. had carried on an illicit relationship with Karl M., while her own husband was at the front and was actually making her an allowance of 70 Kronen a month. Frau K. had already received a considerable amount of money from the plaintiff's husband, while she and her child had to live in hunger and poverty. Fellow-soldiers of her husband had informed her that Frau K. had visited taverns with M. and had sat there drinking till far into the night. On one occasion the defendant had asked the plaintiff's husband in the presence of several other soldiers whether he would not get a divorce soon from "his old woman" and set up with her. Frau K.'s caretaker also reported that she had repeatedly seen the plaintiff's husband in the house most incompletely dressed.

'Before a court in the Leopoldstadt Frau K. yesterday denied knowing M., so that there could be no question of her having intimate relations with him.

'A witness, Albertine M., stated, however, that she had surprised Frau K. kissing the plaintiff's husband.

'At a previous hearing, M., under examination as a witness, had denied having intimate relations with the defendant. Yesterday the Judge received a letter in which the witness withdrew the statements he had made on the earlier occasion and admitted that he had had a love-affair with Frau K. up till the previous June. He had only denied his relations with the defendant at the former hearing because she had come to him before the hearing and begged him on her knees to save her and say nothing. "Today", the witness wrote, "I feel compelled to make a full confession to the Court, for I have broken my left arm and this seems to me to be a divine punishment for my wrong-doing."

'The Judge stated that the penal offence had lapsed under the statute of limitations. The plaintiff then withdrew her claim and the defendant was discharged.'

For representing the parts of speech which indicate relations between thoughts - 'because', 'therefore', 'however', etc. - you will have no similar aids at your disposal; those constituents of the text will be lost so far as translation into pictures goes. In the same way, the dream-work reduces the content of the dream-thoughts to its raw material of objects and activities. You will feel pleased if there is a possibility of in some way hinting, through the subtler details of the pictures, at certain relations not in themselves capable of being represented. And just so does the dream-work succeed in expressing some of the content of the latent dream-thoughts by peculiarities in the *form* of the manifest dream-by its clarity or obscurity, by its division into several pieces, and so on. The number of part dreams into which a dream is divided usually corresponds to the number of main topics or groups of thoughts in the latent dream. A short introductory dream will often stand in the relation of a prelude to a following, more detailed, main dream or may give the motive for it; a subordinate clause in the dream-thoughts will be replaced by the interpolation of a change of scene into the manifest dream, and so on. Thus the form of dreams is far from being without significance and itself calls for interpretation. When several dreams occur during the same night, they often have the same meaning and indicate that an attempt is being made to deal more and more efficiently with a stimulus of increasing insistence. In individual dreams a particularly difficult element may be represented by several symbols - by 'doublets'.

If we make a series of comparisons between the dream-thoughts and the manifest dreams which replace them, we shall come upon all kinds of things for which we are unprepared: for instance, that nonsense and absurdity in dreams have their meaning. At this point, indeed, the contrast between the medical and the psycho-analytic view of dreams reaches a pitch of acuteness not met with elsewhere. According to the former, dreams are senseless because mental activity in dreams has abandoned all its powers of criticism; according to our view, on the contrary, dreams become senseless when a piece of criticism included in the dream-thoughts - a judgement that 'this is absurd' - has to be represented. The dream you are familiar with of the visit to the theatre ('three tickets for 1 florin 50') is a good example of this. The judgement it expressed was: 'it was absurd to marry so early.'

Similarly, in the course of our work of interpretation we learn what it is that corresponds to the doubts and uncertainties which the dreamer so often expresses as to whether a particular element occurred in a dream, whether it was this or whether, on the contrary, it was something else. There is as a rule nothing in the latent dream-thoughts corresponding to these doubts and uncertainties; they are entirely due to the activity of the dream-censorship and are to be equated with an attempt at elimination which has not quite succeeded.

Among the most surprising findings is the way in which the dream-work treats contraries that occur in the latent dream. We know already that conformities in the latent material are replaced by condensations in the manifest dream. Well, contraries are treated in the same way as conformities, and there is a special preference for expressing them by the same manifest element. Thus an element in the manifest dream which is capable of having a contrary may equally well be expressing either itself or its contrary or both together: only the sense can decide which translation is to be chosen. This connects with the further fact that a representation of 'no' - or at any rate an unambiguous one - is not to be found in dreams.

A welcome analogy to this strange behaviour of the dream-work is provided for us in the development of language. Some philologists have maintained that in the most ancient languages contraries such as 'strong-weak', 'light-dark', 'big-small' are expressed by the same verbal roots. (What we term 'the antithetical meaning of primal words.')

Thus in Ancient Egyptian '*ken*' originally meant 'strong' and 'weak'. In speaking, misunderstanding from the use of such ambivalent words was avoided by differences of intonation and by the accompanying gesture, and in writing, by the addition of what is termed a 'determinative' - a picture which is not itself intended to be spoken. For instance, '*ken*' meaning 'strong' was written with a picture of a little upright man after the alphabetic signs; when '*ken*' stood for 'weak', what followed was the picture of a man squatting down limply. It was only later, by means of slight modifications of the original homologous word, that two distinct representations were arrived at of the contraries included in it. Thus from '*ken*' 'strong-weak' were derived '*ken*' 'strong' and '*kan*' 'weak'. The remains of this ancient antithetical meaning seem to have been preserved not only in the latest developments of the oldest languages but also in far younger ones and even in some that are still living. Here is some evidence of this, derived from K. Abel (1884).

In Latin, words that remained ambivalent in this way are '*altus*' ('high' and 'deep') and '*sacer*' ('sacred' and 'accursed').

As instances of modifications of the same root I may mention '*clamare*' ('to cry'), '*clam*' ('softly', 'quietly', 'secretly'); '*siccus*' ('dry'), '*succus*' ('juice'). And in German: '*Stimme*' ['voice'], '*stumm*' ['dumb'].

If we compare related languages, there are numerous examples. In English, 'to lock'; in German, '*Loch*' ['hole'] and '*Lücke*' ['gap']. In English, 'to cleave'; in German, '*kleben*' ['to stick'].

The English word 'without' (which is really 'with-without') is used to-day for 'without' alone. 'With', in addition to its combining sense, originally had a removing one; this is still to be seen in the compounds 'withdraw' and 'withhold'. Similarly with the German '*wieder*' ['together with'] and '*wider*' 'against'].

Another characteristic of the dream-work also has its counterpart in the development of language. In Ancient Egyptian, as well as in other, later languages, the order of the sounds in a word can be reversed, while keeping the same meaning. Examples of this in English and German are: 'Topf' ['pot']-'pot'; 'boat'- 'tub'; 'hurry'- '*Ruhe*' ['rest']; '*Balken*' ['beam']-'*Kloben*' ['log'] and 'club'; 'wait'- '*täuwen*' ['tarry']. Similarly in Latin and German: '*capere*'-'*packen*' ['to seize']; '*ren*'-'*Niere*' ['kidney'].

Reversals like this, which occur here with individual words, take place in various ways in the dream-work. We already know reversal of meaning, replacement of something by its opposite. Besides this we find in dreams reversals of situation, of the relation between two people - a 'topsy-turvy' world. Quite often in dreams it is the hare that shoots the sportsman. Or again we find a reversal in the order of events, so that what precedes an event causally comes after it in the dream - like a theatrical production by a third-rate touring company, in which the hero falls down dead and the shot that killed him is not fired in the wings till afterwards. Or there are dreams where the whole order of the elements is reversed, so that to make sense in interpreting it we must take the last one first and the first one last. You will remember too from our study of dream symbolism that going or falling into the water means the same as coming out of it - that is, giving birth or being born, and that climbing up a staircase or a ladder is the same thing as coming down it. It is not hard to see the advantage that dream-distortion can derive from this freedom of representation.

These features of the dream-work may be described as *archaic*. They are equally characteristic of ancient systems of expression by speech and writing and they involve the same difficulties, which we shall have to discuss again later in a critical sense.

And now a few more considerations. In the case of the dream-work it is clearly a matter of transforming the latent thoughts which are expressed in words into sensory images, mostly of a visual sort. Now our thoughts originally arose from sensory images of that kind: their first material and their preliminary stages were sense impressions, or, more properly, mnemonic images of such impressions. Only later were words attached to them and the words in turn linked up into thoughts. The dream-work thus submits thoughts to a *regressive* treatment and undoes their development; and in the course of the regression everything has to be dropped that had been added as a new acquisition in the course of the development of the mnemonic images into thoughts.

Such then, it seems, is the dream-work. As compared with the processes we have come to know in it, interest in the manifest dream must pale into insignificance. But I will devote a few more remarks to the latter, since it is of it alone that we have immediate knowledge.

It is natural that we should lose some of our interest in the manifest dream. It is bound to be a matter of indifference to us whether it is well put together, or is broken up into a series of disconnected separate pictures. Even if it has an apparently sensible exterior, we know that this has only come about through dream-distortion and can have as little organic relation to the internal content of the dream as the façade of an Italian church has to its structure and plan. There are other occasions when this façade of the dream *has* its meaning, and reproduces an important component of the latent dream-thoughts with little or no distortion. But we cannot know this before we have submitted the dream to interpretation and have been able to form a judgement from it as to the amount of distortion that has taken place. A similar doubt arises when two elements in a dream appear to have been brought into a close relation to each other. This may give us a valuable hint that we may bring together what corresponds to these elements in the latent dream as well; but on other occasions we can convince ourselves that what belongs together in the dream-thoughts has been torn apart in the dream.

In general one must avoid seeking to explain one part of the manifest dream by another, as though the dream had been coherently conceived and was a logically arranged narrative. On the contrary, it is as a rule like a piece of breccia, composed of various fragments of rock held together by a binding medium, so that the designs that appear on it do not belong to the original rocks imbedded in it. And there is in fact one part of the dream-work, known as 'secondary revision', whose business it is to make something whole and more or less coherent out of the first products of the dream-work. In the course of this, the material is arranged in what is often a completely misleading sense and, where it seems necessary, interpolations are made in it.

On the other hand, we must not over-estimate the dream-work and attribute too much to it. The achievements I have enumerated exhaust its activity; it can do no more than condense, displace, represent in plastic form and subject the whole to a secondary revision. What appear in the dream as expressions of judgement, of criticism, of astonishment or of inference - none of these are achievements of the dream-work and they are very rarely expressions of afterthoughts about the dream; they are for the most part portions of the latent dream-thoughts which have passed over into the manifest dream with a greater or less amount of modification and adaptation to the context. Nor can the dream-work compose speeches. With a few assignable exceptions, speeches in dreams are copies and combinations of speeches which one has heard or spoken one self on the day before the dream and which have been included in the latent thoughts either as material or as the instigator of the dream. The dream-work is equally unable to carry out calculations. Such of them as appear in the manifest dream are mostly combinations of numbers, sham calculations which are quite senseless *quâ* calculations and are once again only copies of calculations in the latent dream-thoughts. In these circumstances it is not to be wondered at that the interest which had turned to the dream-work soon tends to move away from it to the latent dream-thoughts, which are revealed, distorted to a greater or less degree, by the manifest dream. But there is no justification for carrying this shift of interest so far that, in looking at the matter theoretically, one replaces the dream entirely by the latent dream-thoughts and makes some assertion about the former which only applies to the latter. It is strange that the findings of psycho-analysis could be misused to bring about this confusion. One cannot give the name of 'dream' to anything other than the product of the dream-work - that is to say, the *form* into which the latent thoughts have been transmuted by the dream-work.

The dream-work is a process of quite a singular kind, of which the like has not yet become known in mental life. Condensations, displacements, regressive transformations of thoughts into images - such things are novelties whose discovery has already richly rewarded the labours of psycho-analysis. And you can see once more, from the parallels to the dream-work, the connections which have been revealed between psycho-analytic studies and other fields - especially those concerned in the development of speech and thought. You will only be able to form an idea of the further significance of these discoveries when you learn that the mechanism of dream-construction is the model of the manner in which neurotic symptoms arise.

I am also aware that we are not yet able to make a survey of the whole of the new acquisitions which these studies have brought to psychology. I will only point out the fresh proofs they have provided of the existence of unconscious mental acts - for this is what the latent dream-thoughts are - and what an unimaginably broad access to a knowledge of unconscious mental life we are promised by the interpretation of dreams.

But now the time has no doubt come for me to demonstrate to you from a variety of small examples of dreams what I have been preparing you for in the course of these remarks.

LECTURE XII

SOME ANALYSES OF SAMPLE DREAMS

LADIES AND GENTLEMEN, - You must not be disappointed if I once again put before you fragments of dream-interpretations instead of inviting you to take part in the interpretation of a nice big dream. You will argue that after so many preparations you have a right to it, and you will express your conviction that after so many thousands of dreams have been successfully interpreted, it should have been possible long since to have brought together a collection of excellent sample dreams on which all our assertions about the dream-work and the dream-thoughts could be demonstrated. Just so. But the difficulties that stand in the way of the fulfilment of your wish are too many.

In the first place I must admit that no one carries on the interpretation of dreams as his main occupation. How does it come about, then, that people do interpret them? Occasionally, with no particular end in view, one may interest oneself in the dreams of an acquaintance, or one may work through one's own dreams for a time in order to train oneself in psycho-analytic work; but for the most part what one has to deal with are the dreams of neurotic patients who are under psycho-analytic treatment. These latter dreams are excellent material and are in no way inferior to those of healthy people; but the technique of the treatment necessitates our subordinating dream-interpretation to therapeutic aims, and we have to allow a whole number of dreams to drop after we have extracted something from them that is of service to the treatment. Some dreams that occur during treatment entirely escape any full analysis: since they have arisen out of the great mass of psychical material which is still unknown to us, it is impossible to understand them before the treatment is finished. If I were to report dreams of this kind, it would oblige me to uncover all the secrets of a neurosis as well; and that will not do for us, since it is precisely to prepare us for the study of the neuroses that we have attacked the problem of dreams.

You, however, would be glad to dispense with this material and would prefer to be given an explanation of the dreams of healthy people or of your own dreams. But this cannot be done, on account of their content. It is impossible to submit either oneself or anyone else whose confidence one enjoys to the ruthless exposure that would be involved in a detailed analysis of his dreams, which, as you already know, are concerned with the most intimate part of one's personality. But there is another difficulty in the way apart from that of providing the material. You are aware that dreams present an alien appearance to the dreamer himself, and much more so to anyone who is unacquainted with him personally. Our literature is not poor in good and detailed dream-analyses. I myself have published a few within the framework of case histories. Perhaps the best example of the interpretation of a dream is the one reported by Otto Rank consisting of two interrelated dreams dreamt by a young girl, which occupy about two pages of print: but their analysis extends to seventy-six pages. So I should need something like a whole term to conduct you through a piece of work of the sort. If one takes up any comparatively long and much distorted dream, one has to give so many explanations of it, to bring up so much material in the way of associations and memories, to follow up so many by-paths, that a lecture about it would be quite confusing and unsatisfactory. I must therefore ask you to be content with what can be had more easily - an account of small pieces of the dreams of neurotic patients, in which it is possible to recognize this or that point in isolation. What is easiest to demonstrate are dream-symbols and, after them, some characteristics of the regressive representation in dreams. In the case of each of the dreams that follow, I will indicate why it is that I think it worth reporting.

(1) This dream consisted only of two short pictures: *His uncle was smoking a cigarette although it was Saturday. - A woman was caressing and fondling him as though he were her child.*

In regard to the first picture the dreamer (a Jew) remarked that his uncle was a pious man who never had done and never could do anything sinful like that. In regard to the woman in the second picture nothing occurred to him except his mother. These two pictures or thoughts must obviously be seen in connection with each other. But how? Since he expressly disputed the reality of his uncle's action, it is plausible to insert an 'if': 'If my uncle, that pious man, were to smoke a cigarette on a Saturday, then I might let myself, too, be cuddled by my mother.' This clearly means that cuddling with his mother was something impermissible, like smoking on a Saturday to a pious Jew. - You will recall that I told you that in the course of the dream-work all the relations between the dream-thoughts drop out; these are resolved into their raw material and it is the task of the interpretation to re-insert the omitted relations.

(2) As a result of my publications on dreams I have in a sense become a public consultant on matters relating to them, and for many years I have been receiving communications from the most various sources in which dreams are reported to me or submitted to my judgement. I am of course grateful to anyone who adds enough material to the dream to make an interpretation possible or who gives an interpretation himself. The following dream, dreamt by a medical student in Munich and dating from the year 1910, falls into this category. I am bringing it up in order to show you how impossible it is in general to understand a dream till the dreamer has given us his information about it. For I suspect that at bottom you consider that the ideal method of dream-interpretation is by filling in the meaning of the symbols and that you would like to discard the technique of obtaining associations to the dream; and I am anxious to disabuse you of this damaging mistake.

'July 13, 1910 - Towards morning I had this dream: *I was bicycling down the street in Tübingen when a brown dachshund rushed up behind me and seized me by the heel. After a little I got off, sat down on a step, and began to hit at the beast, which had bitten firm hold of me.* (I had no disagreeable feelings either from the bite or from the scene as a whole.) *Some elderly ladies were sitting opposite me and grinning at me. Then I woke up and, as has often happened before, at the moment of transition to waking, the whole dream was clear to me.*'

Symbols are of little help here. But the dreamer reported: 'I have recently fallen in love with a girl, but only from seeing her in the street, and I have had no means of getting in contact with her. The dachshund might have been the pleasantest way of doing so, especially as I am a great animal-lover and I liked this same characteristic in the girl.' He added that he had repeatedly intervened in furious dog-fights with great skill and often to the astonishment of the onlookers. We learn then that the girl he was attracted by was always to be seen in the company of this particular dog. As far as the manifest dream was concerned, however, the girl was omitted and only the dog associated with her was left. The elderly ladies who grinned at him may perhaps have taken the girl's place. His further remarks threw no adequate light on this point. The fact that he was bicycling in the dream is a direct repetition of the remembered situation. He never met the girl with the dog except when he was on his bicycle.

(3) When anyone has lost someone near and dear to him, he produces dreams of a special sort for some time afterwards, in which knowledge of the death arrives at the strangest compromises with the need to bring the dead person to life again. In some of these dreams the person who has died is dead and at the same time still alive, because he does not know he is dead; only if he did know would he die completely. In others, he is half dead and half alive, and each of these states is indicated in a particular way. We must not describe these dreams as simply nonsensical; for being brought to life again is no more inconceivable in dreams than it is, for instance, in fairy tales, in which it occurs as a very usual event. So far as I have been able to analyse such dreams, it has turned out that they are capable of a reasonable solution, but that the pious wish to bring the dead person back to life has been able to operate by the strangest means. I will now put before you a dream of this kind which sounds sufficiently queer and senseless and the analysis of which will show you much for which our theoretical discussions will have prepared you. It is the dream of a man who had lost his father several years before:

His father was dead but had been exhumed and looked bad. He had been living since then and the dreamer was doing all he could to prevent him noticing it. (The dream then went on to other and apparently very remote matters.)

His father was dead; we know that. His having been exhumed did not correspond to reality; and there was no question of reality in anything that followed. But the dreamer reported that after he had come away from his father's funeral, one of his teeth began to ache. He wanted to treat the tooth according to the precept of Jewish doctrine: 'If thy tooth offend thee, pluck it out!' And he went off to the dentist. But the dentist said: 'One doesn't pluck out a tooth. One must have patience with it. I'll put something into it to kill it; come back in three days and I'll take it out.'

'That "take out",' said the dreamer suddenly, 'that's the exhuming!'

Was the dreamer right about this? It only fits more or less, not completely; for the *tooth* was not taken out, but only something in it that had died. But inaccuracies of this kind can, on the evidence of other experiences, well be attributed to the dream-work. If so, the dreamer had condensed his dead father and the tooth that had been killed but retained; he had fused them into a unity. No wonder, then, that something senseless emerged in the manifest dream, for, after all, not everything that was said about the tooth could fit his father. Where could there possibly be a *tertium comparationis* between the tooth and his father, to make the condensation possible?

But no doubt he must have been right, for he went on to say that he knew that if one dreams of a tooth falling out it means that one is going to lose a member of one's family.

This popular interpretation, as we know, is incorrect or at least is correct only in a scurrilous sense. We shall be all the more surprised to find the topic thus touched upon re-appearing behind other portions of the dream's content.

The dreamer now began, without any further encouragement, to talk about his father's illness and death as well as about his own relations with him. His father was ill for a long time, and the nursing and treatment had cost him (the son) a lot of money. Yet it was never too much, he was never impatient, he never wished that after all it might soon come to an end. He was proud of his truly Jewish filial piety towards his father, of his strict obedience to Jewish Law. And here we are struck by a contradiction in the thoughts belonging to the dream. He had identified the tooth and his father. He wanted to proceed with the tooth in accordance with Jewish Law, which commanded him to pluck it out if it caused him pain or offence. He also wanted to proceed with his father, too, in accordance with the precepts of the Law, but in this case it commanded him to spare no expense or trouble, to take every burden on himself and to allow no hostile intention to emerge against the object that was causing him pain. Would not the two attitudes have agreed much more convincingly if he had really developed feelings towards his sick father similar to those towards his sick tooth - that is, if he had wished that an early death would put an end to his unnecessary, painful and costly existence?

I do not doubt that this was really his attitude towards his father during the tedious illness and that his boastful assurances of his filial piety were meant to distract him from these memories. Under such conditions the death-wish against a father is apt to become active and to hide itself under the mask of such sympathetic reflections as that 'it would be a happy release for him'. But please observe that here we have passed a barrier in the latent dream-thoughts themselves. No doubt the first portion of them was unconscious only temporarily - that is, during the construction of the dream; but his hostile impulses against his father must have been permanently unconscious. They may have originated from scenes in his childhood and have occasionally slipped into consciousness, timidly and disguised, during his father's illness. We can assert this with greater certainty of other latent thoughts which have made unmistakable contributions to the content of the dream. Nothing, indeed, is to be discovered in the dream of his hostile impulses towards his father. But if we look for the roots of such hostility to a father in childhood, we shall recall that fear of a father is set up because, in the very earliest years, he opposes a boy's sexual activities, just as he is bound to do once more from social motives after the age of puberty. This relation to his father applies to our dreamer as well: his love for him included a fair admixture of awe and anxiety, which had their source in his having been early deterred by threats from sexual activity.

The remaining phrases in the manifest dream can be explained now in relation to the masturbation complex. '*He looked bad*' is indeed an allusion to another remark of the dentist's to the effect that it looks bad if one has lost a tooth in that part of the mouth; but it relates at the same time to the 'looking bad' by which a young man at puberty betrays, or is afraid he betrays, his excessive sexual activity. It was not without relief to his own feelings that in the manifest content the dreamer displaced the 'looking bad' from himself on to his father - one of the kinds of reversal by the dream-work which is familiar to you. '*He had been living since then*' coincides with the wish to bring back to life as well as with the dentist's promise that the tooth would survive. The sentence 'the dreamer was doing all he could *to prevent him (his father) noticing it*' is very subtly devised to mislead us into thinking that it should be completed by the words 'that he was dead'. The only completion, however, that makes sense comes once more from the masturbation complex; in that connection it is self-evident that the young man did all he could to conceal his sexual life from his father. And finally, remember that we must always interpret what are called 'dreams with a dental stimulus' as relating to masturbation and the dreaded punishment for it.

You can see now how this incomprehensible dream came about. It was done by producing a strange and misleading condensation, by disregarding all the thoughts that were in the centre of the latent thought-process and by creating ambiguous substitutes for the deepest and chronologically most remote of those thoughts.

(4) We have already tried repeatedly to come to understand the matter-of-fact and commonplace dreams which have nothing senseless or strange about them but which raise the question of why one should dream about such indifferent stuff. I will therefore offer you another example of this kind - three interconnected dreams dreamt by a young lady in one night.

(a) *She was walking across the hall of her house and struck her head against a low-hanging chandelier and drew blood.*

No reminiscence, nothing that had really happened. The information she produced in response to it led in quite other directions. 'You know how badly my hair's falling out. "My child," my mother said to me yesterday, "if this goes any further you'll have a head as smooth as a bottom."' So here the head stands for the other end of the body. We can understand the chandelier, without any help, as a symbol: all objects capable of being lengthened are symbols of the male organ. It was therefore a matter of bleeding at the lower end of the body, which had arisen from contact with a penis. This might still be ambiguous. Her further associations showed that what was in question concerned a belief that menstrual bleeding arises from sexual intercourse with a man - a piece of sexual theory which counts many faithful believers among immature girls.

(b) *She saw a deep pit in the vineyard, which she knew had been caused by a tree being torn out.* She added a remark that the tree *was missing*. She meant that she had not seen the tree in her dream; but the same wording served to express another thought which made the symbolic interpretation quite certain. The dream referred to another piece of infantile sexual theory - to the belief that girls originally had the same genitals as boys and that their later shape was the result of castration (the tearing out of a tree).

(c) *She was standing in front of the drawer of her writing-table which she was so familiar with that she could tell at once if anyone had been into it.* Like all drawers, chests and cases, the writing-table drawer stood for the female genitals. She knew that indications of sexual intercourse (and, as she thought, of touching) could be observed on the genitals and had long feared such a discovery. In all these three dreams, I think, the accent is to be placed on *knowledge*. She was recalling the period of her sexual researches when she was a child, of whose outcome she had been quite proud at the time.

(5) Here is a little more symbolism. But this time I must start with a short preamble on the psychical situation. A gentleman who had passed a night in intercourse with a lady described her as one of those motherly characters in whom the wish for a child breaks irresistibly through in intercourse with a man. The circumstances of this meeting, however, called for a precaution which prevented the fertilizing semen from reaching the woman's uterus. On waking up after this night the woman reported the following dream:

An officer in a red cap was running after her in the street. She fled from him, and ran up the stairs with him still after her. Breathless, she reached her flat, slammed the door behind her and locked it. He stayed outside, and when she looked through the peep-hole, he was sitting on a bench outside and weeping.

You will no doubt recognize the pursuit by the officer in the red cap and the breathless climbing upstairs as representing the sexual act. The fact that it was the dreamer who locked herself up against her pursuer will serve as an example of the reversals that are used so commonly in dreams, for it was the man who had avoided the consummation of the sexual act. In the same way, her grief was displaced on to the man, for it was he who wept in the dream - and this was simultaneously a representation of the emission of semen.

I feel sure that you have heard some time or other that it is asserted by psycho-analysis that every dream has a sexual meaning. Well, you yourselves are in a position to form a judgement of the incorrectness of this reproach. You have become acquainted with wishful dreams dealing with the satisfaction of the most obvious needs - hunger and thirst and the longing for freedom - with dreams of convenience and of impatience, and also with purely covetous and egoistic dreams. But at the same time you should bear in mind, as one of the results of psycho-analytic research, that greatly distorted dreams give expression mainly (though, again, not exclusively) to sexual wishes.

(6) I have a particular reason for piling up instances of the use of symbols in dreams. At our first meeting I lamented the difficulty of providing demonstrations and so of carrying conviction in giving instruction in psycho-analysis. And I have no doubt that you have since come to agree with me. But the different theses of psycho-analysis are so intimately connected that conviction can easily be carried over from a single point to a larger part of the whole. It might be said of psycho-analysis that if anyone holds out a little finger to it it quickly grasps his whole hand. No one, even, who has accepted the explanation of parapraxes can logically withhold his belief in all the rest. A second, equally accessible position is offered by dream-symbolism. Here is the dream of an uneducated woman whose husband was a policeman and who had certainly never heard anything about dream-symbolism or psycho-analysis. Then judge for yourselves whether its explanation by the help of sexual symbols can be called arbitrary and forced:

' . . . Then someone broke into the house and she was frightened and called out for a policeman. But he had gone into a church, to which a number of steps led up, accompanied amicably by two tramps. Behind the church there was a hill and above it a thick wood. The policeman was dressed in a helmet, gorget and cloak. He had a brown beard. The two tramps, who went along peaceably with the policeman, had sack-like aprons tied round their middles. In front of the church a path led up to the hill; on both sides of it there grew grass and brushwood, which became thicker and thicker and, at the top of the hill, turned into a regular wood.'

You will have no trouble in recognizing the symbols used. The male genitals are represented by a triad of figures, and the female ones by a landscape with a chapel, hill and wood. Once again you find steps as a symbol for the sexual act. What is called a hill in the dream is also called one in anatomy - the Mons Veneris.

(7) And here is yet another dream that must be solved by the insertion of symbols. It is notable and convincing from the fact that the dreamer himself translated all the symbols, though he had no sort of previous theoretical knowledge of dream-interpretation. Such an attitude is quite unusual and its determinants are not precisely understood:

'He was going for a walk with his father in a place which must certainly have been the Prater, since he saw the Rotunda, with a small annex in front of it to which a captive balloon was attached, though it looked rather limp. His father asked him what all this was for; he was surprised at his asking, but explained it to him. Then they came into a courtyard which had a large sheet of tin laid out in it. His father wanted to pull off a large piece of it, but first looked around to see if anyone was watching. He told him that he need only tell the foreman and he could take some without any bother. A staircase led down from this yard into a shaft, whose walls were cushioned in some soft material, rather like a leather armchair. At the end of the shaft was a longish platform and then another shaft started. . . .'

The dreamer himself interpreted: 'The Rotunda was my genitals and the captive balloon in front of it was my penis, whose limpness I have reason to complain of.' Going into greater detail, then, we may translate the Rotunda as the bottom (habitually regarded by children as part of the genitals) and the small annex in front of it as the scrotum. His father asked him in the dream what all this was - that is, what was the purpose and function of the genitals. It seemed plausible to reverse this situation and turn the dreamer into the questioner. Since he had in fact never questioned his father in this way, we had to look upon the dream-thought as a wish, or take it as a conditional clause, such as: 'If I had asked my father for sexual enlightenment. . . .' We shall presently find the continuation of this thought in another part of the dream.

The courtyard in which the sheet of tin was spread out is not to be taken symbolically in the first instance. It was derived from the business premises of the dreamer's father. For reasons of discretion I have substituted 'tin' for another material in which his father actually dealt: but I have made no other change in the wording of the dream. The dreamer had entered his father's business and had taken violent objection to the somewhat dubious practices on which the firm's earnings in part depended. Consequently the dream-thought I have just interpreted may have continued in this way: '(If I had asked him), he would have deceived me just as he deceives his customers.' As regards the 'pulling off' which served to represent his father's dishonesty in business, the dreamer himself produced a second explanation - namely that it stood for masturbating. Not only have we long been familiar with this interpretation, but there was something to confirm it in the fact that the secret nature of masturbation was represented by its reverse: it might be done openly. Just as we should expect, the masturbatory activity was once again displaced on to the dreamer's father, like the questioning in the first scene of the dream. He promptly interpreted the shaft as a vagina, having regard to the soft cushioning of its walls. I added on my own authority that climbing down, like climbing up in other cases, described sexual intercourse in the vagina.

The dreamer himself gave a biographical explanation of the further details - that the first shaft was followed by a longish platform and then by another shaft. He had practised intercourse for a time but had then given it up on account of inhibitions, and he now hoped to be able to resume it by the help of the treatment.

(8) The two following dreams were dreamt by a foreigner of a highly polygamous disposition. I repeat them to you as evidence for my assertion that the dreamer's own ego appears in every dream even if it is concealed in the manifest content. The trunks in the dreams were symbols of women:

(a) He was starting on a journey; his luggage was taken to the station on a carriage, a number of trunks piled up on it, and among them two big black ones, like boxes of samples. He said to someone consolingly: 'Well, they're only going with me as far as the station.'

He did in fact travel with a great deal of luggage; but he also brought a great many stories about women into the treatment. The two black trunks corresponded to two dark women who were at the time playing the main part in his life. One of them had wanted to follow him to Vienna; and on my advice he had telegraphed to put her off.

(b) A scene at the customs-house: Another traveller opened his box and, coolly smoking a cigarette, said: 'There's nothing in it.' The customs officer seemed to believe him, but felt about once more inside it, and found something quite particularly prohibited. The traveller said in a resigned voice: 'There's nothing to be done about it.'

He himself was the traveller: I was the customs officer. As a rule he was very straightforward in making admissions; but he had intended to keep silent to me about a new connection he had formed with a lady, because he rightly supposed that she was not unknown to me. He displaced the distressing situation of being detected on to a stranger, so that he himself did not seem to appear in the dream.

(9) Here is an example of a symbol which I have not yet mentioned:

He met his sister in the company of two women friends who were themselves sisters. He shook hands with both of them but not with his sister.

No connection with any real occurrence. But his thoughts took him back, rather, to a period in which his observations led him to reflect on how late girls' breasts developed. So the two sisters were breasts; he would have liked to take hold of them with his hand - if only it were not his sister.

(10) Here is an example of death-symbolism in a dream:

He was walking with two people whose names he knew but had forgotten when he woke up, across a very high, steep iron bridge. Suddenly they had both gone, and he saw a ghost-like man in a cap and linen clothes. He asked him if he was the telegraph-boy. No. Was he the driver? No. Then he walked on further. . . . While he was still dreaming he felt acute anxiety, and after he had woken up he continued the dream with a phantasy that the iron bridge suddenly broke and he fell into the abyss.

People of whom one insists that they are unknown or that one has forgotten their names are mostly people very near to one. The dreamer had a brother and sister; and if he had wished that these two were dead, it would be only fair that in return *he* should be victimized by a fear of death. Of the telegraph boy he remarked that such people always bring bad news. By his uniform he might equally have been the lamp-lighter; but he puts out the lamps as well, just as the Spirit of Death puts out the torch. The driver made him think of Uhland's poem about King Charles's Voyage, and reminded him of a dangerous sea-voyage with two companions during which he had played the part of the King in the poem. The iron bridge made him think of a recent accident and of the foolish saying: 'Life is a suspension bridge'.

(11) The following dream may count as another representation of death:

An unknown gentleman left a black-edged visiting-card on him.

(12) You will be interested in the following dream in a number of ways, though a neurotic state in the dreamer was one of its preconditions:

He was travelling in a railway-train. The train came to a stop in open country. He thought there was going to be an accident and that he must think of getting away. He went through all the coaches in the train and killed everyone he met - the guard, the engine-driver, and so on.

In connection with this he thought of a story told him by a friend. A lunatic was being conveyed in a compartment on an Italian line, but through carelessness a traveller was allowed in with him. The madman killed the other traveller. Thus he was identifying himself with the madman, and based his right to do so on an obsession by which he was tormented from time to time that he must 'get rid of all accessory witnesses'. But then he himself found a better reason, and this led to the precipitating cause of the dream. At the theatre the night before he had once more seen the girl whom he had wanted to marry but had withdrawn from because she had given him ground for being jealous. In view of the intensity reached by his jealousy he would, he thought, really be mad to want to marry her. This meant that he regarded her as so untrustworthy that, in his jealousy, he would have to kill everyone who came his way. We have already come across walking through a series of rooms (here, railway coaches) as a symbol of marriage (a reversal of 'monogamy').

In connection with the train coming to a stop in open country and his being afraid of an accident, he said that once when he was on a railway journey there had been a sudden stop of this kind when they were not in a station. A young lady who was travelling with him had said that there might be a collision and that the safest thing to do was to lift one's legs up high. But this 'lifting the legs high' had also played a part in the many walks and excursions in the country which he had taken with the other girl in the happy early days of their love. This was a fresh argument for thinking he would be mad to marry her now. But my knowledge of the situation made me feel certain that he nevertheless wished he were mad enough to do it.

LECTURE XIII

THE ARCHAIC FEATURES AND INFANTILISM OF DREAMS

LADIES AND GENTLEMEN, - Let us start out once more from the conclusion we arrived at that the dream-work, under the influence of the dream-censorship, transposes the latent dream-thoughts into a different mode of expression. The latent thoughts do not differ from our familiar conscious thoughts of waking life. The new mode of expression is incomprehensible to us owing to many of its features. We have said that it harks back to states of our intellectual development which have long since been superseded - to picture-language, to symbolic connections, to conditions, perhaps, which existed before our thought-language had developed. We have on that account described the mode of expression of the dream-work as *archaic* or *regressive*.

You may conclude from this that if we study the dream-work further we must succeed in gaining valuable light on the little known beginnings of our intellectual development. I hope it will be so; but this work has not so far been started upon. The prehistory into which the dream-work leads us back is of two kinds - on the one hand, into the individual's prehistory, his childhood, and on the other, in so far as each individual somehow recapitulates in an abbreviated form the entire development of the human race, into phylogenetic prehistory too. Shall we succeed in distinguishing which portion of the latent mental processes is derived from the individual prehistoric period and which portion from the phylogenetic one? It is not, I believe, impossible that we shall. It seems to me, for instance, that symbolic connections, which the individual has never acquired by learning, may justly claim to be regarded as a phylogenetic heritage.

This, however, is not the only archaic characteristic of dreams. You are all familiar, of course, from your own experience, with the remarkable amnesia of childhood. I mean the fact that the earliest years of life, up to the age of five, six or eight, have not left behind them traces in our memory like later experiences. Here and there, it is true, we come upon people who can boast of a continuous memory from the first beginnings to the present day; but the other alternative, of gaps in the memory, is by far the more frequent. There has not, in my opinion, been enough astonishment over this fact. By the time a child is two he can speak well, and soon shows that he is at home in complicated mental situations; and he makes remarks which, if they are reported to him many years later, he himself will have forgotten. Moreover, the memory is more efficient at an early age, since it is less overburdened than it is later. Nor is there any reason for regarding the function of memory as a particularly high or difficult mental activity; on the contrary, we can find a good memory in people of very low intellectual standing.

A second remarkable fact to which I must draw your attention, and which comes on top of the first one, is that out of the void of memories that covers the earliest years of childhood there stand out a few well-preserved recollections, mostly perceived in plastic form, which cannot justify their survival. Our memory deals with the material of the impressions which impinge on us in later life by making a selection among them. It retains what is of any importance and drops what is unimportant. But this is not true of the childhood memories that have been retained. They do not necessarily correspond to the important experiences of childhood years, nor even to those which must have seemed important from the child's point of view. They are often so commonplace and insignificant that we can only ask ourselves in astonishment why this particular detail has escaped oblivion. I attempted long ago, with the help of analysis, to attack the enigma of childhood amnesia and of the residual memories which interrupt it, and I arrived at the conclusion that even in the case of children it is true in spite of everything that only what is important remains in the memory. But through the processes, already familiar to you, of condensation and more especially of displacement, what is important is replaced in memory by something else which appears unimportant. For this reason I have called these childhood memories 'screen memories', and with a thorough analysis everything that has been forgotten can be extracted from them.

In psycho-analytic treatments we are invariably faced by the task of filling up these gaps in the memory of childhood; and in so far as the treatment is to any extent successful - that is to say, extremely frequently - we also succeed in bringing to light the content of these forgotten years of childhood. Those impressions had never been really forgotten, they were only inaccessible, latent, and had formed part of the unconscious. But it can come about that they emerge from the unconscious spontaneously, and this happens in connection with dreams. It appears that dream-life knows how to find access to these latent, infantile experiences. Excellent examples of this have been reported in the literature and I myself have been able to provide a contribution of the kind. I once dreamt in a certain connection of a person who must have done me a service and whom I saw clearly be fore me. He was a one-eyed man of small stature, stout, and with his head sunk deep in his shoulders. I concluded from the context that he was a doctor. Luckily I was able to enquire from my mother, who was still alive, what the doctor at my birth-place (which I had left when I was three) had looked like; and I learnt from her that he was one-eyed, short, stout and with his head sunk deep in his shoulders; and I also learnt what the accident was for which he had come to my help and which I myself had forgotten. This fact of dreams having at their disposal the forgotten material of the first years of childhood is thus a further archaic feature.

This same piece of information can be further applied to another of the riddles we have come up against. You recall the amazement which was caused by our discovery that what instigates dreams are actively evil and extravagantly sexual wishes, which have made the censorship and distortion of dreams necessary. When we have interpreted a dream of this sort to the dreamer and if, to take the most favourable case, he does not actually attack the interpretation, he nevertheless regularly raises the question of where these wishes come from, since they feel alien to him and their opposite is what he is conscious of. We need have no hesitation in pointing out their origin. These evil wishful impulses arise from the past, and often from a past that is not very remote. It can be shown that there was a time when they were familiar and conscious, even if they are no longer so to-day. A woman, whose dream meant that she would like to see her only daughter, now seventeen years old, dead before her eyes, found under our guidance that she had indeed at one time harboured this death wish. The child was the fruit of an unhappy marriage which was soon dissolved. Once, while she still bore her daughter in her womb, in a fit of rage after a violent scene with her husband she had beaten with her fists on her body in order to kill the child inside it. How many mothers, who love their children tenderly, perhaps over-tenderly, to-day, conceived them unwillingly and wished at that time that the living thing within them might not develop further! They may even have expressed that wish in various, fortunately harmless, actions. Thus their death-wish against someone they love, which is later so mysterious, originates from the earliest days of their relationship to that person.

In the same way, a father had a dream which justified the interpretation that he wished for the death of his favourite eldest child. He too was led to remember that there had been a time when this wish was not strange to him. When the child was still an infant in arms, the father, discontented with his choice of a wife, often thought that if the little creature, who meant nothing to him, were to die, he would be free once more and would make better use of his freedom. The same origin can be shown in the case of a great number of similar impulses of hatred; they are recollections of something belonging to the past, which was once conscious and played its part in mental life. You will be inclined to conclude from this that such wishes and such dreams ought not to arise in cases where transformations of this kind in one's relation to someone never occurred, where the relation was of the same kind from the first. I am prepared to admit this; but I must remind you that what you must take into consideration is not the *wording* of the dream but its sense after it has been interpreted. It is possible that a manifest dream of the death of someone loved has merely assumed a horrifying mask and may mean something quite different, or that the loved person is intended as a misleading substitute for someone else.

But the same subject will suggest another and far more serious question. 'Even if,' you will say, 'this death-wish was present at one time and is confirmed by recollection, that is still no explanation. After all, it was superseded long ago, and can only be present to-day in the unconscious as no more than an unemotional memory, not as a powerful impulse. Nothing speaks in favour of this last possibility. Why, then, was it recollected at all in the dream?' This question may justly be raised. An attempt to answer it would lead us too far and would necessitate our taking up a position on one of the most important points in the theory of dreams. But I am obliged to keep within the framework of our discussions and to exercise restraint. So prepare yourselves for a provisional renunciation. Let us content ourselves with the factual evidence that this superseded wish can be shown to be the instigator of the dream, and let us pursue our enquiry whether other evil wishes can be similarly traced back to the past.

We will keep to wishes forgetting rid of someone, which may for the most part be attributed to the dreamer's unrestricted egoism. A wish of this kind can very often be pointed to as the constructor of a dream. Whenever anyone in the course of one's life gets in one's way - and how often this must happen in view of the complication of one's relationships in life! - a dream is promptly ready to kill that person, even if it be father or mother, brother or sister, husband or wife. This wickedness of human nature came as a great surprise to us and we were decidedly disinclined to accept this outcome of dream-interpretation without question. But as soon as we were led to look for the origin of these wishes in the past, we discovered the period of the individual's past in which there was no longer anything strange in such egoism and such wishful impulses, directed even against his closest relatives. It is children, and precisely in those earliest years which are later veiled by amnesia, who often exhibit this egoism to an extremely marked degree and who invariably show clear rudiments or, more correctly speaking, residues of it. Children love themselves first, and it is only later that they learn to love others and to sacrifice something of their own ego to others. Even those people whom a child seems to love from the beginning are loved by him at first because he needs them and cannot do without them - once again from egoistic motives. Not until later does the impulse to love make itself independent of egoism. It is literally true that *his egoism has taught him to love*.

In this connection it will be interesting to compare the child's attitude to his brothers and sisters with that towards his parents. A small child does not necessarily love his brothers and sisters; often he obviously does not. There is no doubt that he hates them as his competitors, and it is a familiar fact that this attitude often persists for long years, till maturity is reached or even later, without interruption. Quite often, it is true, it is succeeded, or let us rather say overlaid, by a more affectionate attitude; but the hostile one seems very generally to be the earlier. This hostile attitude can be observed most easily in children between two and a half and four or five, when a new baby brother or sister appears. It usually meets with a very unfriendly reception. Such remarks as 'I don't like him; the stork can take him away again!' are quite common. After this, every opportunity is taken of disparaging the new arrival and attempts to injure him and even murderous assaults are not unknown. If the difference in age is less, by the time the child's mental activity has awakened to some degree of intensity he finds his competitor already there and adjusts himself to him. If the difference is greater, the new baby may from the first arouse a certain sympathy as an interesting object, a sort of live doll; and where the difference in age is of eight or more years, solicitous, maternal impulses may already come into play, especially in girls. But, honestly speaking, if one comes upon a wish for the death of a brother or sister behind a dream, there is seldom need to find it puzzling and one can trace its prototype without any trouble in early childhood and often enough in later years of companionship as well.

There is probably no nursery without violent conflicts between its inmates. The motives for these are rivalry for parental love, for common possessions, for living space. The hostile impulses are directed against older as well as against younger members of the family. It was, I believe, Bernard Shaw who remarked: 'As a rule there is only one person an English girl hates more than she hates her mother; and that's her eldest sister.' But there is something in this remark that strikes us as strange. We might at a pinch find hatred and competition with brothers and sisters intelligible. But how can we suppose that feelings of hatred can make their way into the relation between daughter and mother, between parents and children?

This relation is undoubtedly a more favourable one, from the children's point of view as well. That is what our expectations demand; we find an absence of love far more repellent between parents and children than between brothers and sisters. In the former case we have, as it were, made something sacred which in the latter we have left profane. Yet daily observation can show us how frequently the emotional relations between parents and their grown-up children fall behind the ideal set up by society, how much hostility is ready to hand and would be expressed if it were not held back by admixtures of filial piety and affectionate impulses. The motives for this hostility are generally known and their tendency is to divide those of the same sex - the daughter from the mother and the father from the son. The daughter finds in her mother the authority which restricts her will and which is entrusted with the task of imposing on her the renunciation of sexual freedom which society demands; in a few instances she even finds in her a competitor who struggles against being supplanted. The same thing is repeated between the son and his father still more glaringly. In the son's eyes his father embodies every unwillingly tolerated social restraint; his father prevents him from exercising his will, from early sexual pleasure and, where there is common property in the family, from enjoying it. In the case of an heir to the throne this waiting for a father's death reaches an almost tragic height. There seems less danger to the relation between father and daughter or mother and son. This last provides the purest examples of an unchangeable affection, unimpaired by any egoistic considerations.

Why am I speaking of these things, which are after all commonplaces and universally known? Because there is an unmistakable inclination to disavow their importance in life and to make out that the ideal demanded by society is fulfilled far more often than it really is. It is better, however, that the truth should be told by psychologists rather than that the task should be left to cynics. And, incidentally, this disavowal applies only to real life. Narrative and dramatic works of the imagination may freely make play with the themes that arise from a disturbance of this ideal.

There is no need to feel surprised, therefore, if, in a large number of people, dreams disclose their wish to get rid of their parents and especially of the parent of their own sex. We may assume that this wish is also present in waking life and is even conscious sometimes, if it can be masked by some other motive, as was the case with our dreamer in Example 3, where it was replaced by pity for his father's useless sufferings. It is rarely that the hostility alone dominates the relationship; far oftener it is in the background of more affectionate impulses by which it is suppressed, and it must wait until a dream isolates it, as it were. What seems to us of enormous size in a dream, on account of this isolation, shrinks up once more when our interpretation has given it its place in the context of real life (Hanns Sachs). But we come upon this dream-wish, too, where it has no relevance in real life, and where the adult need never confess to it in his waking life. The reason for this is that the deepest and most invariable motive for estrangement, especially between two people of the same sex, has already made itself felt in early childhood.

What I have in mind is rivalry in love, with a clear emphasis on the subject's sex. While he is still a small child, a son will already begin to develop a special affection for his mother, whom he regards as belonging to him; he begins to feel his father as a rival who disputes his sole possession. And in the same way a little girl looks on her mother as a person who interferes with her affectionate relation to her father and who occupies a position which she herself could very well fill. Observation shows us to what early years these attitudes go back. We refer to them as the 'Oedipus complex', because the legend of Oedipus realizes, with only a slight softening, the two extreme wishes that arise from the son's situation - to kill his father and take his mother to wife. I do not wish to assert that the Oedipus complex exhausts the relation of children to their parents: it can easily be far more complicated. The Oedipus complex can, moreover, be developed to a greater or less strength, it can even be reversed; but it is a regular and very important factor in a child's mental life, and there is more danger of our under estimating rather than over-estimating its influence and that of the developments which proceed from it. Incidentally, children often react in their Oedipus attitude to a stimulus coming from their parents, who are frequently led in their preferences by difference of sex, so that the father will choose his daughter and the mother her son as a favourite, or, in case of a cooling-off in the marriage, as a substitute for a love-object that has lost its value.

It cannot be said that the world has shown much gratitude to psycho-analytic research for its revelation of the Oedipus complex. On the contrary, the discovery has provoked the most violent opposition among adults; and those who had neglected to take part in the repudiation of this proscribed and tabooed emotional relationship made up for their fault later by depriving the complex of its value through twisted re-interpretations. It is my unaltered conviction that there is nothing in this to be disavowed or glossed over. We must reconcile ourselves to the fact which was recognized by the Greek legend itself as an inevitable fate. It is once again an interesting fact that the Oedipus complex, which has been rejected from real life, has been left to imaginative writing, has been placed freely, as it were, at its disposal. Otto Rank has shown in a careful study how the Oedipus complex has provided dramatic authors with a wealth of themes in endless modifications, softenings and disguises - in distortions, that is to say, of the kind which we are already familiar with as the work of a censorship. We may therefore also ascribe this Oedipus complex to dreamers who have been fortunate enough to escape conflicts with their parents in later life. And, intimately linked with it, we find what we call the 'castration complex', the reaction to the threats against the child aimed at putting a stop to his early sexual activities and attributed to his father.

What we have already learnt from our study of the mental life of children will lead us to expect to find a similar explanation of the other group of forbidden dream-wishes - the excessive sexual impulses. We are thus encouraged to make a study of the development of children's sexual life and from many sources we arrive at what follows.

First and foremost, it is an untenable error to deny that children have a sexual life and to suppose that sexuality only begins at puberty with the maturation of the genitals. On the contrary, from the very first children have a copious sexual life, which differs at many points from what is later regarded as normal. What in adult life is described as 'perverse' differs from the normal in these respects: first, by disregarding the barrier of species (the gulf between men and animals), secondly, by overstepping the barrier against disgust, thirdly that against incest (the prohibition against seeking sexual satisfaction from near blood-relations), fourthly that against members of one's own sex and fifthly the transferring of the part played by the genitals to other organs and areas of the body. None of these barriers existed from the beginning; they were only gradually erected in the course of development and education. Small children are free from them. They recognize no frightful gulf between human beings and animals; the arrogance with which men separate themselves from animals does not emerge until later. To begin with, children exhibit no disgust at excreta but acquire this slowly under the pressure of education; they attach no special importance to the distinction between the sexes, but attribute the same conformation of the genitals to both; they direct their first sexual lusts and their curiosity to those who are nearest and for other reasons dearest to them - parents, brothers and sisters, or nurses; and finally, they show (what later on breaks through once again at the climax of a love-relation) that they expect to derive pleasure not only from their sexual organs, but that many other parts of the body lay claim to the same sensitivity, afford them analogous feelings of pleasure and can accordingly play the part of genitals. Children may thus be described as 'polymorphously perverse', and if these impulses only show *traces* of activity, that is because on the one hand they are of less intensity compared with those in later life and on the other hand all a child's sexual manifestations are at once energetically suppressed by education. This suppression is, as it were, extended into theory; for adults endeavour to overlook one portion of the sexual manifestations of children and to disguise another portion by misinterpreting its sexual nature, so that they can then disavow the whole of them. It is often the very same people who in the nursery are furious with any sexual naughtinesses of children and afterwards at their writing-tables defend the sexual purity of the same children. When children are left to themselves, or under the influence of seduction, they often bring about quite considerable achievements in the way of perverse sexual activity. Adults are of course right not to take this too seriously and to regard it as 'childishness', or 'playfulness', for children are not to be condemned as fully capable or fully responsible either before the judgement-seat of morals or before the law; but nonetheless these things exist. They have their importance both as indications of a child's innate constitution and as causes and encouragements of later developments in him; they give us information on the sexual life of children and so on human sexual life in general. If, therefore, we once more find all these perverse wishful impulses behind our distorted dreams, that only means that in this field too dreams have taken a step backwards into the state of infancy.

Among these forbidden wishes special emphasis deserves to be further laid on the incestuous ones - that is, on those aiming at sexual intercourse with parents and brothers and sisters. You know what horror is felt, or at least professed, in human society at such intercourse, and what stress is laid on the prohibitions directed against it. Tremendous efforts have been made to explain this horror of incest. Some people have supposed that breeding considerations on the part of Nature have found psychical representation in this prohibition, since inbreeding would impair racial characters. Others have maintained that, as a result of living together from early childhood onwards, sexual desire has been diverted from the people in question. In both these cases, it may be remarked, an avoidance of incest would be secured automatically, and it would not be clear why such severe prohibitions were called for, which would point rather to the presence of a strong desire for it. Psycho-analytic researches have shown unmistakably that the choice of an incestuous love-object is, on the contrary, the first and invariable one, and that it is not until later that resistance to it sets in; it is no doubt impossible to trace back this resistance to *individual* psychology.

Let us now bring together what our researches into child psychology have contributed to our understanding of dreams. We have not only found that the material of the forgotten experiences of childhood is accessible to dreams, but we have also seen that the mental life of children with all its characteristics, its egoism, its incestuous choice of love-objects, and so on, still persists in dreams - that is, in the unconscious, and that dreams carry us back every night to this infantile level. The fact is thus confirmed that *what is unconscious in mental life is also what is infantile*. The strange impression of there being so much evil in people begins to diminish. This frightful evil is simply the initial, primitive, infantile part of mental life, which we can find in actual operation in children, but which, in part, we overlook in them on account of their small size, and which in part we do not take seriously since we do not expect any high ethical standard from children. Since dreams regress to this level, they give the appearance of having brought to light the evil in us. But this is a deceptive appearance, by which we have allowed ourselves to be scared. We are not so evil as we were inclined to suppose from the interpretation of dreams.

If these evil impulses in dreams are merely infantile phenomena, a return to the beginnings of our ethical development (since dreams simply make us into children once more in our thoughts and feelings), we need not, if we are reasonable, be ashamed of these evil dreams. But what is reasonable is only a *part* of mental life, a number of other things take place in the mind which are not sensible; and so it happens that we *are* ashamed of these dreams in an unreasonable way. We subject them to the dream-censorship, we are ashamed and angry if, as an exception, one of these wishes succeeds in making its way into consciousness in such an undistorted form that we are obliged to recognize it; indeed we are occasionally as ashamed of a *distorted* dream as if we understood it. Only think of the indignant judgement which the excellent elderly lady passed on her uninterpreted dream of the 'love services'. So the problem is not yet cleared up, and it is still possible that further consideration of the evil in dreams may lead us to form another judgement and arrive at another estimate of human nature.

As the outcome of our whole enquiry, let us grasp two discoveries, though they only signify the beginning of fresh enigmas and fresh doubts. First, the regression of the dream-work is not only a formal but also a material one. It not only translates our thoughts into a primitive form of expression; but it also revives the characteristics of our primitive mental life - the old dominance of the ego, the initial impulses of our sexual life, and even, indeed, our old intellectual endowment, if symbolic connections may be regarded as such. And secondly, all this, which is old and infantile and was once dominant and alone dominant, must to-day be ascribed to the unconscious, our ideas of which are now becoming altered and extended. 'Unconscious' is no longer the name of what is latent at the moment; the unconscious is a particular realm of the mind with its own wishful impulses, its own mode of expression and its peculiar mental mechanisms which are not in force elsewhere. But the latent dream-thoughts which we have discovered by interpreting dreams do not belong to this realm; they are on the contrary thoughts just as we might have thought them in waking life. Nevertheless, they are unconscious. How, then, is this contradiction to be solved? We begin to suspect that a distinction is to be drawn here. Something which is derived from our conscious life and shares its characteristics - we call it 'the day's residues' - combines with something else coming from the realm of the unconscious in order to construct a dream. The dream-work is accomplished between these two components. The influence exercised upon the day's residues by the addition of the unconscious is no doubt among the determinants of regression. This is the deepest insight that we can reach here into the essential nature of dreams - until we have investigated further regions of the mind. But the time will soon have come to provide another name for the unconscious character of the latent dream-thoughts in order to distinguish it from the unconscious which comes from the realm of the infantile.

We can, of course, raise another question besides: 'What is it that forces psychical activity during sleep to make this regression? Why does it not dispose of the mental stimuli that disturb sleep without doing this? And if, for the purposes of the dream censorship, it has to make use of disguise by means of the old and now unintelligible mode of expression, what is the point of reviving as well the old mental impulses, wishes and character traits, which are superseded to-day - of making use of material regression in addition to the formal kind?' The only answer that could satisfy us would be that in this way alone can a dream be constructed, that it is not otherwise dynamically possible to get rid of the stimulus to the dream. But so far we have no right to give such an answer.

LECTURE XIV

WISH-FULFILMENT

LADIES AND GENTLEMEN, - Shall I remind you once more of the ground we have covered so far? Of how, when we began applying our technique, we came up against the distortion in dreams, of how we thought we would begin by evading it and obtained our first decisive information on the essential nature of dreams from the dreams of children? Of how, after that, armed with what we had learnt from that enquiry, we made a direct assault on dream-distortion and, as I hope, overcame it step by step? We are bound to admit, however, that the things we have discovered by the one path and by the other do not entirely correspond. It will be our task to piece the two sets of findings together and reconcile them with each other.

We found from both sources that the dream-work consists essentially in the transformation of thoughts into a hallucinatory experience. How this can happen is sufficiently mysterious; but it is a problem of general psychology with which we are not properly concerned here. We learnt from children's dreams that it is the intention of the dream-work to get rid of a mental stimulus, which is disturbing sleep, by means of the fulfilment of a wish. We were unable to say anything similar of distorted dreams till we found out how to interpret them. But it was from the first our expectation that we should be able to regard distorted dreams in the same light as those of children. The first confirmation of this expectation was brought to us by the discovery that in point of fact *all* dreams are children's dreams, that they work with the same infantile material, with the mental impulses and mechanisms of childhood. Now that we believe we have overcome dream-distortion, we must go on to enquire whether the view of dreams as the fulfilment of wishes is also valid of distorted dreams.

A short time ago we submitted a series of dreams to interpretation, but we left wish-fulfilment completely out of account. I feel sure that you must have repeatedly been driven to ask yourselves: 'But where is the wish-fulfilment, which is supposed to be the aim of the dream-work?' The question is an important one, for it has become the question raised by our lay critics. Human beings, as you know, have an instinctive tendency to fend off intellectual novelties. One of the ways in which this tendency is manifested is by immediately reducing the novelty to the smallest proportions, by compressing it if possible into a single catch-word. 'Wish-fulfilment' has become the catch word for the new theory of dreams. The layman asks: 'Where is the wish-fulfilment?' And instantly, having heard that dreams are supposed to be wish-fulfilments, and in the very act of asking the question, he answers it with a rejection. He immediately thinks of countless experiences of his own with dreams, in which the dream has been accompanied by feelings ranging from the unpleasurable to severe anxiety, so that the assertion made by the psycho-analytic theory of dreams seems to him most improbable. We have no difficulty in replying that in distorted dreams the wish-fulfilment cannot be obvious but must be looked for, so that it cannot be pointed out until the dream has been interpreted. We know too that the wishes in these distorted dreams are forbidden ones - rejected by the censorship - whose existence was precisely the cause of the dream's distortion, the reason for the intervention of the dream censorship. But it is difficult to make the lay critic understand that before a dream has been interpreted one cannot enquire about the fulfilment of its wish. He will keep on forgetting this. His rejection of the theory of wish-fulfilment is actually nothing other than a consequence of the dream-censorship, a substitute for the rejection of the censored dream-wishes and an effluence from it.

We too, of course, feel the need to explain to ourselves why there are so many dreams with a distressing content and, especially why there are anxiety-dreams. Here for the first time we come upon the problem of affects in dreams; it would deserve a monograph of its own, but unfortunately we cannot enter into it. If dreams are the fulfilment of wishes, distressing feelings should be impossible in them: the lay critics would appear to be right there. But three kinds of complications must be taken into account which they have not thought of.

Firstly, it may be that the dream-work has not completely succeeded in creating a wish-fulfilment; so that a portion of the distressing affect in the dream-thoughts has been left over in the manifest dream. In that case analysis would have to show that these dream-thoughts were far more distressing than the dream-constructed out of them. That much can always be proved. If so, we must admit that the dream-work has not achieved its aim any more than the dream of drinking, formed in response to the stimulus of thirst, succeeded in quenching the thirst. The dreamer remains thirsty and has to wake up in order to drink. Nevertheless it was a genuine dream, and had lost nothing of a dream's essential nature. We can only say: 'Ut desint vires, tamen est laudanda voluntas.'¹ The intention, at least, which can clearly be recognized, remains praiseworthy. Such instances of failure are no rare event. This is helped by that fact that it is so much harder for the dream-work to alter the sense of a dream's *affects* than of its *content*; affects are some times highly resistant. What then happens is that the dream-work transforms the distressing content of the dream-thoughts into the fulfilment of a wish, while the distressing affect persists unaltered. In dreams of this kind the affect is quite inappropriate to the content, and our critics can say that dreams are so far from being wish-fulfilments that even one with a harmless content can be felt as distressing. We can answer this foolish remark by pointing out that it is precisely in dreams like this that the wish-fulfilling purpose of the dream-work appears most clearly, because in isolation. The error arises because those who are unfamiliar with the neuroses picture the link between content and affect as too intimate and therefore cannot imagine the content being altered without a simultaneous alteration of the expression of affect attached to it.

¹ ['Though the strength is lacking, the will deserves to be praised.']

A second factor, which is much more important and far reaching, but which is equally overlooked by laymen, is the following. No doubt a wish-fulfilment must bring pleasure; but the question then arises 'To whom?' To the person who has the wish, of course. But, as we know, a dreamer's relation to his wishes is a quite peculiar one. He repudiates them and censors them - he has no liking for them, in short. So that their fulfilment will give him no pleasure, but just the opposite; and experience shows that this opposite appears in the form of anxiety, a fact which has still to be explained. Thus a dreamer in his relation to his dream-wishes can only be compared to an amalgamation of two separate people who are linked by some strong element in common. Instead of enlarging on this, I will remind you of a familiar fairy tale in which you will find the same situation repeated. A good fairy promised a poor married couple to grant them the fulfilment of their first three wishes. They were delighted, and made up their minds to choose their three wishes carefully. But a smell of sausages being fried in the cottage next door tempted the woman to wish for a couple of them. They were there in a flash; and this was the first wish-fulfilment. But the man was furious, and in his rage wished that the sausages were hanging on his wife's nose. This happened too; and the sausages were not to be dislodged from their new position. This was the second wish-fulfilment; but the wish was the man's, and its fulfilment was most disagreeable for his wife. You know the rest of the story. Since after all they were in fact one - man and wife - the third wish was bound to be that the sausages should come away from the woman's nose. This fairy tale might be used in many other connections; but here it serves only to illustrate the possibility that if two people are not at one with each other the fulfilment of a wish of one of them may bring nothing but unpleasure to the other.

It will not be difficult for us now to reach a still better understanding of anxiety-dreams. We will bring up one more observation and then make up our minds to adopt a hypothesis in favour of which there is much to be said. The observation is that anxiety-dreams often have a content entirely devoid of distortion, a content which has, so to speak, evaded the censorship. An anxiety-dream is often the undisguised fulfilment of a wish - not, of course, of an acceptable wish, but of a repudiated one. The generation of anxiety has taken the place of the censorship. Whereas we can say of an infantile dream that it is the open fulfilment of a permitted wish, and of an ordinary distorted dream that it is the disguised fulfilment of a repressed wish, the only formula which fits an anxiety-dream is that it is the open fulfilment of a repressed wish. The anxiety is a sign that the repressed wish has shown itself stronger than the censorship, that it has put through, or is on the point of putting through, its wish-fulfilment in spite of the censorship. We perceive that what is for it a wish-fulfilment can only be for us, who are on the side of the censorship, an occasion for distressing feelings and for fending the wish off. The anxiety that emerges in the dream is, if you like, anxiety at the strength of these wishes which are normally held down. Why this fending-off appears in the form of anxiety cannot be discovered from the study of dreams alone; anxiety must clearly be studied elsewhere.

We may suppose that what is true of undistorted anxiety dreams applies also to those which are partly distorted as well as to other unpleasurable dreams, in which the distressing feelings probably correspond to an approach to anxiety. Anxiety-dreams are as a rule also arousal dreams; we usually interrupt our sleep before the repressed wish in the dream has put its fulfilment through completely in spite of the censorship. In that case the function of the dream has failed, but its essential nature is not altered by this. We have compared dreams to the night-watchman or guardian of sleep, who tries to protect our sleep from disturbance. The night-watchman, too, may reach the point of waking the sleeper if he feels he is too weak alone to drive off the disturbance or the danger. Nevertheless we sometimes succeed in holding on to our sleep even when the dream begins to be precarious and to be turning into anxiety. We say to ourselves in our sleep 'after all it's only a dream', and sleep on.

When does it happen that a dream-wish is in a position to overpower the censorship? The condition necessary for this may be fulfilled equally well by the dream-wish or by the dream censorship. The wish may for an unknown reason be excessively strong on some occasion; but one gets an impression that it is more often the behaviour of the dream-censorship that is responsible for this displacement of their relative strengths. We have already seen that the censorship acts with varying intensity in each particular case, that it treats each element of a dream with a different degree of severity. We can now add a further hypothesis to the effect that it is in general very variable and does not always employ equal severity to the same objectionable element. If things turn out so that on some occasion it feels itself powerless against a dream-wish which threatens to take it by surprise, instead of distortion, it makes use of its last remaining expedient and abandons the state of sleep, at the same time generating anxiety.

In this connection it strikes us that we are still quite ignorant of why it is that these evil, repudiated wishes become active precisely at night and disturb us during our sleep. The answer is almost bound to lie in some hypothesis going back to the nature of the state of sleep. In day-time the heavy weight of censorship rests on them and as a rule makes it impossible for them to manifest themselves in any activity. At night this censorship, like all the other interests of mental life, is probably withdrawn, or at least greatly reduced, in favour of the single wish to sleep. It is this lowering of the censorship at night that the forbidden wishes have to thank for being able to become active once more. There are some neurotic patients who are unable to sleep and who admit to us that their insomnia was originally intentional. They did not dare to sleep because they were afraid of their dreams - afraid, that is, of the results of the weakening of the censorship. You will easily see, however, that in spite of this the withdrawal of the censorship implies no gross carelessness. The state of sleep paralyses our motive powers. If our evil intentions begin to stir, they can, after all, do nothing more than precisely cause a dream, which is harmless from the practical point of view. It is this soothing consideration that is the basis of the highly sensible remark made by the sleeper-made at night, it is true, but not forming part of dream-life: 'After all it's only a dream. So let us leave it to take its course, and let us sleep on.'

If, in the third place, you will recall our idea that the dreamer fighting against his own wishes is to be compared with a summation of two separate, though in some way intimately connected, people, you will understand another possibility. For there is a possibility that the fulfilment of a wish may bring about something very far from pleasant - namely, a punishment. Here we can once more use the fairy tale of the three wishes as an illustration. The fried sausages on a plate were the direct fulfilment of the wish of the first person, the woman, The sausages on her nose were the fulfilment of the wish of the second person, the man, but were at the same time a punishment for the woman's foolish wish. (We shall discover in neuroses the motive for the third wish, the last remaining one in the fairy tale.) There are many such punitive trends in the mental life of human beings; they are very powerful, and we may hold them responsible for some of the distressing dreams. Perhaps you will now say that this leaves very little over of the famous wish-fulfilment. But if you look more closely you will admit that you are wrong. Compared with the multiplicity (which I shall mention later) of the things that dreams might be and according to many authorities actually are, our solution - wish-fulfilment, anxiety-fulfilment, punishment-fulfilment - is a very restricted one. We may add that the anxiety is the direct opposite of the wish, that opposites are especially close to one another in associations and that in the unconscious they coalesce; and further, that the punishment is also the fulfilment of a wish - of the wish of the other, censoring person.

On the whole, therefore, I have made no concession to your objection to the theory of wish-fulfilment. It is our duty, however, to be able to indicate the wish-fulfilment in any distorted dream we may come across, and we shall certainly not evade the task. Let us go back to the dream we have already interpreted of the three bad theatre-tickets for 1 florin 50, from which we have already learnt so much. I hope you still recollect it. A lady, whose husband had told her during the day that her friend Elise, who was only three months her junior, had become engaged, dreamt that she was at the theatre with her husband. One side of the stalls was almost empty. Her husband said to her that Elise and her fiancé had wanted to go to the theatre too but had not been able to, since they had only got bad seats - three for 1 florin 50. She thought it would not really have done any harm if they had. We found that the dream-thoughts related to her anger at having married so early and to her dissatisfaction with her husband. We may be curious to discover how these gloomy thoughts were transformed into the fulfilment of a wish and where any trace of it is to be found in the manifest content of the dream. We already know that the element 'too early, in a hurry' was eliminated from the dream by the censorship. The empty stalls were an allusion to it. The mysterious 'three for 1 florin 50' now becomes more intelligible to us with the help of the symbolism with which we have meanwhile become acquainted. The '3' really means a man and the manifest element is easy to translate: buying a husband with her dowry. ('I could have got one ten times better with my dowry.') 'Marrying' is clearly replaced by 'going to the theatre'. 'Taking the theatre tickets too early' is, indeed, an immediate substitute for 'marrying too early'. This substitution is, however, the work of a wish-fulfilment. Our dreamer was not always so dissatisfied with her early marriage as she was on the day when she received the news of her friend's engagement. She had been proud of it at one time and regarded herself as at an advantage over her friend. Simple-minded girls, after becoming engaged, are reputed often to express their joy that they will soon be able to go to the theatre, to all the plays which have hitherto been prohibited, and will be allowed to see everything. The pleasure in looking, or curiosity, which is revealed in this was no doubt originally a sexual desire to look, directed towards sexual happenings and especially on to the girls' parents, and hence it became a powerful motive for urging them to an early marriage. In this way a visit to the theatre became an obvious substitute, by way of allusion, for being married. Thus the dreamer, in her present anger at her early marriage, harked back to the time at which early marriage was the fulfilment of a wish because it satisfied her scopophilia, and, under the lead of this old wishful impulse, she replaced marriage by going to the theatre.

¹ I have not mentioned another plausible interpretation of this '3' in a childless woman, since this analysis brought up no material in support of it.

I cannot be accused of having specially chosen out the most convenient example as evidence of a concealed wish-fulfilment. The procedure would have had to be the same in the case of other distorted dreams. I cannot demonstrate this to you now, and I will only express my conviction that it could always be successfully accomplished. I will, however, dwell a little longer on this theoretical point. Experience has taught me that it is one of those most exposed to attack in the whole theory of dreams, and that many contradictions and misunderstandings arise from it. Apart from this, you may perhaps still be under the impression that I have already withdrawn part of my assertion in saying that a dream is a fulfilled wish or the opposite of one, or a realized anxiety or punishment; and you may think this is an opportunity of forcing further qualifications out of me. I have also been reproached for putting forward things that seem to me obvious in a manner that is too concise and consequently unconvincing.

When someone has accompanied us so far in the interpretation of dreams and has accepted everything that has been brought forward up to this point, it often happens that he comes to a halt at wish-fulfilment and says: 'Granted that dreams always have a sense, and that that sense can be discovered by the technique of psycho-analysis, why must that sense, all evidence to the contrary, be invariably pushed into the formula of wish-fulfilment? Why should not the sense of this nightly thinking be of as many kinds as that of daytime thinking? Why, that is, should not a dream correspond sometimes to a fulfilled wish, sometimes, as you yourself say, to the opposite of that or to a realized fear, but sometimes express an intention, a warning, a reflection with its "pros" and "cons", or a reproach, a scruple of conscience, an attempt at preparing for a coming task, and so on? Why must it always be only a wish, or at most its opposite?'

It might be thought that a difference of opinion on this point is unimportant, if one is agreed on the rest. It is enough, it might be said, that we have discovered the sense of dreams and the way of recognizing it; it is of less importance if we seem to have defined that sense too narrowly. But that is not so. A misunderstanding on this point affects the essence of our discoveries about dreams and endangers their value for the understanding of the neuroses. Moreover, a compromise of this sort - what is highly thought of in commercial life as being 'accommodating' - is not in place, but detrimental rather, in scientific affairs.

My first answer to the question why dreams should not have a variety of meanings in the sense indicated is as usual in such cases: 'I don't know why they shouldn't. I should have no objection. As far as I'm concerned it could be so. There's only one detail in the way of this broader and more convenient view of dreams - that it isn't so in reality.' My second answer would be that the hypothesis that dreams correspond to a variety of forms of thinking and intellectual operations is not unfamiliar to me myself. I once reported a dream in one of my case histories which appeared on three nights in succession and then no more, and I explained this behaviour by the fact that the dream corresponded to an *intention*, and did not need to be repeated after the intention had been carried out. Later on I published a dream which corresponded to an *admission*. How, then, can I contradict myself and assert that dreams are never anything but a fulfilled wish?

I do it because I will not allow a foolish misunderstanding to pass which may rob us of the fruit of our efforts with dreams - a misunderstanding which confuses the dream with the latent dream-thoughts, and asserts of the former something that applies solely to the latter. For it is quite correct to say that a dream can represent and be replaced by everything you have just enumerated - an intention, a warning, a reflection, a preparation, an attempt at solving a problem, and so on. But if you look properly, you will see that all this only applies to the latent dream-thoughts, which have been transformed into the dream. You learn from interpretations of dreams that people's unconscious thinking is concerned with these intentions, preparations, reflections, and so on, out of which the dream-work then makes the dreams. If at the moment you are not interested in the dream-work, but are greatly interested in people's unconscious thought-activity, you then eliminate the dream-work and say of the dream what is in practice quite correct that it corresponds to a warning, an intention, and so on. what often happens in psycho-analytic activity is that our efforts are chiefly directed only to doing away with the dream-form and inserting in the context instead of it the latent thoughts out of which the dream was made.

Thus, quite incidentally, we learn from our examination of the latent dream-thoughts that all these highly complicated mental acts that we have named can take place unconsciously - a discovery as imposing as it is perplexing!

But to go back, you are only correct so long as you are clearly aware that you have used an abbreviated form of expression and so long as you do not believe that the multiplicity you have been describing is to be related to the essential nature of dreams. When you speak of a 'dream', you must mean either the manifest dream - that is, the product of the dream-work or, at most, the dream-work itself as well - that is, the psychical process which forms the manifest dream out of the latent dream-thoughts. Any other use of the word is a confusion of ideas and can only lead to mischief. If you are making statements about the latent thoughts behind the dream, do so directly and do not obscure the problem of dreams by the loose manner in which you speak. The latent dream-thoughts are the material which the dream-work transforms into the manifest dream. Why should you want to confuse the material with the activity which forms it? If you do, what advantage have you over those who only knew the product of the activity and could not explain where it came from or how it was made?

The only essential thing about dreams is the dream-work that has influenced the thought-material. We have no right to ignore it in our theory, even though we may disregard it in certain practical situations. Analytic observation shows further that the dream-work never restricts itself to translating these thoughts into the archaic or regressive mode of expression that is familiar to you. In addition, it regularly takes possession of something else, which is not part of the latent thoughts of the previous day, but which is the true motive force for the construction of the dream. This indispensable addition is the equally unconscious wish for the fulfilment of which the content of the dream is given its new form. A dream may thus be any sort of thing in so far as you are only taking into account the thoughts it represents - a warning, an intention, a preparation, and so on; but it is always also the fulfilment of an unconscious wish and, if you are considering it as a product of the dream-work, it is only that. A dream is therefore never simply an intention, or a warning, but always an intention, etc., translated into the archaic mode of thought by the help of an unconscious wish and transformed to fulfil that wish. The one characteristic, the wish-fulfilment, is the invariable one; the other may vary. It may for its part once more be a wish, in which case the dream will, with the help of an unconscious wish, represent as fulfilled a latent wish of the previous day.

I can understand all this very clearly; but I cannot tell whether I have succeeded in making it intelligible to you as well. And I also have difficulty in proving it to you. That cannot be done without carefully analysing a great many dreams, and on the other hand this most critical and important point in our view of dreams cannot be convincingly represented without referring to what is coming later. It is impossible to suppose that, since everything is intimately interrelated, one can penetrate deeply into the nature of one thing without having concerned oneself with other things of a similar nature. Since we still know nothing of the dream's nearest relatives, neurotic symptoms, we must once more rest content at this point with what we have achieved. I will only give you one more illustrative example and lay before you one fresh consideration.

Let us once again take up the dream we have already so often returned to: the dream of the three theatre-tickets for 1 florin 50. (I can assure you that I originally chose out this example without any special purpose in view.) You know the latent dream thoughts: anger at having been in such a hurry to get married which arose when she heard the news that her friend had only just become engaged, putting a low value on her husband and the idea that she might have got a better one if only she had waited. We already know the wish which made a dream out of these thoughts: it was the desire to look, to be able to go to the theatre, most probably an offshoot of her old curiosity to discover at long last what really happens when one is married. This curiosity is, as we know, regularly directed by children towards their parents' sexual life; it is an infantile curiosity, and, so far as it still persists later, an instinctual impulse with roots reaching back into infancy. But the news the dreamer had received during the day gave no occasion for awakening this desire to look, but only for awakening anger and regret. This wishful impulse was not in the first instance connected with the latent dream-thoughts; and we were able to include the outcome of the dream-interpretation in the analysis without taking any account of that impulse. But the anger in itself was not capable of creating a dream. A dream could not arise out of the thoughts that 'it was absurd to marry so early' until they had awakened the old wish to see at long last what happens in marriage. This wish then gave the dream-content its form by replacing marriage by going to the theatre, and the form was that of an earlier wish-fulfilment: 'There! now I may go to the theatre and look at everything that's forbidden, and you mayn't! I'm married and you must wait!' In this way the dreamer's present situation was transformed into its opposite, an old triumph was put in the place of her recent defeat. And, incidentally, a satisfaction of her scopophilia was mixed with a satisfaction of her egoistic competitive sense. This satisfaction then determined the manifest content of the dream, in which the position actually was that she was sitting in the theatre while her friend could not gain admission to it. The portions of the content of the dream behind which the latent dream-thoughts still lay concealed were superimposed on this situation of satisfaction as a misplaced and unintelligible modification of it. The dream's interpretation had to disregard everything that served to represent the wish-fulfilment and to re-establish the distressing latent dream-thoughts from these obscure remaining hints.

The fresh consideration I wish to bring before you is to draw your attention to the latent dream-thoughts which have now been put in the foreground. I beg you not to forget that in the first place they are unconscious to the dreamer, and secondly that they are completely rational and coherent so that they can be understood as natural reactions to the precipitating cause of the dream, and thirdly that they can be the equivalent of any mental impulse or intellectual operation. I shall now describe these thoughts more strictly than before as the 'day's residues', whether the dreamer confesses to them or not. I shall now distinguish between the day's residues and the latent dream-thoughts, and, in conformity with our earlier usage, I shall designate as latent dream-thoughts everything we learn in interpreting the dream, whereas the day's residues are only a portion of the latent dream-thoughts. Our view is then that something is added to the day's residues, something that was also part of the unconscious, a powerful but repressed wishful impulse; and it is this alone that makes the construction of the dream possible. The influence of this wishful impulse on the day's residues creates the further portion of the latent dream-thoughts - that which need no longer appear rational and intelligible as being derived from waking life.

I have made use of an analogy for the relation of the day's residues to the unconscious wish, and I can only repeat it here. In every undertaking there must be a capitalist who covers the required outlay and an *entrepreneur* who has the idea and knows how to carry it out. In the construction of dreams, the part of the capitalist is always played by the unconscious wish alone; it provides the psychical energy for the construction of the dream. The *entrepreneur* is the day's residues, which decide how this outlay is to be employed. It is possible, of course, for the capitalist himself to have the idea and the expert knowledge or for the *entrepreneur* himself to possess capital. This simplifies the practical situation but makes its theoretical understanding more difficult. In economics the same person is constantly divided into his two aspects of capitalist and *entrepreneur* and this restores the fundamental situation on which our analogy was based. In dream-construction the same variations occur and I will leave them for you to follow out.

We cannot advance any further here, for you have probably long been disturbed by a doubt which deserves to be given a hearing. 'Are the day's residues,' you will ask, 'really unconscious in the same sense as the unconscious wish which must be added to them in order to make them capable of producing a dream?' Your suspicion is correct. This is the salient point of the whole business. They are *not* unconscious in the same sense. The dream-wish belongs to a different unconscious - to the one which we have already recognized as being of infantile origin and equipped with peculiar mechanisms. It would be highly opportune to distinguish these two kinds of unconscious by different names. But we would prefer to wait till we have become familiar with the field of phenomena of the neuroses. People consider a single unconscious as something fantastic. What will they say when we confess that we cannot make shift without two of them?

Let us break off here. Once again you have only heard something incomplete. But is it not hopeful to reflect that this knowledge has a continuation, which either we ourselves or other people will bring to light? And have not we ourselves learnt enough that is new and surprising?

LECTURE XV

UNCERTAINTIES AND CRITICISMS

LADIES AND GENTLEMEN, - We will nevertheless not leave the field of dreams without dealing with the commonest doubts and uncertainties which our novelties and our theories have given rise to so far. Attentive listeners among you will themselves have collected some of the relevant material.

(1) You may have formed an impression that, even though the technique is correctly carried out, the findings of our interpretative work on dreams admit of so many uncertainties as to defeat any secure translation of the manifest dream into the latent dream-thoughts. You will argue in support of this that in the first place one never knows whether a particular element of the dream is to be understood in its actual sense or as a symbol, since the things employed as symbols do not cease on that account to be themselves. If, however, one has no objective clue for deciding this, the interpretation must at that point be left to the arbitrary choice of the interpreter. Furthermore, as a result of the fact that in the dream-work contraries coalesce, it is always left undetermined whether a particular element is to be understood in a positive or negative sense - as itself or as its contrary. Here is a fresh opportunity for the interpreter to exercise an arbitrary choice. Thirdly, in consequence of the reversals of every kind of which dreams are so fond, it is open to the interpreter to carry out a reversal like this in connection with any passage in the dream he chooses. And lastly, you will mention having heard that one is never certain whether the interpretation one has found for a dream is the only possible one. We run the risk of overlooking a perfectly admissible 'over-interpretation' of the same dream. In these circumstances, you will conclude, so much room is left to the interpreter's arbitrary decision as to be incompatible with objective certainty in the findings. Or alternatively you may suppose that the fault does not lie with dreams but that the inadequacies of our dream-interpretation are to be attributed to errors in our views and premisses.

All your material is unimpeachable, but it does not, I think, justify your conclusions, and in two respects: namely that the interpretation of dreams is, as you insist, at the mercy of arbitrary choice and that the lack of results throws doubts on the correctness of our procedure. If instead of the interpreter's arbitrary choice you would speak of his skill, his experience and his understanding, I should agree with you. We cannot, of course, do without a personal factor of that kind, especially in the more difficult problems of dream-interpretation. But the position is no different in other scientific occupations. There is no means of preventing one person from handling a particular technique worse than another, or one person from making better use of it than another. What in other ways gives an impression of arbitrariness - in, for instance, the interpretation of symbols - is done away with by the fact that as a rule the interconnection between the dream-thoughts, or the connection between the dream and the dreamer's life, or the whole psychical situation in which the dream occurs, selects a single one from among the possible determinations presented and dismisses the rest as unserviceable. The conclusion that because of the imperfections of dream-interpretation our hypotheses are incorrect is invalidated by pointing out that on the contrary ambiguity or indefiniteness is a characteristic of dreams which was necessarily to be anticipated.

Let us recall that we have said that the dream-work makes a translation of the dream-thoughts into a primitive mode of expression similar to picture-writing. All such primitive systems of expression, however, are characterized by indefiniteness and ambiguity of this sort, without justifying us in casting doubts on their serviceability. The coalescence of contraries in the dream-work is, as you know, analogous to the so-called 'antithetical meaning of primal words' in the most ancient languages. Indeed, Abel (1884), the philologist to whom we owe this line of thought, implores us not to suppose that communications made by one person to another with the help of such ambivalent words were on that account ambiguous. On the contrary, intonation and gesture must have made it quite certain in the context of the speech which of the two contraries the speaker intended to convey. In writing, where gesture is absent, its place was taken by an additional pictograph which was not intended to be spoken - for instance by a picture of a little man, limply squatting or stiffly erect, according to whether the ambiguous hieroglyph '*ken*' was to mean 'weak' or 'strong'. In this way, in spite of the ambiguity of the sounds and signs, misunderstanding was avoided.

The old systems of expression - for instance, the scripts of the most ancient languages - betray vagueness in a variety of ways which we would not tolerate in our writing to-day. Thus in some Semitic scripts only the consonants in the words are indicated. The reader has to insert the omitted vowels according to his knowledge and the context. The hieroglyphic script behaves very similarly, though not precisely in the same way; and for that reason the pronunciation of Ancient Egyptian remains unknown to us. The sacred script of the Egyptians is indefinite in yet other ways. For instance, it is left to the arbitrary decision of the scribe whether he arranges the pictures from right to left or from left to right. In order to be able to read it one must obey the rule of reading towards the faces of the figures, birds, and so on. But the scribe might also arrange the pictographs in *vertical* columns, and in making inscriptions on comparatively small objects he allowed considerations of decorativeness and space to influence him in altering the sequence of the signs in yet other ways. The most disturbing thing about the hieroglyphic script is, no doubt, that it makes no separation between words. The pictures are placed across the page at equal distances apart; and in general it is impossible to tell whether a sign is still part of the preceding word or forms the beginning of a new word. In Persian cuneiform script, on the other hand, an oblique wedge serves to separate words.

An extremely ancient language and script, which however is still used by four hundred million people, is the Chinese. You must not suppose that I at all understand it; I only obtained some information about it because I hoped to find analogies in it to the indefiniteness of dreams. Nor has my expectation been disappointed. The Chinese language is full of instances of indefiniteness which might fill us with alarm. As is well known, it consists of a number of syllabic sounds, which are spoken either singly or combined into pairs. One of the principal dialects has some four hundred such sounds. Since, however, the vocabulary of this dialect is reckoned at about four thousand words, it follows that each sound has on an average ten different meanings - some fewer but some correspondingly more. There are quite a number of methods of avoiding ambiguity, since one cannot infer from the context alone which of the ten meanings of the syllabic sound the speaker intends to evoke in the hearer. Among these methods are those of combining two sounds into a compound word and of using four different 'tones' in the pronunciation of the syllables. It is even more interesting from the point of view of our comparison to learn that this language has practically no grammar. It is impossible to tell of any of the monosyllabic words whether it is a noun or a verb or an adjective; and there are no verbal inflections by which one could recognize gender, number, termination, tense or mood. Thus the language consists, one might say, solely of the raw material, just as our thought-language is resolved by the dream-work into its raw material, and any expression of relations is omitted. In Chinese the decision in all cases of indefiniteness is left to the hearer's understanding and this is guided by the context. I have made a note of an example of a Chinese proverb which, literally translated, runs:

'Little what see much what wonderful.'

This is not hard to understand. It may mean: 'The less someone has seen, the more he finds to wonder at'; or: 'There is much to wonder at for him who has seen little.' There is, of course, no question of distinguishing between these two translations, which only differ grammatically. In spite of this indefiniteness, we have been assured that the Chinese language is a quite excellent vehicle for the expression of thought. So indefiniteness need not necessarily lead to ambiguity.

It must, of course, be admitted that the system of expression by dreams occupies a far more unfavourable position than any of these ancient languages and scripts. For after all they are fundamentally intended for communication: that is to say, they are always, by whatever method and with whatever assistance, meant to be understood. But precisely this characteristic is absent in dreams. A dream does not want to say anything to anyone. It is not a vehicle for communication; on the contrary, it is meant to remain understood. For that reason we must not be surprised or at a loss if it turns out that a number of ambiguities and obscurities in dreams remain undecided. The one certain gain we have derived from our comparison is the discovery that these points of uncertainty which people have tried to use as objections to the soundness of our dream-interpretations are on the contrary regular characteristics of all primitive systems of expression.

The question of how far the intelligibility of dreams in fact extends can only be answered by practice and experience. Very far, I believe; and my view is confirmed if we compare the results produced by correctly trained analysts. The lay public, including the scientific lay public, are well known to enjoy making a parade of scepticism when faced by the difficulties and uncertainties of a scientific achievement. I think they are wrong in this. You are perhaps not all aware that a similar situation arose in the history of the deciphering of the Babylonian-Assyrian inscriptions. There was a time when public opinion was very much inclined to regard the decipherers of cuneiform as visionaries and the whole of their researches as a 'swindle'. But in 1857 the Royal Asiatic Society made a decisive experiment. It requested four of the most highly respected experts in cuneiform, Rawlinson, Hincks, Fox Talbot and Oppert, to send it, in sealed envelopes, independent translations of a newly discovered inscription; and, after a comparison between the four productions, it was able to announce that the agreement between these experts went far enough to justify a belief in what had so far been achieved and confidence in further advances. The derision on the part of the learned lay world gradually diminished after this, and since then certainty in reading cuneiform documents has increased enormously.

(2) A second group of doubts is closely connected with the impression, which no doubt you yourselves have not escaped, that a number of the solutions to which we find ourselves driven in interpreting dreams seem to be forced, artificial, dragged in by the hair of their head - arbitrary, that is, or even comic and facetious. Remarks to this effect are so frequent that I will choose at random the last that has been reported to me. So listen to this. In free Switzerland the head of a training college was recently removed from his post on account of his interest in psycho-analysis. He entered a protest, and a Berne newspaper published the report of the school authorities on his appeal. I will select a few sentences dealing with psycho-analysis from this document: 'Moreover we are surprised at the far-fetched and artificial character of many of the examples, which are also to be found in the volume by Dr. Pfister of Zurich which is quoted. . . . It is really surprising, therefore, that the head of a training-college should accept all these assertions and pretended proofs without criticism.' These sentences are represented as a decision reached by someone 'making a calm judgement'. It is rather this calmness, I think, which is 'artificial'. Let us examine these remarks more closely, in the expectation that a little reflection and a little expert knowledge can be of no disadvantage even to a calm judgement.

It is truly refreshing to see how swiftly and unerringly a person can arrive at a judgement on some delicate problem of depth-psychology after his first impression of it. The interpretations seem to him far-fetched and forced and he does not like them; so they are false and all this business of interpretation is worthless. Not even a fleeting thought is given to the other possibility - that there are good reasons why these interpretations are bound to have this appearance; after which the further question would follow of what these good reasons are.

The matter under consideration relates in essence to the results of displacement, which you have become acquainted with as the most powerful instrument of the dream-censorship. With the help of displacement the dream-censorship creates substitutive structures which we have described as allusions. But they are allusions which are not easily recognizable as such, from which the path back to the genuine thing is not easily traced, and which are connected with the genuine thing by the strangest, most unusual, external associations. In all these cases it is a question, however, of things which are *meant* to be hidden, which are condemned to concealment, for that is what the dream-censorship is aiming at. But we must not expect that a thing which has been hidden will be found in its own place, in its proper position. The frontier-control commissions which are operating to-day are more cunning in this respect than the Swiss school authorities. In their search for documents and plans they are not content with examining brief-cases and portfolios, but they consider the possibility that spies and smugglers may have these forbidden things in the most secret portions of their clothing where they decidedly do not belong - for instance, between the double soles of their boots. If the hidden things are there, it will certainly be possible to call them 'far-fetched', but it is also true that a great deal will have been found.

If we recognize that the links between a latent dream-element and its manifest substitute can be of the most out-of-the-way and peculiar nature, sometimes appearing comic and sometimes resembling a joke, we are basing ourselves on copious experience of examples which, as a rule, we have not solved ourselves. It is often impossible to give such interpretations on our own account: no sensible person could guess at the connection. The dreamer gives us the translation either all at once by a direct association - *he* is able to, since it was he who produced the substitute - or else he brings up so much material that the solution no longer calls for any particular acumen, but presents itself, so to speak, as a matter of course. If the dreamer fails to assist in one or other of these two ways, the manifest element in question will for ever remain unintelligible to us. I will, if I may, give you an example which occurred to me recently. One of my women patients lost her father in the course of the treatment. Since then she has taken every opportunity of bringing him to life in her dreams. In one of these her father appeared (in a particular connection of no further relevance) and said: '*It's a quarter past eleven, it's half-past eleven, it's a quarter to twelve.*' By way of interpretation of this oddity all that occurred to her was that her father liked his grown-up children to appear punctually at the family meals. No doubt this was connected with the dream-element, but it threw no light on its origin. There was a suspicion, based on the immediate situation in the treatment, that a carefully suppressed critical revolt against her beloved and honoured father played some part in the dream. In the further course of her associations, apparently remote from the dream, she told how the day before there had been a lot of talk about psychology in her presence, and a relative of hers had remarked: 'The *Urmensch* [primal man] survives in all of us.' This seemed to provide us with the explanation. It had given her an excellent opportunity of bringing her dead father to life once again. She made him in the dream into an '*Uhrmensch*' ['clock-man'] by making him announce the quarter hours at midday.

You will not be able to escape the resemblance of this example to a joke; and it has in fact often happened that a joke of the dreamer's has been regarded as a joke of the interpreter's. There are other instances in which it has been far from easy to decide whether what we are dealing with is a joke or a dream. But you will recall that the same doubt arose in the case of some parapraxes - slips of the tongue. A man reported as a dream of his that his uncle had given him a kiss while they were sitting in his *auto*(mobile). He himself very quickly added the interpretation: it meant '*auto-erotism*' (a term from the theory of the libido, indicating satisfaction obtained without any outside object). Had the man set out, then, to have some fun with us and was he passing off a joke that had occurred to him as a dream? I think not; I believe he really dreamt it. But what is the origin of this puzzling similarity? This question once led me temporarily aside from my path by compelling me to make jokes themselves the subject of a detailed investigation. It was there shown how jokes originate: a preconscious train of thought is abandoned for a moment to be worked over in the unconscious, and from this it emerges as a joke. Under the influence of the unconscious it is subjected to the effects of the mechanisms that hold sway there - condensation and displacement - the same processes that we have found concerned in the dream-work; and it is to this common feature that is to be ascribed the similarity, when it occurs, between jokes and dreams. But the unintended 'dream-joke' brings none of the yield of pleasure of a true joke. You can learn why if you go more deeply into the study of jokes. A 'dream-joke' strikes us as a bad joke; it does not make us laugh, it leaves us cold.

In this, however, we are treading in the footsteps of the dream-interpretation of antiquity, which, along with much that is unserviceable, has left us some good examples of dream-interpretation, which we ourselves could not better. I will repeat to you a dream which was of historic importance and which is reported of Alexander the Great, with slight variations, by Plutarch and Artemidorus of Daldis. When the king was laying siege to the obstinately defended city of Tyre (322 B.C.), he once dreamt that he saw a dancing satyr. Aristander, the dream-interpreter, who was present with the army, interpreted the dream by dividing the word '*Satyros*' into *σα Τύρος* [*sa Turos*] (thine is Tyre), and therefore promised that he would triumph over the city. Alexander was led by this interpretation to continue the siege and eventually captured Tyre. The interpretation, which has a sufficiently artificial appearance, was undoubtedly the right one.

(3) I can well imagine that you will be especially impressed when you hear that objections to our view of dreams have even been made by people who have themselves, as psycho-analysts, been engaged for a considerable time in interpreting dreams. It would have been too much to expect that such an abundant encouragement to fresh errors as this theory offers should have been neglected; and so, as a result of conceptual confusions and unjustified generalizations, assertions have been made which are not far behind the medical view of dreams in their incorrectness. You know one of them already. It tells us that dreams are concerned with attempts at adaptation to present conditions and with attempts at solving future problems - that they have a 'prospective purpose' (Maeder). We have already shown that this assertion is based on a confusion between the dream and the latent dream-thoughts and is therefore based on disregarding the dream-work. As a characterization of the unconscious intellectual activity of which the latent dream-thoughts form part, it is on the one hand no novelty and on the other not exhaustive, since unconscious intellectual activity is occupied with many other things besides preparing for the future. A far worse confusion seems to underlie the assurance that the idea of death will be found behind every dream. I am not clear exactly what is meant by this formula. But I suspect that it conceals a confusion between the dream and the dreamer's whole personality.

An unjustifiable generalization, based on a few good examples, is involved in the statement that every dream allows of two interpretations - one which agrees with our account, a 'psycho-analytic' one, and another, an 'anagogic' one, which disregards the instinctual impulses and aims at representing the higher functions of the mind (Silberer). There are dreams of this kind, but you will try in vain to extend this view even to a majority of dreams. Again, after all that I have said to you, you will find quite incomprehensible an assertion that all dreams are to be interpreted bisexually, as a confluence of two currents described as a masculine and a feminine one (Adler). There are, of course, a few dreams of this kind too; and you may learn later that they are constructed like certain hysterical symptoms. The reason why I have mentioned all these discoveries of fresh universal characteristics of dreams is in order to warn you against them or at least to leave you in no doubt as to what I think of them.

(4) One day the objective value of research into dreams seemed to be put in question by an observation that patients under analytic treatment arrange the content of their dreams in accordance with the favourite theories of their physicians some dreaming predominantly of sexual instinctual impulses, others of the struggle for power and yet others even of rebirth (Stekel). The weight of this observation was, however, diminished by the reflection that human beings had dreams before there was any psycho-analytic treatment which could give those dreams a direction, and that people who are now under treatment used also to dream during the period before the treatment started. What was true about this novelty could soon be seen to be self-evident and of no relevance to the theory of dreams. The day's residues which instigate dreams are left over from powerful interests in waking life. When the remarks made by the physician and the hints he gives become of significance to the patient, they enter the circle of the day's residues and can provide psychical stimuli for the construction of dreams like any other emotionally coloured interests of the previous day which have not been dealt with, and they then operate like somatic stimuli which impinge on the sleeper during his sleep. The trains of thought set going by the physician can, like these other instigators of dreams, appear in the manifest content of a dream or be discovered in its latent content. Indeed, we know that a dream can be experimentally produced, or, to put it more correctly, a part of the dream material can be introduced into the dream. In producing these effects on his patients, an analyst is thus playing a part no different from an experimenter who, like Mourly Vold, gives particular postures to the limbs of the subjects of his experiments.

It is often possible to influence dreamers as to what they shall dream *about*, but never as to *what* they shall dream. The mechanism of the dream-work and the unconscious dream wish are exempt from any outside influence. In considering dreams with a somatic stimulus, we have already found that the characteristic nature and independence of dream-life are shown in the reaction with which dreams respond to the somatic or mental stimuli that are brought to bear. The thesis which we have been discussing, and which seeks to throw doubt on the objectivity of research into dreams, is thus once again based on a confusion - this time between the dream and the dream-material.

This then, Ladies and Gentlemen, is what I wanted to tell you about the problems of dreams. As you will guess, there is much that I have had to pass over, and you will have been aware that on almost every point what I have said has necessarily been incomplete. That, however, is due to the connection between the phenomena of dreaming and those of the neuroses. We have studied dreams as an introduction to the theory of the neuroses, and this was certainly a more correct procedure than if we had done the opposite. But just as dreams prepare the way to an understanding of the neuroses, so, on the other hand, a true appreciation of dreams can only be achieved after a knowledge of neurotic phenomena.

I cannot tell what you will think of it, but I must assure you that I do not regret having claimed so much of your interest and of the time available to us for the problems of dreams. There is nothing else from which one can so quickly arrive at a conviction of the correctness of the theses by which psycho-analysis stands or falls. Exacting work over many months and even years is called for to show that the symptoms of a case of neurotic illness have a sense, serve a purpose and arise out of the patient's experiences in life. On the other hand, only a few hours' effort may be enough to prove that the same thing is true of a dream which is, to start with, confused to the point of being unintelligible, and thus to confirm all the premisses of psycho-analysis - the unconscious nature of mental processes, the peculiar mechanisms which they obey and the instinctual forces which are expressed in them. And when we bear in mind the sweeping analogy between the structure of dreams and that of neurotic symptoms and at the same time consider the rapidity of the transformation which makes a dreamer into a waking and reasonable man, we arrive at a certainty that neuroses too are based only on an alteration in the play of forces between the powers of mental life.

Introductory Lectures On Psycho-Analysis

PART III

GENERAL THEORY OF THE NEUROSES

(1917)

LECTURE XVI

PSYCHO-ANALYSIS AND PSYCHIATRY

LADIES AND GENTLEMEN, - I am delighted to see you again, at the beginning of a new academic year, for a resumption of our discussions. Last year I spoke to you of the way in which psycho-analysis deals with parapraxes and dreams. This year I should like to introduce you to an understanding of the phenomena of neurosis, which, as you will soon learn, have a great deal in common with both of the others. But I must warn you in advance that I shall not be able to offer you the same position in relation to me this year as I did last year. At that time I set great store on never taking a step without remaining in agreement with your judgement; I discussed a great deal with you and gave way to your objections - in fact I recognized you and your 'common sense' as a deciding factor. But this is no longer possible and for a simple reason. Parapraxes and dreams were not unfamiliar to you as phenomena; we might say that you had as much experience or could easily obtain as much experience of them as I had. The region of the phenomena of neurosis is, however, strange to you; in so far as you are not doctors yourselves, you have no other access to them than through what I have to tell you; and of what help is the best judgement if it is not accompanied by familiarity with the material that is to be judged?

But you must not take this warning of mine to mean that I propose to give you dogmatic lectures and to insist on your unqualified belief. Such a misunderstanding would do me a grave injustice. I do not wish to arouse conviction; I wish to stimulate thought and to upset prejudices. If as a result of lack of knowledge of the material you are not in a position to form a judgement, you should neither believe nor reject. You should listen and allow what I tell you to work on you. It is not so easy to arrive at convictions, or, if they are reached easily, they soon turn out to be worthless and incapable of resistance. The only person who has a right to a conviction is someone who, like me, has worked for many years at the same material and who, in doing so, has himself had the same new and surprising experiences. What is the good, then, in the sphere of the intellect, of these sudden convictions, these lightning-like conversions, these instantaneous rejections? Is it not clear that the '*coup de foudre*', love at first sight, is derived from quite another sphere, from that of the emotions? We do not even require of our *patients* that they should bring a conviction of the truth of psycho-analysis into the treatment or be adherents of it. Such an attitude often raises our suspicions. The attitude that we find the most desirable in them is a benevolent scepticism. So you too should endeavour to allow the psycho-analytic view to grow up quietly in you alongside of the popular or psychiatric one, till opportunities arise for the two to influence each other, to compete with each other and to unite in leading to a conclusion.

On the other hand, you should not for a moment suppose that what I put before you as the psycho-analytic view is a speculative system. It is on the contrary empirical - either a direct expression of observations or the outcome of a process of working them over. Whether this working-over has been carried out in an adequate and justifiable manner will appear in the course of the further advance of the science, and indeed I may assert without boasting, after a lapse of nearly twenty-five years, and having reached a fairly advanced age, that these observations are the result of particularly hard, concentrated and deep going work. I have often had an impression that our opponents were unwilling to take any account of this origin of our theses, as though they thought what was in question were merely subjectively determined notions to which someone else might oppose others of his own choice. This behaviour of our opponents is not entirely intelligible to me. It may perhaps be due to the fact that, as a doctor, one usually makes so little contact with neurotic patients and pays so little attention to what they say that one cannot imagine the possibility that anything valuable could be derived from their communications - the possibility, that is, of carrying out any thorough observations upon them. I take this opportunity of assuring you that in the course of these lectures I shall indulge in very little controversy, especially with individuals. I have never been able to convince myself of the truth of the maxim that strife is the father of all things. I believe it is derived from the Greek sophists and is at fault, like them, through overvaluing dialectics. It seems to me, on the contrary, that what is known as scientific controversy is on the whole quite unproductive, apart from the fact that it is almost always conducted on highly personal lines. Up to a few years ago I was able to boast that I had only once engaged in a regular scientific dispute - with one single worker (Löwenfeld of Munich). It ended in our becoming friends and we have remained so to this day. But I did not repeat the experiment for a long time, as I did not feel sure that the outcome would be the same.

Now you will no doubt conclude that a rejection such as this of all written discussion argues a high degree of inaccessibility to objections, of obstinacy, or, to use the polite colloquial scientific term, of pig-headedness. I should like to say in reply that when once, after such hard work, one has arrived at a conviction, one has at the same time acquired a certain right to retain that conviction with some tenacity. I may also urge that in the course of my work I have modified my views on a few important points, changed them and replaced them by fresh ones - and in each case, of course, I have made this publicly known. And the outcome of this frankness? Some people have taken no notice whatever of myself - corrections and continue to this day to criticize me for hypotheses which have long ceased to have the same meaning for me. Others reproach me precisely for these changes and regard me as untrustworthy on their account. Of course! a person who has occasionally changed his opinions is deserving of no belief at all, since he has made it all too likely that his latest assertions may also be mistaken; but a person who has unflinchingly maintained what he once asserted, or who cannot be quickly enough persuaded to give it up, must naturally be pig-headed or stubborn! What can one do, in the face of these contradictory objections by the critics, but remain as one is and behave in accordance with one's own judgement? I am resolved to do that, and I shall not be deterred from modifying or withdrawing any of my theories, as my advancing experience may require. In regard to *fundamental* discoveries I have hitherto found nothing to alter, and I hope this will remain true in the future.

I am to put before you, then, the psycho-analytic view of the phenomena of neurosis. In doing so, the best plan would seem to be to make a start in connection with the phenomena we have already dealt with, for the sake both of analogy and contrast; and I will begin with a symptomatic action which I have seen many people perform during my consulting hours. We analysts cannot do much for the people who come to us in our consulting-room to lay before us in a quarter of an hour the miseries of a long lifetime. Our deeper knowledge makes it difficult for us to give the kind of opinion another doctor would - 'There's nothing wrong with you' - with the added advice: 'You should arrange for a mild hydropathic treatment.' One of my colleagues who was asked what he did with his consultation patients shrugged his shoulders and replied: 'I fine them so-and-so many *Kronen* for a frivolous waste of time.' So you will not be surprised to hear that even in the case of busy psycho-analysts their consulting hours are not apt to be very lively. I have had the ordinary door between my waiting-room and my consulting- and treatment-room doubled and given a baize lining. There can be no doubt about the purpose of this arrangement. Now it constantly happens that a person whom I have brought in from the waiting-room omits to shut the door behind him and almost always he leaves *both* doors open. As soon as I notice this I insist in a rather unfriendly tone on his or her going back and making good the omission even if the person concerned is a well-dressed gentleman or a fashionable lady. This makes an impression of uncalled-for pedantry. Occasionally, too, I have put myself in a foolish position by making this request when it has turned out to be a person who cannot touch a door-handle himself and is glad if someone with him spares him the necessity. But in the majority of cases I have been right; for anyone who behaves like this and leaves the door open between a doctor's waiting-room and consulting-room is ill-mannered and deserves an unfriendly reception. But do not take sides over this till you have heard the sequel. For this carelessness on the part of the patient only occurs when he has been alone in the waiting-room and has therefore left an empty room behind him; it never happens if other people, strangers to him, have been waiting with him. In this latter case he knows quite well that it is in his interest not to be overheard while he is talking to the doctor, and he never fails to shut both the doors carefully.

Thus the patient's omission is neither accidentally nor senselessly determined; and indeed it is not unimportant, for, as we shall see, it throws light on the newcomer's attitude to the doctor. The patient is one of the great multitude who have a craving for mundane authority, who wish to be dazzled and intimidated. He may have enquired on the telephone as to the hour at which he could most easily get an appointment; he had formed a picture of a crowd of people seeking for help, like the crowd outside one of Julius Meinl's branches. He now comes into an empty, and moreover extremely modestly furnished, waiting-room, and is shocked. He has to make the doctor pay for the superfluous respect which he had intended to offer him: so - he omits to shut the door between the waiting-room and the consulting-room. What he means to say to the doctor by his conduct is: 'Ah, so there's no one here and no one's likely to come while I'm here.' He would behave equally impolitely and disrespectfully during the consultation if his arrogance were not given a sharp reprimand at the very beginning.

The analysis of this small symptomatic action tells you no thing you did not know before: the thesis that it was not a matter of chance but had a motive, a sense and an intention, that it had a place in an assignable mental context and that it provided information, by a small indication, of a more important mental process. But, more than anything else, it tells you that the process thus indicated was unknown to the consciousness of the person who carried out the action, since none of the patients who left the two doors open would have been able to admit- that by this omission he wanted to give evidence of his contempt. Some of them would probably have been aware of a sense of disappointment when they entered the empty waiting room; but the connection between this impression and the symptomatic action which followed certainly remained unknown to their consciousness.

Beside this small analysis of a symptomatic action we will now place an observation on a patient. I choose this one because it is fresh in my memory, but also because it can be reported comparatively briefly. A certain amount of detail is indispensable in any such account.

A young officer, home on short leave, asked me to undertake the treatment of his mother-in-law, who, though in the happiest circumstances, was embittering her own life and the lives of her relatives through an absurd idea. In this way I made the acquaintance of a well-preserved lady of fifty-three, friendly and simple in her nature, who told me the following story without any reluctance. She lived in the country, most happily married, with her husband, who was at the head of a large factory. She could not give enough praise to her husband's affectionate solicitude. It had been a love-match thirty years ago, and since then there had never been any trouble, discord or cause for jealousy. Her two children were happily married; her husband (and their father), out of a sense of duty, was not yet willing to retire. A year before, she had received an anonymous letter accusing her excellent husband of a love affair with a young girl; and the incredible - and to herself unintelligible - result was that she immediately believed it, and since then her happiness had been destroyed. The course of events, in greater detail, was something like this. She had a housemaid with whom she used, perhaps too often, to have intimate talks. This girl pursued another one with a positively malicious hostility because she had done so much better for herself in life, though she was of no higher origin. Instead of going into service, this other girl had managed to get a commercial training, had entered the factory and, as a result of shortness of personnel, owing to members of the staff being called up for military service, she was promoted to a good position. She now lived in the factory itself, had social relations with all the gentlemen and was actually addressed as 'Fräulein'. The girl who had made less of a success in life was of course ready to repeat all kinds of bad things of her former schoolmate. One day our lady had a conversation with the housemaid about a gentleman who had been staying with them, who was well known not to be living with his wife but to be having an affair with another woman. She did not know how it happened, but she suddenly said: 'The most dreadful thing that could happen to me would be if I were to learn that my dear husband was having an affair too.' The next day she received an anonymous letter by post which, as though by magic, gave her this very information, written in a disguised hand. She decided, probably rightly, that the letter was the work of the malicious housemaid, since it specified as her husband's mistress the girl whom the servant pursued with her hatred. But although she at once saw through the intrigue and had seen enough instances where she lived of how little credence such cowardly denunciations deserved, what happened was that the letter instantly prostrated her. She became terribly excited, sent for her husband at once and reproached him violently. Her husband laughed the accusation off and did the best possible thing. He brought in the family doctor (who was also the factory doctor) who made efforts to soothe the unfortunate lady. The further conduct of both of them was also entirely sensible. The housemaid was dismissed, but the alleged rival was not. Since then the patient had repeatedly been pacified to the point of no longer believing the content of the anonymous letter, but never thoroughly and never for long. It was enough for her to hear the young lady's name mentioned or to meet her in the street and a fresh attack of distrust, pain and reproaches would burst out in her.

This, then, is the case history of this excellent woman. Not much psychiatric experience was needed to understand that, in contrast to other neurotics, she was giving too mild an account of her case - that she was, as we say, - dissimulating and that she had never really got over her belief in the accusation contained in the anonymous letter.

What attitude, then, will a psychiatrist adopt in a case of illness like this? We know already how he would behave to the symptomatic action of the patient who fails to shut the consulting-room door. He pronounces it to be a chance event of no psychological interest with which he has no further concern. But this procedure cannot be carried over to the illness of the jealous woman. The symptomatic action seems to be a matter of indifference; but the symptom forces itself on our attention as a matter of importance. It is accompanied by intense subjective suffering and, as an objective fact, it threatens the communal life of a family; it is thus an undeniable subject of psychiatric interest. The psychiatrist will start by endeavouring to characterize the symptom by some essential feature. The idea with which the woman torments herself cannot in itself be called absurd; it does, indeed, happen that elderly gentlemen have love affairs with young girls. But there is something else about it which *is* absurd and hard to understand. The patient had no other reason at all for believing that her affectionate and loyal husband belonged to this otherwise not so rare class of husbands except what was asserted in the anonymous letter. She knew that this document had no evidential value and she was able to give a satisfying explanation of its origin. She ought therefore to have been able to tell herself that she had no ground whatever for her jealousy, and she did tell herself so. But in spite of this she suffered as much as if she regarded this jealousy as completely justified. Ideas of this kind, which are inaccessible to logical arguments based on reality, are by general agreement described as *delusions*. The good lady, then, was suffering from *delusions of jealousy*. This is no doubt the essential feature of this case of illness.

After this first point has been established our psychiatric interest will become even livelier. If a delusion is not to be got rid of by a reference to reality, no doubt it did not originate from reality either. Where else did it originate? There are delusions of the most varied content: why in our case is the content of the delusion jealousy in particular? In what kind of people do delusions, and especially delusions of jealousy, come about? We should like to hear what the psychiatrist has to say about this; but at this point he leaves us in the lurch. He enters into only a single one of our enquiries. He will investigate the woman's family history and will *perhaps* give us this reply: 'Delusions come about in people in whose families similar and other psychical disorders have repeatedly occurred.' In other words, if this woman developed a delusion she was predisposed to it by hereditary transmission. No doubt that is something; but is it all we want to know? Was this the only thing that contributed to the causation of the illness? Must we be content to suppose that it is a matter of indifference or caprice or is inexplicable whether a delusion of jealousy arises rather than any other sort? And ought we to understand the assertion of the predominance of the hereditary influence in a negative sense as well - that no matter what experiences this woman's mind encountered she was destined some time or other to produce a delusion? You will want to know why it is that scientific psychiatry will give us no further information. But my reply to you is: 'he is a rogue who gives more than he has.' The psychiatrist knows no way of throwing more light on a case like this one. He must content himself with a diagnosis and a prognosis - uncertain in spite of a wealth of experience - of its future course.

But can psycho-analysis do more here? Yes, it actually can. I hope to be able to show you that, even in a case so hard of access as this, it can discover something which makes a first understanding possible. And to begin with I would draw your attention to the inconspicuous detail that the patient herself positively provoked the anonymous letter, which now gave support to her delusion, by informing the scheming housemaid on the previous day that it would cause her the greatest unhappiness if her husband had a love affair with a young girl. In this way she first put the notion of sending the anonymous Letter into the housemaid's head. Thus the delusion acquires a certain independence of the letter; it had been present already in the patient as a fear - or was it as a wish? Let us now add to this the small further indications yielded by only two analytic sessions. The patient, indeed, behaved in a very unco-operative way when, after telling me her story, she was asked for her further thoughts, ideas and memories. She said that nothing occurred to her, that she had told me everything already, and after two sessions the experiment with me had in fact to be broken off because she announced that she already felt well and that she was sure the pathological idea would not come back. She only said this, of course, from resistance and from dread of the continuation of the analysis. Nevertheless, during these two sessions she let fall a few remarks which allowed of, and indeed necessitated, a particular interpretation; and this interpretation threw a clear light on the genesis of her delusion of jealousy. She herself was intensely in love with a young man, with the same son-in-law who had persuaded her to come to me as a patient. She herself knew nothing, or perhaps only a very little, of this love; in the family relationship that existed between them it was easy for this passionate liking to disguise itself as innocent affection. After all our experiences elsewhere, it is not hard for us to feel our way into the mental life of this upright wife and worthy mother, of the age of fifty-three. Being in love like this, a monstrous and impossible thing, could not become conscious; but it remained in existence and, even though it was unconscious, it exercised a severe pressure. Something had to become of it, some relief had to be looked for; and the easiest mitigation was offered, no doubt, by the mechanism of displacement which plays a part so regularly in the generating of delusional jealousy. If not only were she, the old woman, in love with a young man, but if also her old husband were having a love affair with a young girl, then her conscience would be relieved of the weight of her unfaithfulness. The phantasy of her husband's unfaithfulness thus acted as a cooling compress on her burning wound. Her own love had not become conscious to her, but its mirror-reflection, which brought her such an advantage, now became conscious as an obsession and delusion. No arguments against it could, of course, have any effect, for they were only directed against the mirror-image and not against the original which gave the other its strength and which lay hidden, inviolable, in the unconscious.

Let us now bring together what this effort at a psycho-analysis, short and impeded as it was, has brought to light for an understanding of this case - assuming, of course, that our enquiries were correctly carried out, which I cannot here submit to your judgement. Firstly, the delusion has ceased to be absurd or unintelligible; it had a sense, it had good motives and it fitted into the context of an emotional experience of the patient's. Secondly, the delusion was necessary, as a reaction to an unconscious mental process which we have inferred from other indications, and it was precisely to this connection that it owed its delusional character and its resistance to every logical and realistic attack. It itself was something desired, a kind of consolation. Thirdly, the fact that the delusion turned out to be precisely a jealous one and not one of another kind was unambiguously determined by the experience that lay behind the illness. You recall of course that, the day before, she had told the scheming maid that the most dreadful thing that could happen to her would be her husband's unfaithfulness. Nor will you have overlooked the two important analogies between this case and the symptomatic action which we analysed - the explanation of its sense or intention and its relation to something unconscious that was involved in the situation.

Naturally this does not answer all the questions that we might ask in connection with this case. On the contrary, the case bristles with further problems-some that have in general not yet become soluble and others which could not be solved owing to the particular circumstances being unfavourable. For instance, why did this lady who was happily married fall in love with her son-in-law? and why did the relief, which might have been possible in other ways, take the form of this mirror-image this projection of her state on to her husband? You must not think it is otiose or frivolous to raise such questions. We already have some material at our disposal which might possibly serve to answer them. The lady was at a critical age, at which sexual needs in women suffer a sudden and undesired increase; that alone might account for the event. Or it may further have been that her excellent and faithful husband had for some years no longer enjoyed the sexual capacity which the well-preserved woman required for her satisfaction. Experience has shown us that it is precisely men in this position, whose faithfulness can consequently be taken for granted, who are distinguished by treating their wives with unusual tenderness, and by showing particular forbearance for their nervous troubles. Or, again, it may not be without significance that the object of this pathogenic love was precisely the young husband of one of her daughters. A powerful erotic tie with a daughter, which goes back in the last resort to the mother's sexual constitution, often finds a way of persisting in a transformation of this sort. In this connection I may perhaps remind you that the relation between mother-in-law and son-in-law has been regarded from the earliest times of the human race as a particularly awkward one and that among primitive people it has given rise to very powerful taboo regulations and 'avoidances'. The relation is frequently excessive by civilized standards both in a positive and negative direction. Which of these three factors became operative in our case, or whether two of them or perhaps all three came together, I cannot, it is true, tell you; but that is only because I was not permitted to continue the analysis of the case for more than two sessions.

I notice now, Gentlemen, that I have been talking to you about a number of things which you are not yet prepared to understand. I did so in order to carry out the comparison between psychiatry and psycho-analysis. But there is one thing that I can ask you now. Have you observed any sign of a contradiction between them? Psychiatry does not employ the technical methods of psycho-analysis; it omits to make any inferences from the *content* of the delusion, and, in pointing to heredity, it gives us a very general and remote aetiology instead of indicating first the more special and proximate causes. But is there a contradiction, an opposition in this? Is it not rather a case of one supplementing the other? Does the hereditary factor contradict the importance of experience? Do not the two things rather combine in the most effective manner? You will grant that there is nothing in the nature of psychiatric work which could be opposed to psycho-analytic research. What is opposed to psycho-analysis is not psychiatry but psychiatrists. Psycho-analysis is related to psychiatry approximately as histology is to anatomy: the one studies the external forms of the organs, the other studies their construction out of tissues and cells. It is not easy to imagine a contradiction between these two species of study, of which one is a continuation of the other. To-day, as you know, anatomy is regarded by us as the foundation of scientific medicine. But there was a time when it was as much forbidden to dissect the human cadaver in order to discover the internal structure of the body as it now seems to be to practise psycho-analysis in order to learn about the internal mechanism of the mind. It is to be expected that in the not too distant future it will be realized that a scientifically based psychiatry is not possible without a sound knowledge of the deeper-lying unconscious processes in mental life.

Perhaps, however, the much-abused psycho-analysis has friends among you who will be pleased if it can be justified from another direction - from the therapeutic side. As you know, our psychiatric therapy is not hitherto able to influence delusions. Is it possible, perhaps, that psycho-analysis can do so, thanks to its insight into the mechanism of these symptoms? No, Gentlemen, it cannot. It is as powerless (for the time being at least) against these ailments as any other form of therapy. We can understand, indeed, what has happened in the patient, but we have no means of making the patient himself understand it. You have heard how I was unable to pursue the analysis of this delusion beyond a first beginning. Will you be inclined to maintain on that account that an analysis of such cases is to be rejected because it is fruitless? I think not. We have a right, or rather a duty, to carry on our research without consideration of any immediate beneficial effect. In the end - we cannot tell where or when - every little fragment of knowledge will be transformed into power, and into therapeutic power as well. Even if psycho-analysis showed itself as unsuccessful in every other form of nervous and psychical disease as it does in delusions, it would still remain completely justified as an irreplaceable instrument of scientific research. It is true that in that case we should not be in a position to practise it. The human material on which we seek to learn, which lives, has its own will and needs its motives for co-operating in our work, would hold back from us. Let me therefore end my remarks to-day by informing you that there are extensive groups of nervous disorders in which the transformation of our better understanding into therapeutic power has actually taken place, and that in these illnesses, which are difficult of access by other means, we achieve, under favourable conditions, successes which are second to no others in the field of internal medicine.

LECTURE XVII

THE SENSE OF SYMPTOMS

LADIES AND GENTLEMEN, - In the last lecture I explained to you that clinical psychiatry takes little notice of the outward form or content of individual symptoms, but that psycho-analysis takes matters up at precisely that point and has established in the first place the fact that symptoms have a sense and are related to the patient's experiences. The sense of neurotic symptoms was first discovered by Josef Breuer from his study and successful cure (between 1880 and 1882) of a case of hysteria which has since become famous. It is true that Pierre Janet brought forward the same evidence independently; indeed, the French worker can claim priority of publication, for it was only a decade later (in 1893 and 1895), while he was collaborating with me, that Breuer published his observation. In any case it may seem a matter of some indifference who made the discovery, for, as you know, every discovery is made more than once and none is made all at once. And, apart from this, success does not always go along with merit: America is not named after Columbus. The great psychiatrist Leuret gave it as his opinion, before Breuer and Janet, that even the delusional ideas of the insane would certainly be found to have a sense if only we understood how to translate them. I must admit that for a long time I was prepared to give Janet very great credit for throwing light on neurotic symptoms, because he regarded them as expressions of *idées inconscientes* which dominated the patients. But since then he has expressed himself with exaggerated reserve, as if he wanted to admit that the unconscious had been nothing more to him than a form of words, a make shift, *une façon de parler* - that he had meant nothing real by it. Since then I have ceased to understand Janet's writings; but I think he has unnecessarily forfeited much credit.

Thus neurotic symptoms have a sense, like parapraxes and dreams, and, like them, have a connection with the life of those who produce them. I should now like to make this important discovery plainer to you by a few examples. I can indeed only assert, I cannot prove, that it is always and in every instance so. Anyone who looks for experiences himself, will find convincing evidence. But for certain reasons I shall choose these examples from cases not of hysteria but of another, highly remarkable neurosis which is fundamentally very much akin to it and about which I have a few introductory remarks to make.

This neurosis, known as 'obsessional neurosis', is not so popular as the universally familiar hysteria. It is not, if I may express myself thus, so obtrusively noisy, it behaves more like a private affair of the patient's, it dispenses almost entirely with somatic phenomena, and creates all its symptoms in the mental sphere. Obsessional neurosis and hysteria are the forms of neurotic illness upon the study of which psycho-analysis was first built, and in the treatment of which, too, our therapy celebrates its triumphs. But obsessional neurosis, in which the puzzling leap from the mental to the physical plays no part, has actually, through the efforts of psycho-analysis, become more perspicuous and familiar to us than hysteria, and we have learnt that it displays certain extreme characteristics of the nature of neurosis far more glaringly.

Obsessional neurosis is shown in the patient's being occupied with thoughts in which he is in fact not interested, in his being aware of impulses in himself which appear very strange to him and in his being led to actions the performance of which give him no enjoyment, but which it is quite impossible for him to omit. The thoughts (obsessions) may be senseless in themselves, or merely a matter of indifference to the subject; often they are completely silly, and invariably they are the starting-point of a strenuous mental activity, which exhausts the patient and to which he only surrenders himself most unwillingly. He is obliged against his will to brood and speculate as though it were a question of his most important vital problems. The impulses which the patient is aware of in himself may also make a childish and senseless impression; but as a rule they have a content of the most frightful kind, tempting him, for instance, to commit serious crimes, so that he not merely disavows them as alien to himself, but flies from them in horror and protects himself from carrying them out by prohibitions, renunciations and restrictions upon his freedom. At the same time, these impulses never - literally never - force their way through to performance; the outcome lies always in victory for the flight and the precautions. What the patient actually carries out - his so called obsessional actions - are very harmless and certainly trivial things, for the most part repetitions or ceremonial elaborations of the activities of ordinary life. But these necessary activities (such as going to bed, washing, dressing or going for a walk) become extremely tedious and almost insoluble tasks. In different forms and cases of obsessional neurosis the pathological ideas, impulses and actions are not combined in equal proportions; it is the rule, rather, that one or other of these factors dominates the picture and gives its name to the illness, but the common element in all these forms is sufficiently unmistakable.

Certainly this is a crazy illness. The most extravagant psychiatric imagination would not, I think, have succeeded in constructing anything like it; and if one did not see it before one every day one would never bring oneself to believe in it. Do not suppose, however, that you will help the patient in the least by calling on him to take a new line, to cease to occupy himself with such foolish thoughts and to do something sensible instead of his childish pranks. He would like to do so himself, for he is completely clear in his head, shares your opinion of his obsessional symptoms and even puts it forward to you spontaneously. Only he cannot help himself. What is carried into action in an obsessional neurosis is sustained by an energy to which we probably know nothing comparable in normal mental life. There is only one thing he can do: he can make displacements, and exchanges, he can replace one foolish idea by another somewhat milder, he can proceed from one precaution or prohibition to another, instead of one ceremonial he can perform another. He can displace the obsession but not remove it. The ability to displace any symptom into something far removed from its original conformation is a main characteristic of his illness. Moreover it is a striking fact that in his condition the contradictions (polarities) with which mental life is interlaced emerge especially sharply differentiated. Alongside of obsessions with a positive and negative content, *doubt* makes itself felt in the intellectual field and little by little it begins to gnaw even at what is usually most certain. The whole position ends up in an ever-increasing degree of indecision, loss of energy and restriction of freedom. At the same time, the obsessional neurotic starts off with a very energetic disposition, he is often extraordinarily self-willed and as a rule he has intellectual gifts above the average. He has usually reached a satisfactorily high level of ethical development; he exhibits over-conscientiousness, and is more than ordinarily correct in his behaviour. You can imagine that no small amount of work is needed before one can make one's way any distance into this contradictory hotch-potch of character-traits and symptoms. And to begin with we aim at nothing whatever else than understanding a few of the symptoms and being able to interpret them.

Perhaps you would like to know in advance, having in mind our earlier talks, what attitude contemporary psychiatry adopts towards the problems of obsessional neurosis. But it is a meagre chapter. Psychiatry gives names to the different obsessions but says nothing further about them. On the other hand it insists that those who suffer from these symptoms are 'degenerates'. This gives small satisfaction; in fact it is a judgement of value a condemnation instead of an explanation. We are supposed to think that every possible sort of eccentricity may arise in degenerates. Well, it is true that we must regard those who develop such symptoms as somewhat different in their nature from other people. But we may ask: are they more 'degenerate' than other neurotics - than hysterical patients, for instance, or those who fall ill of psychoses? Once again, the characterization is evidently too general. Indeed, we may doubt whether there is any justification for it at all, when we learn that such symptoms occur too in distinguished people of particularly high capacities, capacities important for the world at large. It is true that, thanks to their own discretion and to the untruthfulness of their biographers, we learn little that is intimate about the great men who are our models; but it may nevertheless happen that one of them, like Émile Zola, may be a fanatic for the truth, and we then learn from him of the many strange obsessional habits to which he was a life-long victim.¹

¹ E. Toulouse, *Émile Zola, enquête médico-psychologique*, Paris, 1896.

Psychiatry has found a way out by speaking of '*dégénérés supérieurs*'. Very nice. But we have found from psycho-analysis that it is possible to get permanently rid of these strange obsessional symptoms, just as of other complaints and just as in people who are not degenerate. I myself have succeeded repeatedly in this.

I shall give you only two examples of the analysis of an obsessional symptom: one an old observation which I cannot find a better one to replace, and another recently met with. I limit myself to this small number, because it is impossible in such reports to avoid being very diffuse and entering into every detail.

A lady, nearly thirty years of age, who suffered from the most severe obsessional manifestations and whom I might perhaps have helped if a malicious chance had not brought my work to nothing - I may be able to tell you more about this later on performed (among others) the following remarkable obsessional action many times a day. She ran from her room into another neighbouring one, took up a particular position there beside a table that stood in the middle, rang the bell for her housemaid, sent her on some indifferent errand or let her go without one, and then ran back into her own room. This was certainly not a very distressing symptom, but was nevertheless calculated to excite curiosity. The explanation was reached in the most unequivocal and unobjectionable manner, free from any possible contribution on the doctor's part. I cannot see how I could possibly have formed any suspicion of the sense of this obsessional action or could have offered any suggestion on how it was to be interpreted. Whenever I asked the patient 'Why do you do that? What sense has it?' she answered: 'I don't know.' But one day, after I had succeeded in defeating a major, fundamental doubt of hers, she suddenly knew the answer and told me what it was that was connected with the obsessional action. More than ten years before, she had married a man very much older than herself, and on the wedding-night he was impotent. Many times during the night he had come running from his room into hers to try once more, but every time without success. Next morning he had said angrily: 'I should feel ashamed in front of the housemaid when she makes the bed,' took up a bottle of red ink that happened to be in the room and poured its contents over the sheet, but not on the exact place where a stain would have been appropriate. I could not understand at first what this recollection had to do with the obsessional action in question; the only resemblance I could find was in the repeated running from one room into the other, and perhaps also in the entrance of the housemaid. My patient then led me up to the table in the second room and showed me a big stain on the tablecloth. She further explained that she took up her position in relation to the table in such a way that the maid who had been sent for could not fail to see the stain. There could no longer be any doubt of the intimate connection between the scene on her wedding-night and her present obsessional action, though all kinds of other things remained to be learnt.

It was clear, in the first place, that the patient was identifying herself with her husband; she was playing his part by imitating his running from one room into the other. Further, to carry on the analogy, we must agree that the bed and the sheet were replaced by the table and the tablecloth. This might seem arbitrary, but surely we have not studied dream-symbolism to no purpose. In dreams too we often find a table which has to be interpreted as a bed. Table and bed together stand for marriage, so that the one can easily take the place of the other.

It already seems proved that the obsessional action had a sense; it appears to have been a representation, a repetition, of the significant scene. But we are not obliged to come to a halt here. If we examine the relation between the two more closely, we shall probably obtain information about something that goes further - about the intention of the obsessional action. Its kernel was obviously the summoning of the housemaid, before whose eyes the patient displayed the stain, in contrast to her husband's remark that he would feel ashamed in front of the maid. Thus he, whose part she was playing, did not feel ashamed in front of the maid; accordingly the stain was in the right place. We see, therefore, that she was not simply repeating the scene, she was continuing and at the same time correcting it; she was putting it right. But by this she was also correcting the other thing, which had been so distressing that night and had made the expedient with the red ink necessary - his impotence. So the obsessional action was saying: 'No, it's not true. He had no need to feel ashamed in front of the housemaid; he was not impotent.' It represented this wish, in the manner of a dream, as fulfilled in a present-day action; it served the purpose of making her husband superior to his past mishap.

Everything I could tell you about this woman fits in with this. Or, more correctly speaking, everything else we know about her points the way to this interpretation of what was in itself an unintelligible obsessional action. The woman had been living apart from her husband for years and was struggling with an intention to obtain a legal divorce. But there was no question of her being free of him; she was forced to remain faithful to him; she withdrew from the world so as not to be tempted; she exculpated and magnified his nature in her imagination. In deed, the deepest secret of her illness was that by means of it she protected her husband from malicious gossip, justified her separation from him and enabled him to lead a comfortable separate life. Thus the analysis of a harmless obsessional action led directly to the inmost core of an illness, but at the same time betrayed to us no small part of the secret of obsessional neurosis in general. I am glad to let you dwell a little on this example because it combines conditions which we could not fairly expect to find in every case. Here the interpretation of the symptom was discovered by the patient herself at a single blow, without any prompting or intervention on the analyst's part; and it resulted from a connection with an event which did not (as is usually the case) belong to a forgotten period of childhood, but which had happened in the patient's adult life and had remained undimmed in her memory. All the objections which criticism is normally in the habit of raising against our interpretation of symptoms fall to the ground in this particular case. We cannot hope always to have such good luck.

And one thing more. Were you not struck by the way in which this unobtrusive obsessional action has led us into the intimacies of the patient's life? A woman cannot have anything much more intimate to tell than the story of her wedding-night. Is it a matter of chance and of no further significance that we have arrived precisely at the intimacies of sexual life? No doubt it might be the result of the choice I have made on this occasion. Do not let us be too hasty in forming our judgement, and let us turn to my second example, which is of quite a different kind - a sample of a very common species, a sleep-ceremonial.

A nineteen-year-old girl, well developed and gifted, was the only child of parents to whom she was superior in education and intellectual liveliness. As a child she had been wild and high spirited, and in the course of the last few years had changed, without any visible cause, into a neurotic. She was very irritable, particularly towards her mother, always dissatisfied and depressed, and inclined to indecisiveness and doubt; finally she admitted that she was no longer able to walk by herself across squares or along comparatively wide streets. We will not concern ourselves much with her complicated illness, which called for at least two diagnoses - agoraphobia and obsessional neurosis - but will dwell only on the fact that she also developed a sleep-ceremonial, with which she tormented her parents. In a certain sense it may be said that every normal person has his sleep-ceremonial or that he has established certain necessary conditions the non-fulfilment of which interferes with his going to sleep; he has imposed certain forms on the transition from the waking to the sleeping state and repeats them in the same manner every evening. But everything that a healthy person requires as a necessary condition for sleep can be understood rationally, and if external circumstances call for a change he will comply easily and without waste of time. A pathological ceremonial, however, is unyielding and insists on being carried through, even at the cost of great sacrifices; it too is screened by having a rational basis and at a superficial glance seems to diverge from the normal only by a certain exaggerated meticulousness. On closer examination, nevertheless, we can see that the screen is insufficient, that the ceremonial comprises some stipulations which go far beyond its rational basis and others which positively run counter to it. Our present patient put forward as a pretext for her nightly precautions that she needed quiet in order to sleep and must exclude every source of noise. With that end in view she did two kinds of things. The big clock in her room was stopped, all the other clocks or watches in the room were removed, and her tiny wrist-watch was not allowed even to be inside her bedside table. Flower-pots and vases were collected on the writing-table so that they might not fall over in the night and break, and disturb her in her sleep. She was aware that these measures could find only an *ostensible* justification in the rule in favour of quiet: the ticking of the little watch would not have been audible even if it had been left lying on the top of the bedside table, and we have all had experience of the fact that the regular ticking of a pendulum-clock never disturbs sleep but acts, rather, as a soporific. She admitted too that her fear that flower-pots and vases, if they were left in their places, might fall over and break of their own accord lacked all plausibility. In the case of other stipulations made by the ceremonial the need for quiet was dropped as a basis. Indeed, the requirement that the door between her room and her parents' bedroom should stay half-open - the fulfilment of which she ensured by placing various objects in the open doorway - seemed on the contrary to act as a source of disturbing noises. But the most important stipulations related to the bed itself. The pillow at the top end of the bed must not touch the wooden back of the bedstead. The small top pillow must lie on this large pillow in one specific way only - namely, so as to form a diamond shape. Her head had then to lie exactly along the long diameter of the diamond. The eiderdown (or '*Duchent*' as we call it in Austria) had to be shaken before being laid on the bed so that its bottom end became very thick; afterwards, however, she never failed to even out this accumulation of feathers by pressing them apart.

With your leave I will pass over the remaining, often very trivial, details of the ceremonial; they would teach us nothing new, and would lead us too far afield from our aims. But you must not overlook the fact that all this was not carried out smoothly. There was always an apprehension that things might not have been done properly. Everything must be checked and repeated, doubts assailed first one and then another of the safety measures, and the result was that one or two hours were spent, during which the girl herself could not sleep and would not allow her intimidated parents to sleep either.

The analysis of these torments did not proceed so simply as that of our earlier patient's obsessional action. I was obliged to give the girl hints and propose interpretations, which were always rejected with a decided 'no' or accepted with contemptuous doubt. But after this first reaction of rejection there followed a time during which she occupied herself with the possibilities put before her, collected associations to them, produced recollections and made connections, until by her own work she had accepted all the interpretations. In proportion as this happened, she relaxed the performance of her obsessional measures, and even before the end of the treatment she had given up the whole ceremonial. You must understand, too, that the work of analysis as we carry it out to-day quite excludes the systematic treatment of any individual symptom till it has been entirely cleared up. We are, on the contrary, obliged to keep on leaving any particular topic, in the certain expectation of coming back to it again in other connections. The interpretation of her symptoms which I am about to give you is accordingly a synthesis of findings which were arrived at, interrupted by other work, over a period of weeks and months.

Our patient gradually came to learn that it was as symbols of the female genitals that clocks were banished from her equipment for the night. Clocks and watches - though elsewhere we have found other symbolic interpretations for them - have arrived at a genital role owing to their relation to periodic processes and equal intervals of time. A woman may boast that her menstruation behaves with the regularity of clockwork. Our patient's anxiety, however, was directed in particular against being disturbed in her sleep by the ticking of a clock. The ticking of a clock may be compared with the knocking or throbbing in the clitoris during sexual excitement. She had in fact been repeatedly woken from her sleep by this sensation, which had now become distressing to her; and she gave expression to this fear of an erection in the rule that all clocks and watches that were going should be removed from her neighbourhood at night. Flower-pots and vases, like all vessels, are also female symbols. Taking precautions against their falling and being broken at night was thus not without its good sense. We know the widespread custom of breaking a vessel or plate at betrothal ceremonies. Each man present gets hold of a fragment, and we may regard this as a sign of his resigning the claims he had upon the bride in virtue of a marriage-regulation dating from before the establishment of monogamy. In connection with this part of her ceremonial the girl produced a recollection and several associations. Once when she was a child she had fallen down while she was carrying a glass or china vase and had cut her finger and bled profusely. When she grew up and came to know the facts about sexual intercourse she formed an anxious idea that on her wedding-night she would not bleed and would thus fail to show that she was a virgin. Her precautions against vases being broken thus meant a repudiation of the whole complex concerned with virginity and bleeding at the first intercourse - a repudiation equally of the fear of bleeding and of the contrary fear of not bleeding. These precautions, which she subsumed under her avoidance of noise, had only a remote connection with it.

She found out the central meaning of her ceremonial one day when she suddenly understood the meaning of the rule that the pillow must not touch the back of the bedstead. The pillow, she said, had always been a woman to her and the upright wooden back a man. Thus she wanted - by magic, we must interpolate - to keep the man and woman apart - that is, to separate her parents from each other, not to allow them to have sexual intercourse. In earlier years, before she had established the ceremonial, she had tried to achieve the same aim in a more direct way. She had simulated fear (or had exploited a tendency to fear which was already present) in order that the connecting doors between her parents' bedroom and the nursery should not be shut. This rule had, indeed, been retained in her present ceremonial. In that way she gave herself the opportunity of listening to her parents, but in making use of it she brought on an insomnia which lasted for months. Not satisfied with disturbing her parents by this means, she contrived to be allowed from time to time to sleep in her parents' bed between them. The 'pillow' and the 'wooden back' were thus really unable to come together. Finally, when she was so big that it became physically uncomfortable for her to find room in the bed between her parents, she managed, by a conscious simulation of anxiety, to arrange for her mother to exchange places with her for the night and to leave her own place so that the patient could sleep beside her father. This situation no doubt became the starting-point of phantasies whose after-effect was to be seen in the ceremonial.

If a pillow was a woman, then the shaking of the eiderdown till all the feathers were at the bottom and caused a swelling there had a sense as well. It meant making a woman pregnant; but she never failed to smooth away the pregnancy again, for she had for years been afraid that her parents' intercourse would result in another child and so present her with a competitor. On the other hand, if the big pillow was a woman, the mother, then the small top-pillow could only stand for the daughter. Why did this pillow have to be placed diamond-wise and her head precisely along its centre line? It was easy to recall to her that this diamond shape is the inscription scribbled on every wall to represent the open female genitals. If so, she herself was playing the man and replacing the male organ by her head. (Cf. the symbolism of beheading for castrating.)

Wild thoughts, you will say, to be running through an unmarried girl's head. I admit that is so. But you must not forget that I did not make these things but only interpreted them. A sleep-ceremonial like this is a strange thing too, and you will not fail to see how the ceremonial corresponds to the phantasies which are revealed by the interpretation. But I attach more importance to your noticing that what was seen in the ceremonial was a precipitate not of a *single* phantasy but of a number of them, though they had a nodal point somewhere, and, further, that the rules laid down by the ceremonial reproduced the patient's sexual wishes at one point positively and at another negatively - in part they represented them, but in part they served as a defence against them.

More could be made, too, of the analysis of this ceremonial if it could be properly linked up with the patient's other symptoms. But our path does not lead in that direction. You must be content with a hint that the girl was in the grip of an erotic attachment to her father whose beginnings went back to her childhood. Perhaps that was why she behaved in such an unfriendly way to her mother. Nor can we overlook the fact that the analysis of this symptom has once again taken us back to a patient's sexual life. We shall perhaps be less surprised at this the more often we gain an insight into the sense and intention of neurotic symptoms.

I have shown you, then, on the basis of two chosen examples, that neurotic symptoms have a sense, like parapraxes and dreams, and that they have an intimate connection with the patient's experiences. Can I expect you to believe this extremely important thesis on the evidence of two examples? No. But can you require me to go on giving you further examples till you declare yourselves convinced? No, once more. For, in view of the detailed fashion in which I deal with each single case, I should have to devote a five-hour course of lectures to settling this one point in the theory of the neuroses. So I must be content with having given you a trial proof of my assertion and, for the rest, I refer you to the reports given in the literature of the subject - to the classical interpretations of symptoms in Breuer's first case (of hysteria), to the striking light thrown upon the most obscure symptoms of what is known as dementia praecox by C. G. Jung, at a time when he was merely a psycho-analyst and had not yet aspired to be a prophet, and all the other papers that have since then filled our periodicals. There has been no lack of investigations precisely on these lines. The analysis, interpretation and translation of neurotic symptoms proved so attractive to psycho-analysts that for a time they neglected the other problems of neurosis.
